On Monday the 10th of December, we weighed anchor, and set sail with the Tamar in company, being saluted, on our leaving the road, by the English ship, the Dutch Commodore and the fort. We passed by the Thousand Islands, which extend along the north-side of Java, almost to the west point of New Guinea. Commodore Roggewein sailing through the midst of them, and finding it impossible to count them, gave them, we are told, the general name of the Thousand Islands. They are inhabited by a savage people of a black complexion, who are almost naked, and these islands are famous for producing a beautiful kind of bird, known among us by the name of the bird of paradise. We also passed by a multitude of other small islands, commonly called the Bed of Roses. After which we entered the Straits of Sunday, where the land on each side is very high, both on the shore of the island of Sumatra, and that of Java, the passage between which constitutes the Straits of Sunda. The land of the last mentioned island is very irregular, and the inhabitants extremely poor. They trafficked with us chiefly for old cloaths; and we had an opportunity of supplying ourselves with a great quantity of the finest green turtle, fowls, and fruit of all kinds. The Commodore bought for 10 rixdollars, as many turtle as weighed upwards of 1000 pounds weight, part of which he gave to our ship's company, and also sent a part to that of the Tamar. On the 14th, at seven in the evening, we came to an anchor on the north-side of Prince's Island, which lies within the fourth entrance of the straits, in order to recruit our wood and water. We found this island well stocked with provisions of all kinds, and particularly fowls. The inhabitants are to all appearance free from the dominion of the Dutch; though according to the accounts given by the natives, they often fall victims to their unprovoked cruelties, as they frequently seize them, and reduce them to the condition of slaves; and even sell them in the same manner, as the negroes are purchased on the coast of Guinea. We lay off this island till the 19th, during which time, we repaired an inconsiderable damage the Dolphin had sustained, by having had some pieces of copper torn off the larboard bow, by the small bower anchor. This done, and having taken in as much wood and water as we could stow, we weighed, and, working to the windward, before night got without Java Head. By this time a putrid fever raged among our crew, whereof three of our hands died, and many others lay in so dangerous a condition that we had little hopes of their recovery. On the 25th, being Christmas-day, our people were in high spirits, and not a little troublesome; but at this time we had an accident which gave us some concern. William Walter, a quarter gunner, was sitting asleep with a pipe in his mouth, and fell overboard; when, notwithstanding all possible means were used to save him, he was never seen more. This unfortunate man was a very good seaman, and universally respected by the officers and all on board.

On Monday the 10th of February, at A. D. 1766. six o'clock, A. M. we came in sight of the coast of Africa, in latitude 34 deg. 15 min. south, and in 21 deg. 45 min. east longitude. On the 12th, at three P. M. we made land to the eastward of Cape d'Aguilas,

d'Aguilas, but had contrary winds for several days together. From hence the coast lies W. N. W. to the Cape of Good Hope, distant about 30 leagues. On the 13th, we passed between Penguin Island and Green Point, and at three o'clock, P. M. came to an anchor in Table Bay, with a fresh gale, working to windward under a close reefed main and top-sails, and there found some light Dutch ships and Indiamen, bound for Europe. In this bay the S. E. wind blew so strong, as to oblige us to lie with our yards and top-masts struck; and it was sometimes with the greatest difficulty that our boats reached the shore, through the violence of the squalls, which at particular times are here so great, as to drive ships from their anchors out to sea. On our entering the bay we saluted the fort, which compliment was immediately returned; and on Friday the 14th, the Commodore waited upon the governor, who sent his coach and six to the water-side to receive him. The Cape is a most excellent place for ships to touch at; it is a healthy climate, a fine country, and abounds with refreshments of every kind. The Company's garden is a delightful spot, and at the end of it is a paddock belonging to the governor, in which are kept a great number of very curious animals; among others were three fine ostriches, and four zebras of an uncommon size. The square, in which the old governor lives, is encompassed by many other grand buildings, besides what is appropriated to the use of that great officer, who here appears with the dignity of a prince. Our Commodore during his stay, resided in a house adjoining to the governor's, where he had a centinel always at the door, and a serjeant who attended him whenever he went abroad. In the middle of this square is a very fine fountain, which supplies the greatest part of the town with water. The officers of both ships resided chiefly at Mr. Prince's, and as for a long time we had enjoyed no recreation, we now spent our time very agreeably. The people also on board had all leave to go on shore by turns, and they always contrived to get completely drunk with Cape wine before they returned. This was chiefly owing to the civility of the inhabitants, who as they depend on the foreign ships who touch here, think it their interest to behave with good manners, and extraordinary complaisance to all strangers. During the time we continued at the Cape, which was three weeks, all on board both ships were supplied with fresh mutton and beef; for provisions are so cheap, that a sheep may be bought for a Spanish dollar, which, when cleared of the offal, will weigh 50 or 60 pounds. Their tails, which are remarkably large, are chiefly composed of fat, which eats like marrow. Their skins are not covered with wool, as ours in England, but with a kind of down, intermixed with long hair. The bullocks are large, and used for the most part in teams, for which they are preferred to horses; eight or ten of them being harnessed together, and conducted by a slave, who goes before to guide them. The horses are small, but very spirited: and we were told an odd circumstance concerning them, which is, that they are never known to lie down but when sick, and that this is an infallible sign by which their owners know when they are out of order.

With respect to the country in general, it is situated in 35 deg. of south latitude, and in a temperate climate, where the extremes of heat and cold are equally unknown. It abounds with the most beautiful landscapes, the skirts of the mountains being interspersed with lofty groves of the finest trees, and the valleys and plains consist of delightful meadow lands, adorned with a variety of the most beautiful flowers, that fill the air with their fragrance. The land also produces the finest vegetable productions, and the richest fruits, while most of those brought from the East and West Indies, flourish here as well as in their native soil. One of the most beautiful, and a native, is the aloe, of which are many sorts, seen not only in the gardens of the company, but in the clefts of the rocks, and, it is said, that throughout the year, one sort or other is continually in bloom. The Indian gold-tree is likewise a remarkable curiosity, having gold-coloured leaves speckled with red, with small greenish

blossoms. Here are also numbers of quince-trees, whose fruit is said to be not only larger, but better than the quinces of any other country in the known world. The Dutch have discovered several excellent methods of preserving them, and not only make great quantities of marmalade for their own use, but sell it to the ships that touch here for refreshments. No country abounds with a greater variety of animals. Among the wild beasts are the elephant, the rhinoceros, and the buffalo, with lions, tigers, leopards, wolves, wild dogs, porcupines, elks, harts, goats of various kinds, wild horses, the zebra, and many others. Among the most extraordinary of these is a small animal, somewhat larger than a squirrel, with a head that has some resemblance to that of a bear. It is called a rattle-mouse, from its frequently making a rattling noise with its tail. This is neither very hairy, nor very long. Its back is of a liver colour, and its sides nearly black. It purs like a cat, and lives for the most part on trees, leaping like a squirrel from one tree to another, feeding upon acorns, nuts, and the like. The feathered tribe are no less numerous; for besides many of those known in Europe, here are ostriches much larger than those we saw in the straits of Magellan, flamingoes, spoon-bills, blue-birds, green-peaks, the long-tongue and many others. The flamingo is larger than a swan, and a very stately bird. Both the head and neck are as white as snow, and the latter is considerably longer than that of a swan. The bill is very broad, and black at the point, and the rest of it of a deep blue. The upper part of the wing-feathers are of a flame colour, and the lower black; but the legs, which are much longer than those of a stork, are of an orange colour, and the feet resemble those of a goose. Though they live upon fish, their flesh is both wholesome, and well tasted. The green-peak is all over green, except two red spots, one on its breast, and another on its head, and is a very beautiful bird. It feeds on insects, which it picks out of the bark of trees. The long-tongue is about the size of a bull-finch, and his tongue is not only very long, but said to be as hard as iron, and the end as sharp as the point of a needle; this being a weapon given it by the author of nature for its preservation. The feathers on the belly are yellow, and the rest speckled. At the Cape are also many sorts of excellent fish, a considerable number of which are common in Europe, and others peculiar to these seas. The reptiles and insects are likewise extremely numerous, and among these are a variety of serpents, scorpions, and some centipedes. Thus to counterbalance the advantage this country affords, from the abundance of useful animals, there are also thrown into the scale many that are prejudicial and extremely dangerous; as if it was intended to shew to man, that amidst the greatest blessings and advantages bestowed on one of the most enchanting spots in the universe, it was necessary to mix a certain proportion of evil, to reduce it more to a level with those countries that are in some respects less desirable.

Both our ship and the Tamar by this time had received a fresh supply of wood, water, and all necessary stores, and being completely fitted for sailing to our native country, on Thursday the 6th of March, our Commodore took leave of the good old governor, and the next day we got under way, and sailed with a fine breeze at S. E. On Sunday the 16th, at six o'clock, A. M. we saw the rocks off the island of St. Helena, bearing W. by N. distant about eight leagues; and at noon, in 8 deg. 16 min. south latitude, we observed a strange sail which hoisted French colours, but in the evening ran her out of sight. We pursued our course without any thing material occurring till the 22th, when we were alarmed by the ship's running foul of a whale or grampus, on which she struck her head, and then her larboard bow. This put the Commodore and officers in no small consternation, lest the Dolphin should have suffered from the violence of the shock, as we were at that time running at the rate of six knots an hour; however we found the shock, though a rude one, attended with no bad consequence. We perceived the sea near the place where the ship struck, tinged

with

with blood, by which we supposed the whale was killed, or at least deeply wounded. On Tuesday the 25th, we crossed the equator, in longitude 17 deg. 10 min. and the next morning Captain Cumming of the *Tamar*, made the signal to bring to, and came on board the *Dolphin* to inform the Commodore, that the rudder braces were broke from the stern-post, whereby the rudder was rendered intirely useles: upon which the Commodore sent his carpenter with assistants on board the *Tamar*, who went to work upon a machine after the model of that which had been fixed to the *Ipſwich*, and *Grafton*, each of which ships, at different times, steered home from *Louisbourg* by the help of such a substitute for a rudder. This machine was completed in about six days, and received some improvements from the ingenuity of the constructor: but it was thought better to send the *Tamar* to *Antigua*, in order to refit; accordingly on the 1st of April, the *Tamar* parted company with the *Dolphin*, steering for the *Caribbee* islands. In their passage they found the difference of sailing with the machine, to be only about five miles in forty-eight hours. After the departure of the *Tamar*, which was the first time of our being separated wholly from her since our leaving England, and in latitude 34 deg. north, longitude 35 deg. west, we had a most violent gale of wind, which drove us to the northward of the western islands, and into latitude 48 deg. north, longitude 14 deg. west. We came within two hundred leagues of the land, and spoke with several ships lately from England, who gave us very erroneous accounts of the bearing of the coast. We had now a strong easterly wind, which lasted several days, and the weather appeared to us piercing cold, from our having been, during so long a time, used to a warm climate. However, we at last had a favourable

wind, and on Thursday, the 7th of May, saw the island of *Scilly*. On the 9th, in the morning, we arrived in the Downs, where we cast anchor; having been nine weeks running from the Cape of Good Hope, and somewhat more than two and twenty months in the circumnavigation of the globe.

Thus ended a voyage, originally planned by his Majesty, George the Third, and which produced the discovery of those islands, that have lately engrossed the attention of the public. We have endeavoured to describe them, and our courses with accuracy, and with truth and authenticity, that might justly be expected from one who saw every thing of which we have given a description. By the assistance of divine providence, and the tenderness of our excellent Commodore, in causing the crews to be served with portable soup, and with the greatest humanity distributing provisions to the sick from his own table, that dreadful disease the scurvy was rendered less inveterate and fatal; and we lost, including those who were drowned, a very inconsiderable number of men, a number so inconsiderable, that it is highly probable, more of them would have died, in the course of a year, had they staid on shore. From our arrival at *Spithead*, till our leaving the ship in the river, no boats were suffered to come on board us, nor any answers to be given to enquirers, with respect to who we were, or from what port we were come, so that a variety of conjectures were formed as to our late voyage. After having waited a few days, each man, according to the promise of the Commodore, received double pay for his services, and had an opportunity of enjoying those comforts, which we, after an absence of twenty-two months from our native country, might be supposed ardently to wish for.

A NEW, ACCURATE, GENUINE, and COMPLETE HISTORY of A VOYAGE Round the WORLD,

PERFORMED

By Captain SAMUEL WALLIS, Esq.

In his MAJESTY's Ship the DOLPHIN;

Having under his Command the SWALLOW SLOOP and PRINCE FREDERIC STORE-SHIP,
of which Mr. CARTERET and Lieutenant BRINE were appointed Masters:

UNDERTAKEN PARTICULARLY

With a view to make Discoveries in the SOUTH SEAS.

Which remarkable circuit of the Globe was begun on FRIDAY, the 22nd of AUGUST 1766, and completed on FRIDAY the 20th of MAY 1768, containing a Period of 637 Days, and included in the Years 1766, 1767, and 1768.

INTRODUCTION.

NEVER was there perhaps collected together in any language, a more copious fund of rational entertainment than will be found in this comprehensive and complete work, of which the present voyage is a part. To trace the progress of the discoveries that have successively been made, in passing round the globe, must fill the reader's mind with such a variety of new information, as cannot fail to raise his wonder, and entertain him with inexpressible delight. In the course of this work he is safely conducted through regions that were

once thought inaccessible, and made acquainted with countries altogether different from that wherein he dwells. Every page he reads will furnish him with novelties, and every voyage will bring him nearer to that unknown country, in search of which so many able commanders have been sent in vain. The discovery of the western continent by Columbus, gave geographers reason to believe, that a like continent existed somewhere in the south. Without such an equipoise they could not conceive how the globe could preserve its balance.

lance. Magellhaens, a Portuguese mariner, was the first who attempted to immortalize his name by the discovery. He passed the straits, that to this day bear his name, and entered the Pacific Ocean, where no European vessel had ever before sailed. He discovered the Ladrone and Philippine isles, and returned by the Cape of Good Hope, having surrounded the whole earth, and proved to demonstration, the spherical figure of the globe. He was followed by navigators of different nations, who, emulous of his glory, sought to pursue the track he had pointed out, with better success; but the dangers they encountered, and the disasters they met with, rendered the difficulties that attended the prosecution insurmountable; many perished, and those who survived were glad to return home after a fruitless search. The ill success which attended these first attempts threw a damp upon the enterprize, and it remained long unnoticed, except in the writings of the learned. Some French geographers, fully persuaded of the reality of such a continent, endeavoured, a few years ago, to revive in their countrymen the spirit of enterprize, with a view to derive honour to their country, by completing the discovery; but the taste for uncommon navigations among the French seemed intirely extinct, and it was not till the Dolphin and Tamar had sailed from England that they thought of renewing it.

At this time, as we have elsewhere observed, our most gracious Sovereign had formed the design of distinguishing himself by patronizing the prosecution of new discoveries in the unknown regions of the southern hemisphere; and surely nothing can more endear a British monarch to his maritime people, than a steady perseverance in this laudable resolution. The love of glory is a passion natural to kings: the conquerors of the world are placed before them as patterns, and they are encouraged by example to seek occasions for war to acquire a name. But how much more glorious is it to enlarge the earth with a new region, than to triumph in the conquest of some rival state!—to extend protection to a remote, and it may be a defenceless people, than to boast of levelling fortresses, and by a general carnage of friends and foes, become master of a few desolated towns, purchased at an expence, a thousand times greater than what is necessary to insure the success of new discoveries. Can there be any comparison between the glory of a successful enterprize, founded on the laudable motives of diffusing happiness through regions, whose inhabitants, for ought we know, are yet immersed in savage darkness; and that of engaging in a hazardous war, by which millions of treasure must be expended, and thousands of lives sacrificed? Is not the chance of succeeding in the first case much more probable than that of conquering in the other? And does not success in the discovery of the long sought region promise much greater advantage to a trading nation, than the conquest of any part of the earth on this side the globe? Did not the little Phœnician state reap more glorious harvest from the discoveries of its merchants, than Alexander could boast from all his conquests? Was it not the perseverance of the Princes Henry, John, and Emanuel, in supporting the expences of prosecuting new discoveries in the fifteenth century, that laid the foundation of the Portuguese greatness, whose territories in Europe are of no inconsiderable extent? But if the glory of aggrandizing a state, and perpetuating a name to posterity, be the first object of human ambition, where shall we look for a monarch, who, after having spread murder and desolation throughout the world, descended to the grave with that heart-felt satisfaction, that attended the Florentine merchant Americus Vesputius, when he saw all Europe agreeing, with one consent, to transfer his name to more than a third part of the terrestrial globe?

The success which has attended his present Majesty's first essays, in the voyages we are now relating, though it has as yet produced no extraordinary advantages to compensate the sums expended in the prosecution of

them, yet it has been such as to open the way to new islands, from whose inhabitants new arts may be learnt, and from whose productions new acquisitions may be made, both to the vegetable and fossil kingdoms, by which the boundaries of science may be enlarged, and the gardens of the curious enriched. Nor does it afford a small satisfaction to inquisitive minds, to be made acquainted with the genius, the arts, the various pursuits, the customs, the manners, the religious notions, the distinctions of rank, and the subordination that is to be met with among the people of various islands and countries, distinct from each other, and from us, in language, habits, learning, and ways of living. Who can read of the poverty and misery of the wretched inhabitants of Terra del Fuego, who have nothing but the skins of beasts thrown over them to defend them from the severity of the cold: natives of a most horrid climate: not better provided with food than with raiment: who can read the story of these forlorn creatures, without lamenting the condition of human beings, destitute as these appear to be, of every comfort and convenience, and exposed every moment to the piercing rigour of the climate, and the still severer cravings of unsatisfied hunger! On the contrary, who can think of these, while, at the same time, he is told of the pleasurable lives of those happy islanders, in the new discovered countries, who abound in flesh, fish, and fruits, even to profusion, without admiring the ways of providence, that, for purposes unknown to us, has so unequally bestowed its dispensations! In these voyages, when we read of men that eat men, not from hunger, but from savage ferocity, we shudder to think of the depravity of our nature, and are convinced of the necessity of bounding our passions by wholesome laws, and of correcting the irregularities of our appetites by the restraints of religion.

The variety of incidents that happened to our navigators, and in the course of their voyages, when historically recited, afford a peculiar kind of entertainment, not to be met with in other productions of a different kind. The many singular adventures, unforeseen dangers, and providential escapes, that every ship experienced in passing round the globe, can only be conceived by those who read, and believed by those who have seen the wonders of the deep. Nothing can excite or gratify curiosity more than relations of marvellous events that happen in succession, and in circumstances equally critical and important. There is not an object that presents itself either by sea or land, but affords some degree of use and speculation. The fish that swim about the ship, and the fowls that present themselves in the ocean, are indications by which the skilful mariner avails himself, either to guard against the storm, or to prepare for land; and our readers, as circumstances arise, either shares his danger, or partakes of his refreshment. We are now preparing for them new subjects of entertainment; and being about to pass again through the straits of Magellan, into the vast Pacific Ocean or South Sea, it may not be amiss to offer a remark on this immense body of water. It extends from the western coasts of North and South America, to the eastern shores of China, Tartary and Japan. From its most western boundary between Peru and Chili, to its most eastern point at Cochin-China, it very near rolls over an extent of 180 degrees of longitude; and it is now supposed, by the most accurate investigation that human skill and spirit will ever make, to reach quite to the South-Pole, and may possibly be as extensive towards the North; so that this sea may be said to embrace, within five degrees, an entire hemisphere of the globe of the world; to explore which, in a certain track, is the object of the voyage, undertaken by Captain Samuel Wallis. The history of this we shall now present to the view of our numerous subscribers, only observing that Captain Wallis in this circumnavigation of the globe, directed his course more westwardly than any former navigator within the tropics.

C H A P. I.

Preparations for this voyage, instructions, &c.—Names of the ships and commanders—Circumstances previous to their sailing from Plymouth—Passage from thence to the coast of Patagonia—Captain Byron's account of the gigantic natives confirmed, with some additional circumstances—The three ships continue their course through the Straits of Magellan—The narrative of the Patagonians concluded—A particular and minute description of the coast on each side the Straits—The places in which the ships anchored during their passage, with an account of the shoals and rocks that lie near them.

A. D. 1766. **W**HEN the present honourable Admiral Byron, then Commodore, returned from his voyage round the world, Captain Samuel Wallis, Esq. was immediately appointed to the command of the Dolphin, in order to make another circuit of the globe, but particularly with a view to discoveries in the Pacific Ocean, having the Swallow, a sloop, mounting 14 guns, appointed to accompany him, the command of which was given to Mr. Carteret, a lieutenant under Commodore Byron, and who on his return was advanced to the rank of a master and commander. His complement was one lieutenant, 22 petty officers, and 90 seamen. The prince Frederic store-ship, was likewise put under Captain Wallis's command, whose master was lieutenant Brine.

On the 19th of June, Captain Wallis, having received his commission, went on board the Dolphin, and the same day hoisted the broad pendant, and began to enter seamen; but agreeable to his orders, he took no boys either for himself or any of his officers. The Dolphin being now fitted for her intended voyage, the articles of war, and the act of parliament were read on board. On the 26th of July, she sailed down the river, and on Saturday the 16th of August, at eight o'clock, A. M. anchored in Plymouth Sound. On Tuesday the 19th, Captain Wallis received his sailing orders, with instructions respecting the Swallow Sloop, and the Prince Frederick store-ship; and this day we took on board 3000 weight of portable soup, and a bale of cork jackets. Every part of the ship was filled with stores of various kinds, even to the steerage and state room; and an extraordinary quantity of medicines being provided by the surgeon, which consisted of three large boxes, and these were put into the Captain's cabin.

On Friday the 22nd, at four o'clock, A. M. the Dolphin, (on board of which was our journalist) departed from Plymouth, in company with the Swallow and Prince Frederick; and too soon, to our mortification, we found the Swallow to be a very heavy sailer.

On Sunday the 7th of September, we had a view of the island of Porto Santo, due west, and near noon came in sight of the east end of the island of Madeira. At five we ran between this and the Deserters, and at six anchored in Madeira Road, about a mile from the shore, in 24 fathoms water, with a muddy bottom. About eight the Swallow and Prince Frederick came also to an anchor. The next morning we saluted the governor with 13 guns, and the compliment was returned with an equal number. We sailed from hence on the 12th, after having taken in beef, wine, and a large quantity of onions, as sea-stores. On the 16th, when off the island of Palma, sailing at the rate of eight miles an hour, the wind suddenly died away, and for two minutes the vessel had no motion, though we were at least four leagues distant from the shore; and we found the ship 15 miles to the southward of her reckoning. Saturday the 20th, we caught eight bonettas, out of a great number which surrounded the ship, and this day we saw two herons flying to the eastward. The Swallow parted from us in the night, between the 21st and 22nd, and on Tuesday the 23rd, at noon, the nearest land of the island of Bonavista bore from S. to W. S. W. and the east-end bore at the same time west, distant two leagues. We now thought it necessary to sound, and had only 15 fathoms, rocky ground; at the same time we perceived a great rippling, occasioned, as we supposed, by a reef; also breakers without us, distant about one league in the direction of S. E. We steered between the rippling and the breakers, and the Prince Frederick passed very near the last, in the S. E. but had no soundings; yet these breakers are thought to be dan-

gerous. On Wednesday the 24th, at six o'clock, A. M. the isle of May bore W. S. W. distant six leagues; and soon after our consort, the Swallow, joined company again. At ten o'clock the west end of the island of May, one of the Cape de Verd Islands, bore north, distant five miles; and at noon the south end of St. Jago bore S. W. by W. distant four leagues. Between these two places we found a current, setting to the southward, at the rate of 20 miles in 24 hours. At near four o'clock, P. M. we cast anchor in Port Praya, in company with the Swallow, and Prince Frederick, in eight fathoms water, upon sandy ground. During the night we had much rain and lightning. On the 25th, we obtained leave from the commanding officer at the fort, to get water and other necessaries. This being the sickly season at this place, and the rains so great as to render it exceeding difficult to get any thing down from the country to the ships; the small-pox being also at this time epidemic; the Captain detained every man on board who had not had that contagious distemper. However, we caught abundance of fish, and procured a supply of water, and some cattle from the island. We also found large quantities of wild purflain, which was very refreshing, either raw as a salad, or boiled in our broth with pease.

On Saturday the 28th, we put to sea, and at about six o'clock, P. M. the peak of Terra del Fuego bore W. N. W. distant 12 leagues. In the night we saw very plainly the burning mountain. This day Captain Wallis ordered every man to be furnished with hook and line, that he might supply himself with fish; and likewise to prevent infection, commanded that no man should keep his fish longer than 24 hours; for the Captain had observed that not only stale, but even dried fish, had tainted the internal air of the ship, and made the people sickly.

On Wednesday the 1st of October, we lost the true trade wind, and had variable gales. We were now in latitude 10 deg. 37 min. north. On the 3rd, we found a current run S. by E. at the rate of six fathoms an hour, and on the 7th, the ship was 19 miles southward of her reckoning. On Monday the 20th, the crews of the three ships were served with oil, all the butter and cheese being consumed; and orders were issued, that, during the remainder of the voyage, they should be served with vinegar and mustard once a fortnight. On the 22nd we judged we were within 60 degrees of land, from the sight of a prodigious number of sea-fowls, among which was a man of war bird. This day we crossed the Equinoctial Line, in longitude 23 deg. 40 min. west from London. On Friday the 24th, orders were given for serving our ship's company with brandy, and the wine was reserved for such as might be sick. On the 27th, the Prince Frederick sprang a leak, and her crew were at this time so sickly, through the fatigue of pumping, and the badness of their provisions, that Lieutenant Brine, her commander, was apprehensive of not being able to keep company much longer, unless some assistance could be given him. The Captain therefore sent a carpenter and six sailors on board, but had it not in his power to supply her with better provisions. As the carpenter found he could do little towards stopping the leak, the Dolphin and Swallow completed their provisions from the store ship, and put on board her empty oil-jars, staves and iron-hoops. On Saturday the 8th of November, we were in latitude 25 deg. 52 min. south, and in 39 deg. 38 min. west longitude from London; and on the 9th, having seen a great number of albatrosses, we sounded with 180 fathoms of line, but had no ground. On the 12th, though the summer season in these climates, yet we found

found the weather so very cold, as to be obliged to have recourse to our thick jackets. On Wednesday the 19th, at eight o'clock, P. M. we saw a meteor of a very extraordinary appearance, in the N. E. which flew off in an horizontal line to the S. W. with amazing rapidity: it was near a minute in its progress, and left behind it a train of light so strong, that the deck was not less illuminated than at noon day. On the 21st, we were by observation in latitude 37 deg. 40 min. south, and in 51 deg. 24 min. west longitude from London. On the 22nd, we saw whales, seals, snipes, plovers, and other birds; with a great number of butterflies. Our soundings continued from 40 to 70 fathoms.

On Monday the 8th of December, at six o'clock, A. M. we descried land, having the appearance of many small islands. At noon in latitude 47 deg. 16 min. south, and in 64 deg. 58 min. west longitude, it bore from W. by S. to S. S. W. distant eight leagues. At eight o'clock, P. M. the Tower Rock, at Port Desire, bore S. W. by W. distant about three leagues. At nine o'clock, P. M. the same island, at noon, in latitude 48 deg. 56 min. south, and in 65 deg. 6 min. west longitude, bore S. by E. distant 19 leagues. We remarked this day, that the sea appeared coloured by the vast quantity of red shrimps that surrounded the ship. The next day, at noon, Wood's Mount, near the entrance of St. Julian's, bore S. W. by W. distant three or four leagues, and our soundings were from 40 to 45 fathoms. On the 11th, we observed in latitude 50 deg. 48 min. south, and in 67 deg. 10 min. west longitude, when Penguin Island bore N. N. E. distant 58 leagues. On Saturday the 13th, in latitude 50 deg. 34 min. south, longitude 68 deg. 15 min. west, we were not more than two leagues distant from the extremities of the land. We found Cape Beachy Head, the northernmost cape, to lie in latitude 50 deg. 16 min. south, and Cape Fairweather, the southernmost cape, in latitude 50 deg. 50 min. south. On the 14th, we were by observation in latitude 50 deg. 52 min. south, and in 68 deg. 10 min. west longitude from London, at which time we were six leagues from the shore, and the extremities of the land were from N. W. to W. S. W. Penguin Island bore north 35 deg. east, distant 68 leagues. On the 15th, at eight o'clock, the entrance of the river St. Croix bore S. W. half W. and the extremities of the land S. by E. to N. by E. At eight o'clock, A. M. we were two leagues from the land. That on the north shore is high, and appears in three capes; but on the south shore it is low and flat. We had 20 fathoms quite across the opening of the river, the distance from point to point being about seven miles; and afterwards keeping at the distance of about four miles from each cape, we had from 22 to 24 fathoms. Cape Fairweather, at seven in the evening, bore S. W. half S. distant four leagues. We stood off and on all night, and had from 30 to 22 fathoms water.

On Tuesday the 16th, at noon, we observed in latitude 51 deg. 52 min. south, and in 68 deg. west longitude. At one o'clock we were about two leagues from the shore. At four, Cape Virgin Mary bore S. E. by S. distant four leagues. At eight in the evening, we were very near the cape, and before nine anchored in a bay close under the south-side of the cape, in 10 fathoms water, bottom gravelly. Soon after the Swallow and Prince Frederick came to an anchor between us and the cape, which bore N. by W. half W. and a low sandy point like Dungeness S. by W. From the cape was a shoal, to the distance of about half a league, which may be easily known by the weeds that are upon it. This day we saw several men riding on the shore, who made signs for us to land. Accordingly the next day, being the 17th, Captain Wallis ordered the signal for the boats belonging to the Swallow and Prince Frederick to come on board, and in the mean time we hoisted out our own. We had observed the natives to remain opposite the Dolphin all night, shouting aloud, and keeping up large fires. Our boats being all manned and armed, and having with us a party of marines, about six o'clock we reached the beach, the Captain

having left orders with the master to bring the ship's side to bear upon the landing place, and to keep the guns loaded with round shot. Captain Wallis with Mr. Cumming and several officers now landed; the marines were then drawn up, and the boats were brought to a grappling near the shore. The Captain having made signs for the Indians to sit down, he distributed among them combs, buttons, knives, scissars, beads, and other toys. The women were particularly pleased by a present of some ribbons. He then intimated that he should be glad to accept some guanicoes and ostriches, in exchange for bill-hooks and hatchets, which were produced, but they were either really or designedly ignorant of his meaning. Captain Wallis measured several of those Indians; among whom the tallest was six feet seven inches; others were one and two inches shorter; but the general height was from five feet ten to six feet. They are muscular and well made, but their hands and feet very small in proportion to the rest of their bodies. They are clothed with the skins of the guanico, sewed together into pieces about six feet long, and five wide: these are wrapped round the body, and fastened by a girdle, with the hairy-side inwards. The guanico is an animal, that in size, make, and colour, resembles a deer; but it has a hump on its back, and no horns. Some of these people wore a square piece of cloth, made of the hair of the guanico, and a hole being cut to admit the head through, it reached down to the knees. They have also a kind of buskin from the middle of the leg to the instep, which is conveyed under the heel, but the rest of the feet is bare. Their hair and coarse hair is tied back with a cotton string; and their complexion is a dark copper. Both the horses and dogs which we saw, were of a Spanish breed. The horses appeared to be about 14 hands high. Both sexes rode astride; but the men were furnished with wooden spurs. Some of these had their arms painted; the faces of some were variously marked; and others had the left eye enclosed by a painted circle of a red colour. The eye-lids of all the young women were painted black. They had each a missile weapon of a singular kind tucked into the girdle. It consisted of two round stones covered with leather, each weighing about a pound, and fastened to the two ends of a string about eight feet long. This is used as a sling, one stone being kept in the hand, and the other whirled round the head, till it is supposed to have acquired sufficient power, and then it is discharged at the object, or any mark they wish to hit. They likewise catch guanicoes and ostriches by means of this cord, which is thrown so, that the weight twists round, and hampers the legs of the intended prey. They are so expert at the management of this double-headed shot, as our Captain called it, that they will hit a mark, not bigger than a shilling, with both the stones, at the distance of 15 yards. The language of these people is quite unintelligible. They were indeed often heard to repeat the word Ca-pi-ta-ne, on which they were successively addressed in Portuguese, Spanish, Dutch, and French; but they had no knowledge of either of those languages. When they shook hands with any of the crew, they always said chevow; and they were amazingly ready at learning English words, and pronouncing the sentence "Englishmen come on shore," with great facility. During our stay on shore we saw them eat some of their flesh meat raw, particularly the paunch of an ostrich, without any other preparation or cleaning than just turning it inside out, and shaking it. We observed among them several beads, such as we gave them, and two pieces of red baize, which we supposed had been left there, or in the neighbouring country, by Commodore Byron. One man among them had a large pair of such spurs as are worn in Spain, brass stirrups, and a Spanish scimeter, without a scabbard; but notwithstanding these distinctions, he did not appear to have any authority over the rest. The women had no spurs. As above 100 of the natives seemed desirous to visit the ship, Captain Wallis took eight of them into the boats. These jumped in with the joy and alacrity of children going to a fair, and having no intention

intention of mischief against us, had not the least suspicion that we intended any mischief against them. In the boat they sung several of their country songs, expressive of their joy; but when they came into the ship, they expressed no kind of surprize, which the multiplicity of objects, to them equally strange and novel, that at once presented themselves, might be supposed to excite. When introduced into the cabin, they looked about with a stupid indifference, till a looking-glass, which drew their attention, afforded them and us much diversion: they advanced, retreated, and played a thousand antic tricks before it, talking with earnestness, and laughing immoderately. For their entertainment, we furnished a table with beef, pork, biscuit, and other articles of the ship's provisions: they eat whatever was set before them, but would drink nothing but water. When they were conducted to see the ship, they looked, with much attention, at the animals we had on board as live stock: they examined the hogs and sheep, and were delighted exceedingly with the Guinea hens and turkeys. One of them making signs that he should be glad of some cloaths, the Captain gave him a pair of shoes and buckles, and presented the rest with a little bag each, in which he put new six-pences and half-pence, with a ribband passed through a hole in them, to hang round their necks: the remaining contents of the bag were, a looking-glass, a comb, some beads, a knife, a pair of scissors, twine, and a few slips of cloth. We offered them some leaves of tobacco, rolled up into what are called segars, and they smoked a few moments, but did not seem to like it. The marines being exercised before them, they seemed terrified at the firing of the musquets; and one of them, falling down, shut his eyes, and lay motionless, as if to intimate, that he knew the destructive nature of those fire-arms, and their fatal effects. The rest seeing our people merry, and finding themselves unhurt, soon resumed their cheerfulness, and heard the second and third volley fired without much emotion; but the old man continued prostrate upon the deck some time, and never recovered his spirits till the firing was over. It was with much difficulty we got rid of these inoffensive visitors. At noon, the tide being out, Captain Wallis gave them to understand by signs, that the ship was proceeding farther, and that they must return on shore: this we soon perceived they were unwilling to do; however, all except the old man, and one more, were got into the boat; but these stopped at the gangway, where the old man turned about, and went aft to the companion ladder: here he stood some time without speaking a word: he now uttered what we supposed to be a prayer; for he many times lifted up his hands and eyes to the heavens, and spoke in a manner and tone very different from what we had observed in the conversation of his countrymen. His oraison seemed to be rather sung than said, and we found it impossible to distinguish one word from another. When the Captain intimated that it was time for him to go into the boat, he looked up at the sun, then moved his hand round to the western horizon, paused, laughed, and pointed to the shore, by which actions, we easily understood, that he petitioned to stay on board till evening: and we took no little pains to convince him, that we could not continue so long upon that part of the coast. At length, however, we prevailed upon him to go over the ship's side with his companion, and as soon as the boat put off, they all began to sing, not ceasing till they reached the shore, where many of their companions pressed eagerly to be taken into the boat, and were highly affronted at being refused. Before our departure we sounded the shoal, that runs out from the point, and found it about three miles broad from N. to S. and to avoid the same it is necessary to keep four miles off the Cape, in 13 fathoms water. The signal was now made for weighing, and at the same time the Swallow received orders to lead, and the Prince Frederick to bring up the rear. The wind being against us, and blowing fresh, we turned into the Strait of Magellan, with the flood tide, between Cape Virgin Mary and the Sandy Point that resembles Dungeness. At the distance of two leagues, west of Dungeness, we

fell in with a shoal, upon which, at half flood, we had but seven fathoms water. Between eight and nine o'clock in the evening, we came to an anchor, one league from the shore, in 20 fathom, with a muddy bottom: Cape Virgin Mary bearing N. E. by E. half E. Point Possession W. half S. distant five leagues. When abreast of the Sandy Point, we saw many people on horseback hunting the guanicoes, which ran up the country with prodigious swiftness. The natives lighted fires opposite the ships, and about 400 of them, with their horses feeding near them, were observed encamped in a fine green valley. The guanicoes were pursued by the hunters, with slings in their hands ready for the cast; but not one of them was taken while they were within the reach of our sight. This being the spot where Commodore Byron saw the Patagonians, on the 18th, a party with some officers were sent towards the shore, but with orders not to land, as the ships were too far off to assist them in case of necessity. When they came near the land, many of the natives flocked to see them, among whom were women and children, and some of the very men we had seen in the morning of the preceding day. These waded towards the boats, frequently calling out, "Englishmen come on shore," and were with difficulty restrained from getting into the boat, when they found our people would not land. Some bread, tobacco, and toys were distributed among them, but not an article of provisions could be obtained in return. We had got under fail about six o'clock, A. M. and at noon there being little wind, and the ebb running with great force, the Swallow, who was a-head, made the signal and came to an anchor; upon which we did the same, and so did the store-ship which was a-stern.

On Friday the 19th, at six o'clock, A. M. we weighed, the Swallow being a-head, and at noon we anchored in Possession Bay, having 12 fathoms water, bottom a clean sand. Point Possession bore east distant three leagues: the Asses Ears west; and the entrance of the Narrows S. W. half W. Upon the point we saw a great number of Indians, and at night, large fires on the shore of Terra del Fuego. From this day to the 22nd, we made but little way, having strong gales and heavy seas. We now anchored in 18 fathoms, muddy bottom. The Asses Ears bore N. W. by W. half W. Point Possession N. E. by E. and the point of the Narrows, on the south-side, S. S. W. distant nearly four leagues. In this situation, we found, by observation, our latitude to be 52 deg. 30 min. south, and our longitude 70 deg. 20 min. west. On the 23rd, we got under way and made sail, but the tide was so strong, that the Swallow was set one way, the Dolphin another, and the Prince Frederick a third. We had a fresh breeze, nevertheless not one of the vessels would answer her helm. However we entered the first narrow; and at six o'clock in the evening, we anchored on the south-shore, the Swallow on the north, and the store-ship not a cable's length from a sand-bank, about two miles to the eastward. The strait here is only a league wide, and, at midnight, the tide being slack, we weighed and towed the ship through. On Wednesday the 24th, we steered from the first narrow to the second, S. W. and, at eight, A. M. we anchored two leagues from the shore, Cape Gregory bearing W. half N. and Sweepstakes Foreland S. W. half W. On Thursday the 25th, we sailed through the second narrow. In our run through this part of the strait we had 12 fathoms within half a mile of the shore. At five o'clock in the evening, the Dolphin suddenly shoaled from 17 to 5 fathoms, St. Bartholomew's Island then bearing S. half W. distant four miles, and Elizabeth's Island, S. S. W. half W. distant six miles. The weather being tempestuous and rainy, at eight o'clock in the evening, we cast anchor under Elizabeth's Island; whereon we found great quantities of wild celery, which being boiled with portable soup and wheat, the crews breakfasted on it every morning for several days. On this island we observed several huts, and places where fires had been recently made, but none of the natives. We also saw two dogs, and fresh shells of muscles and limpets scattered

tered about. The wigwams consisted of young trees, which, being sharpened at one end, and thrust into the ground, in such a manner as to form a circle, the other ends were brought to meet, and fastened together at the top. We saw likewise many high mountains, which, though the midst of summer in this part of the world, had their summits covered with snow; but about three parts of their height they were covered with wood, and above with herbage, except where the snow was not yet melted. On Friday the 26th, at two o'clock, A. M. we weighed; and at five, being midway between Elizabeth's Island, and St. George's, we struck the ground, but the next east had no bottom with 20 fathoms. The Prince Frederick, who was about half a league to the southward of us, had for a considerable time not seven fathoms: the Swallow which was two or three miles to the southward had deep water, for she kept near St. George's Island. We think it is safest to run down from the north-end of Elizabeth's Island, about two or three miles from the shore, and so on all the way to Port Famine. At noon, being three miles from the north-shore, we found by observation our latitude to be 53 deg. 12 min. south, longitude 71 deg. 20 min. west, from London. About four o'clock, we anchored in Port Famine Bay, and with all the boats out, towed in the Swallow and Store-ship. On the 27th, the sick were sent on shore, where a tent was erected for their reception, as was another for the accommodation of the sail-makers, and those who landed to get wood. This day, the weather being squally, we warped the ship farther into the harbour, and moored her with a cable each way in nine fathoms. Cape St. Anne now bore N. E. by E. distant one mile, and Sedger River S. half W. On Sunday the 28th, all the sails were unbent and sent on shore to be repaired; the empty casks were also landed, with the coopers to trim them, and ten men to wash and fill them. We also hauled the seine, and caught plenty of fish resembling mullets, but the flesh was very soft; and among others were smelts, some of which weighed a pound and a half, and were 20 inches long. Indeed all the time of our stay at this place, we caught fish enough to furnish one meal a day both for the sick and the healthy: we gathered also great plenty of celery, and pea-tops, which were boiled with the pease and portable soup: besides these we found fruit that resembles cranberries, and the leaves of a shrub somewhat like our thorn, which were remarkably four. When we arrived here, many of our people had the scurvy to a great degree; but by the plentiful use of vegetables, and bathing in the sea, within a fortnight there was not a scorbutic person in either of the ships. Their recovery also was greatly promoted by the land air, and by being obliged to wash their apparel, and keep their persons clean. All hands were now employed in repairing the ship and making her ready for the sea. To this end the forge was set up on shore; and in the meantime a considerable quantity of wood was cut, and put on board the store-ship; and thousands of young trees were carefully taken up with the mould about them, to be carried to Falkland's Islands, which produce no timber. The Prince Frederick received orders to deliver these to the commanding officer at Port Egmont, and to sail to that place with the first fair wind.

A. D. 1767. On Wednesday the 14th of January, the master of the cutter, which was victualled for a week, was sent to look out for anchoring places on the north-shore of the strait; and this day we got all our people and tents on board, having taken in 75 tons of water, and 12 months of provisions for ourselves, and ten months for the Swallow, from on board the store-ship. On the 17th, the master of our cutter returned with an account, that he had found anchoring places; and this day the Prince Frederick sailed for Falkland's Islands. The master reported, that between where we lay and Cape Forward, he had been on shore at four places, where was good anchorage, and plenty of wood and water close to the beach, with abundance of cranberries and wild celery: that he had also seen a great number of currant bushes full of fruit, and a

No. 31.

variety of beautiful shrubs in full blossom, besides great plenty of winter's bark, a grateful spice, which we have already particularly described. On Sunday the 18th, at five o'clock, A. M. we sailed; and at noon, observed in latitude 54 deg. 3 min. south; here we found the strait to be two leagues wide. On the 19th, we came to an anchor, half a mile from the shore, near Cape Holland, opposite a current of fresh water, that falls rapidly from the mountains. Cape Holland bore W. S. W. half W. distant two miles; Cape Forward east; and by observation our latitude was 53 deg. 38 min. south. As a more convenient anchoring place, and better adapted for procuring wood and water, had been discovered, we made sail on the 22nd, and at nine in the evening, being about two miles distant from the shore, Cape Gallant bore W. half N. distant two leagues; Cape Holland E. by N. six leagues; and Rupert's Island W. S. W. At this place the strait is not more than five miles over.

On Friday the 23rd, we came to an anchor in a bay near Cape Gallant, in 10 fathoms water, a muddy bottom. The boats being sent out to sound found good anchorage every where, except within two cables length S. W. of the ship, where it was coral, and deepened to 16 fathoms. In this situation the east point of Cape Gallant bore S. W. by W. one fourth W. the extreme point of the easternmost land E. by S. a point making the mouth of a river N. by W. and the white patch on Charles's Island S. W. We now examined the bay and a large lagoon. The last was the most commodious harbour we had yet seen, having five fathom at the entrance, and four to five in the middle. It is capable of receiving a great number of vessels, had three large fresh water rivers, and plenty of wood and celery. We had here a seine spoiled, by being entangled with the wood that lies sunk at the mouth of the rivers; but though we caught not much fish, we had wild ducks in such numbers as to afford us a very seasonable relief. Near this place are very high mountains, one of which was climbed by the master of our cutter, with the hope of getting a view of the South Sea; but, being disappointed in his expectation, he erected a pyramid, and having written the ship's name, and the date of the year, he left the same, with a shilling, within the structure. On the 24th, in the morning, we examined Cordes Bay, which we found much inferior to that in which the ships lay, the entrance being rocky, and the ground within it foul. It had, it is true, a more spacious lagoon, but the mouth of it was very narrow, and barred by a shoal, whereon was not sufficient depth of water for a ship of burden to float. Here we saw an animal that resembled an ass; as swift as a deer, and had a cloven hoof. This was the first animal we had seen in this strait, except at the entrance, where we found the guanicoes, and two dogs. The circumjacent country has a dreary and forbidding aspect. The mountains on both sides are of a stupendous height; whose lower parts are covered with trees, above which a space is occupied by weathered shrubs; higher up are fragments of broken rocks and heaps of snow; and the tops are totally rude, naked, and desolate. To see their summits towering above the clouds in vast crags, that are piled upon each other, affords to a spectator the idea, that they are the ruins of nature, devoted to everlasting sterility and desolation. This day we founded about the Royal Islands, but found no bottom; wherever we came to an opening, we found a rapid tide set through; and they cannot be approached by shipping without the most imminent danger. And here, for the information of future navigators, we would observe, that in a run through this part of the strait, they should keep the north-shore close on board all the way, and not venture more than a mile from it till the Royal Islands are passed. Through the whole day the current sets easterly, and the indraught should by all means be avoided.

On Tuesday the 27th, we weighed with all expedition, and departed from Cape Gallant Road, which lies in 53 deg. 50 min. south latitude. At noon on the 28th, the west-point bore W. N. W. half a mile distant.

3 T

tant.

tant. At two o'clock, the west point bore east, distant three leagues, and York Point W. N. W. distant five leagues. At five, we opened York Road, the point bearing N. W. distant half a mile; at which time the Dolphin was taken a-back, and a strong current with a heavy squall drove us so far to leeward, that it was with great difficulty we got into Elizabeth's Bay, and anchored in 12 fathoms water, near a river. The Swallow being at anchor off the point of the bay, and very near the rocks, Captain Wallis ordered out all the boats with anchors and hausers to her assistance, and she was happily warped to windward into good anchorage. At this time York Point bore W. by N. A shoal with weeds upon it, at the distance of a cable's length, W. N. W. Point Passage S. E. half E. distant half a mile; a rock near Rupert's Isle S. half E. and a rivulet on the bay N. E. by E. distant about three cables length. Having this day at sun-set seen a great smoke on the southern shore, and on Prince Rupert's Island, early in the morning of the 29th, the boats were sent on shore for water. Our people had no sooner landed, than several of the natives came off to them in three canoes; and having advanced towards the sailors, made signs of friendship, which being answered to their satisfaction, they hallooed, and our men shouted in return. When the Indians drew near they were eating the flesh of seals raw, and were covered with the skins, which stank intolerably. They had bows, arrows, and javelins, the two last of which were pointed with flint. These people were of a middling stature, the tallest of them not exceeding five feet six inches. Their complexion was of a deep copper colour. Three of them being admitted on board the Dolphin, they devoured whatever food was offered them; but like the Patagonians would only drink water: like them too, they were highly diverted with a looking glass, in which they at first stared with astonishment; but having become a little more familiar with it, they smiled at its effect; and finding a corresponding simile from the image in the glass, they burst into immoderate fits of laughter. The Captain going on shore with them, presented some trinkets to their wives and children, and received in return some of their weapons, and pieces of mundic, of the kind found in the tin mines of Cornwall. The sails of the canoes belonging to these Indians were made of the seal skin. To kindle a fire they strike a pebble against a piece of mundic, holding under it, to catch the sparks, some moss or down, mixed with a whitish earth, which takes fire like tinder: they then take some dry grass, and putting the lighted moss into it, wave it to and fro, and in a minute it blazes. When they left us, they steered for the southern shore, where we saw many of their huts; and we remarked, that not one of them looked behind, either at us or the ship, so little impression had the curiosities they had seen made upon their minds. As this seems to be the most dreary and inhospitable country in the world, not excepting the worst parts of Sweden and Norway, so the natives seem to be the lowest and most deplorable of all human beings. Their perfect indifference to every thing they saw, which marked the disparity between our state and their own, though it may preserve them from the regret and anguish of unsatisfied desires, seems, notwithstanding, to imply a defect in their nature; for those who are satisfied with the gratifications of a brute, can have little pretension to the prerogatives of men. These Indians when they gave to the gentlemen of our ship several pieces of mundic, intimated, that this substance was found in the mountains, and Captain Wallis is of opinion, that not only mines of tin, but more valuable metals are subsisting there.

On Tuesday the 3rd of February, we weighed, and, in a sudden squall, were taken a-back, so that both ships were in the most imminent danger of being driven ashore on a reef of rocks; the wind, however, suddenly shifting, we got off without much damage. At five o'clock, P. M. we anchored in York Road, Cape Quod now bore W. half S. distant six leagues; York Point E. S. E. distant one mile; Bachelor's River N. N. W. three fourths of a mile; the entrance of Jerom's Sound

N. W. by W. and a small island, on the south shore, W. by S. In the evening we saw five Indian canoes come out of Bachelor's River, and go up Jerom's Sound. Having sent out the boats, in the morning of the 4th, we were informed on their return, that there was good anchorage within Jerom's Sound, and all the way thither from the ship's station; as likewise at several places under the islands on the south-shore; but the force and uncertainty of the tides, and the heavy gusts of wind that came off the high lands, rendered these situations unsafe. This day Captain Wallis went up Bachelor's River, and found a bar at the mouth of it, which, at certain times of the tide must be dangerous. We hauled the seine, but the weeds and stumps of trees prevented our catching any fish. When ashore, we saw many wigwams, and several dogs, which animals ran away the moment they were noticed. We gathered muscles, limpets, sea-eggs, celery, and nettles in abundance. We also saw some ostriches, but they were beyond the reach of our pieces. Three miles up the river, on the west-side, between two mountains of a stupendous height, one of which has received the name of Mount Misery, is a cataract, which has a very striking appearance. It is precipitated down an elevation of above 400 yards; half way over a very steep declivity, and the other half is a perpendicular fall: the sound of which is not less awful than the sight. On Saturday the 14th, at ten o'clock, A. M. we weighed, soon after the current set the ship towards Bachelor's River: we put her in stays, and while she was coming about, which she was some time in doing, we drove over a shoal, where we had little more than 16 feet water, with rocky ground. Our danger was great, for the Dolphin drew 16 feet nine inches aft, and 15 feet one inch forward; but when the ship gathered way, we fortunately deepened into three fathoms; and in a very short time, we got into deep water. We continued plying to windward till four o'clock, P. M. when perceiving we had lost ground, we returned to our last station, and again came to an anchor in York Road.

On Tuesday the 17th, at five o'clock, A. M. we set sail, but notwithstanding we had a fine breeze at well, the ship was carried by a current with great violence, towards the south shore: the boats were all towing a-head, the sails unfilled, yet we drove so close to the rocks, that we were seldom farther than a ship's length from them, and the oars of the boats were frequently entangled in the weeds. In this manner we were hurried along for near an hour, in momentary expectation of being dashed to pieces. All our efforts being ineffectual, we resigned ourselves to our fate, and waited the event in a state of suspense very little short of despair, but Providence interposed for our preservation; for at length we opened St. David's Sound, when, contrary to our expectations, a current rushed out of it, and set us into mid-channel. The Swallow knew nothing of our unhappy situation, being all the time on the north shore. We now sent our boats in search of an anchoring place, and our people returned with the agreeable intelligence, that they had found a convenient one in a small Bay, to which the Captain gave the name of Butler's Bay, it having been discovered by Mr. Butler, one of our mates. We ran in with the tide which set fast to the westward, and anchored in 16 fathoms water; but the Swallow cast anchor in Island Bay, at about six miles distance. Butler's Bay lies to the west of Rider's, on the south-shore of the strait, which is here about two miles wide. The extremities of the bay from W. by N. to N. half W. are about one fourth of a mile asunder. A small rivulet bore S. half W. and Cape Quod north, at the distance of four miles. We kept this station till Friday the 20th, when we encountered a most violent storm, attended with hail and rain, which increased till the evening, the sea breaking over the fore-castle upon the quarter-deck. We made use of every expedient in our power to keep the ship steady, and as the cables did not part, we were again wonderfully preserved, which, considering the narrowness of the strait, and the smallness of the bay in which we were stationed, might in the judgment

judgment of human wisdom be thought impossible: for had the cables parted, we could not have run out with a sail, and not having room to bring the ship up with any other anchor, we must without divine aid have been dashed to pieces in a few minutes; and under such circumstances it is highly probable, that every soul would immediately have perished. By eight o'clock in the evening the gale became more moderate, and gradually decreased during the night. On the 21st, we had the satisfaction to find that our cable was found, but our haulers were much rubbed by the rocks. As to the Swallow, the storm had little affected her; but two days before she had very near been lost by the rapidity of the tide, in pushing through the islands. An alteration had been made in her rudder, nevertheless she steered and worked so ill, that it was apprehended she could not safely be brought to an anchor again. Her commander was of opinion, that she could be of very little service to the expedition, and therefore requested of Captain Wallis to direct what he thought best for the service. The captain returned for answer, "That as the Lords of the Admiralty had appointed her to accompany the Dolphin, she must continue to do it as long as it was possible; that as her condition rendered her a bad sailer, he would wait her time, and attend her motions; and that if any disaster should happen to either of us, the other should be ready to afford such assistance as might be in her power." In this bay we remained eight days, taking in wood and water, and repairing the little damage we had sustained in the late storm. We caught fish of various kinds, among which were muscels near six inches long; also a fine firm red fish, not unlike a gurnet, most of which were from four to five pounds weight. The mountains in this neighbourhood have a most rugged and desolate appearance; but their height could not be ascertained, their heads being lost in the clouds; and some of them, on the southern shore, were so naked, as not to have upon them a single blade of grass. Our master having been sent out in search of anchorage, landed upon a large island on the north-side of Snow Sound, and being almost perished with cold, the first thing he did was to make a large fire with some trees which he found upon the spot. He then climbed one of the rocky mountains, with Mr. Pickersgill a midshipman, and one of the seamen, in order to take a view of the strait, and the distal regions that surround it. He observed the entrance of the sound to be full as broad as several parts of the strait, and to grow but very little narrower on Terra del Fuego side. The country on the south, he said, was more dreary and horrid than any he had yet seen: the mountains hid their heads in the clouds; while the valleys were equally barren, being intirely covered with snow, except where it had been washed away, or converted into ice; and even these bald patches were as destitute of verdure as the rocks between which they lay.

Sunday the 1st of March, at four o'clock, A. M. our companion, the Swallow, was seen under sail, on the north shore of Cape Quod. At seven we set sail, and stood out of Butler's Bay; and at noon sent the boats to seek for anchorage on the north shore. Cape Notch now bore W. by N. half N. distant four leagues, and Cape Quod E. half N. distant three leagues. At three o'clock, P. M. we anchored in a small bay, which we named Lion's Cove, on account of a steep rocky mountain, the top whereof resembles the head of a lion. On the 2nd, we made sail again, and at five in the evening came to anchor in Good Luck Bay, in 28 fathoms water. A rocky island, at the western extremity of the bay, bore N. W. by W. about a cable's length and a half from the Dolphin; and a low point which forms the eastern extremity of the bay, bore E. S. E. distant one mile. In the interval between this point and the ship are many shoals; and two rocks at the bottom of the bay, the largest of which bore N. E. by N. the smallest N. by E. From these rocks, shoals run out to the S. E. which may be known by the weeds that are upon them. Cape Notch bore from us W. by S. half W. distant one league. In the interme-

diate space is a large lagoon, but, the wind blowing hard all the time of our laying here, we could not sound it. Having moored, we sent two boats to assist the Swallow, by which she was towed into a small bay, where, as the wind was southerly, and blew fresh, she was in great danger, for the cove was exposed to S. E. winds, and was also full of rocks. On the four following days we encountered such terrible weather, that we had no other prospect before us than that of immediate destruction: and our seamen were so prepossessed with the notion, that the Swallow could not ride out the storm, that they even imagined they saw some of her hands coming over the rocks towards them. The storm at length subsided, and the gale became more moderate on Saturday the 7th; we therefore at four o'clock, A. M. sent a boat to enquire after the Swallow, who in the afternoon returned with the welcome news that the ship was safe; but the fatigue of the people had been incredible, the whole crew having been upon the deck near three days and three nights. The gusts returned at midnight, though not with equal violence, but attended with hail, fleet, and snow. On the 8th, Captain Wallis ordered up, the weather being extremely cold, and the crews never dry, 11 bales of the thick woollen stuff, called fear-nought, and employed all the taylors to make them into jackets, of which every man in the Dolphin had one. Seven bales of the same cloth were also sent on board the Swallow, which made every man on board a jacket of the same kind. Three bales of finer cloth were cut up for the officers of both ships, which were very acceptable. On Sunday the 15th, seeing the Swallow under sail, we sent off our launch, whereby she was towed into a very good harbour on the south shore, opposite to where we lay. The favourable account we received of this harbour determined us to depart from Good Luck Bay, and we thought ourselves happy when we got safe out of it. When abreast of the place where the Swallow lay at anchor, we fired several guns, as signals for her boats to assist us, and in a short time the master came on board, and piloted us to a very commodious station, where we cast anchor in 28 fathoms, bottom muddy. This bay, which we called Swallow Harbour, is sheltered from all winds, and excellent in every respect. There are two narrow channels into it, but neither of them dangerous.

On Monday the 16th, at nine o'clock, A. M. we weighed, and took the Swallow in tow. At five, P. M. being little wind, we cast her off. At nine we had fresh gales, and at midnight Cape Upright bore S. S. W. half W. On the 17th, by the advice of Captain Carteret, we bore away for Upright Bay, and, he being acquainted with the place, the Swallow was ordered to lead. At eleven o'clock we opened a large lagoon, and by means of a current, which set strongly into it, the Swallow was driven among the breakers close upon the lee-shore: she made signals of distress, and notwithstanding the weather was hazy, and the surf ran high, our boats took her in tow, but their utmost efforts to save her would have been in vain, had not a breeze from the shore happily relieved her. At noon a great swell came on, the waves ran high, and the fog was so thick, that we narrowly escaped shipwreck, in what we conjectured to be, the Bay of Islands; we therefore endeavoured to haul out, as the only chance of escaping; this we found no easy task, being obliged to tack continually, to weather some island or rock; but at four o'clock, P. M. the weather clearing up a little, we had a sight of Cape Upright, for which we immediately steered, and between five and six came safely to an anchor in the bay, in 46 fathoms, with a muddy bottom. A high bluff land on the north-shore bore N. W. half N. distant five leagues, and a small island within us S. by E. half E. The Swallow, who was driven to lee-ward, notwithstanding she had two anchors a-head, was brought up about a cable's length astern of us, in 70 fathoms water. To clear her anchors, for which purpose we sent a considerable number of our hands, and to warp her into a proper birth, cost us the whole day, and was not only a work of time, but of the utmost difficulty and labour. On the 18th, we sent out boats

boats to sound quite cross the strait, and this day we moored the ship in 78 fathoms, with the stream anchor. On the 19th, two canoes, having in them several Indians, came along-side the Dolphin. They were equally miserable and abject, with those we had before seen. A seaman gave one of them a fish, which he had just caught with a line, and it was then alive. The Indian seized it as a dog would a bone, and instantly killed it by biting it near the gills; he then began at the head, and proceeded on to the tail, champing up the bones, and devouring both the scales and the entrails. These people would drink no other liquor than water, but they eagerly tore in pieces and swallowed down provisions of any kind, whether boiled, roasted, raw, salt, or fresh. Though the weather was very cold, their only covering was a seal-skin, and even that they put off when rowing. We observed that they all had fore eyes, occasioned probably by the smoke of their fires, and their filthy way of feeding and living made them smell as rank as a fox. They had with them some javelins, rudely pointed with bone, with which they used to strike seals, fish, and penguins. Their canoes were about 15 feet in length, three broad, and nearly the same measurement in depth. They were constructed with the bark of trees tacked together, either with the sinews of some beast, or thongs cut out of a hide. A kind of rush was laid into the seams, and the out-side was smeared with resin or gum, which prevented the water from soaking into the bark. To the bottom and sides were sewed transversely 15 slender branches, bent into an arch; and some strait pieces were placed cross the top, from gunwale to gunwale, securely lashed at each end; but upon the whole the workmanship was very rough, nor had these people any thing among them, wherein there was the least appearance of ingenuity. The Captain presented them a hatchet or two, some beads, and a few other baubles, with which they departed, seemingly well satisfied, to the southward. During our stay here, we sent our boats as usual in search of anchoring places. Several small coves were discovered, but most of them dangerous. Twenty-two of the sailors belonging to one of the boats, staying one night on an island, about 30 Indians landed, ran immediately to the boat, and began to make off with every thing they could carry away; the sailors discovered what they were doing, and had but just time to prevent their depredations. When opposed, they went to their canoes, and armed themselves with long poles and pointed javelins. They stood in a threatening attitude, and our people on the defensive; but the latter parting with a few trifles to them, they became friends, and peace and harmony were again restored. From this time to the 30th, we had hard gales, and heavy seas, accompanied with hail, lightning, and rain. Nevertheless, the men were sent frequently ashore for exercise, which contributed not a little to their health, and by them we had almost a constant supply of muscles and vegetables. On Monday the 30th, we improved the first interval of moderate weather, in drying the sails, and airing the spare ones, which last we found much injured by the rats. We also repaired the fire-place of the Swallow in the same manner as we had done our own, and set up a back with lime made of burnt shells. This day we saw several canoes full of Indians, on the east-side of the bay, and the next morning several came on board, and proved to be the same people which the boats crew had seen on shore.

On the 1st of April, several other Indians came off to the ship, and brought with them several of the birds called race-horses, which some of our company purchased for a few trifles. They behaved very peaceably, and the Captain presented them with several hatchets, and dismissed them with a few toys as usual. On the 2nd, eight Indians brought six of their children on board, whom the Captain gratified with bracelets and necklaces. These people were exceedingly tender in the treatment of their children; and a circumstance happened which proves that they are not less delicate in other respects. A boat was ordered on shore to get wood and water; at which time some of the Indians

were on board, and others in their canoes along-side the ship: the latter eyed the boat attentively; and, on her putting off, called aloud to their companions, who, without speaking, instantly handed down the children, and jumped into the canoes, which hurried after the boat, while the poor Indians cried in a most distressful tone. When our boat was near land, some women were seen among the rocks, to whom the Indians called aloud, and they all ran away; but the boats crew having remarked their jealous fears, lay on their oars, to convince them that no injury was intended. The Indians landed, drew their canoes on shore, and hastily followed the objects of their affections. This day the master of the Swallow, who had been sent out to seek for anchoring places, returned with an account, that he had found three on the north shore, most of which were very good; one about four miles to the eastward of Cape Providence, another under the east-side of Cape Tamar, and a third about four miles to the eastward of it; but it must be observed, that the ground under Cape Providence is rocky. Our men at this time began to be troubled with fluxes, on which account, at the request of our surgeon, it was ordered, that no more muscles (which had been found continually in abundance) should be brought on board. On Friday the 10th, we made sail in company with the Swallow. At noon, Cape Providence bore N. N. W. distant five miles. At four P. M. Cape Tamar bore N. W. by W. half W. distant three leagues, and Cape Pillar W. distant ten leagues. Cape Upright bore E. S. E. half S. distant three leagues. On the 11th, having steered W. half N. all night, we found, at six o'clock, A. M. that we had run 38 miles by the log. At this time, Cape Pillar bearing S. W. distant half a mile, the Swallow was about three miles astern of us, and being but little wind, we were obliged to crowd all the sail we could, to get without the straits mouth. The Captain, at eleven o'clock, would have shortened sail for our comfort, but it was not in our power, for it was absolutely necessary for us to carry sail, in order to clear the isles of direction. Soon after we lost sight of the Swallow, and saw her not again during the remainder of our voyage. At noon our latitude by observation was 52 deg. 38 min. and our longitude by computation 76 deg. west from London. The islands of Direction now bore north 21 west, distant three leagues. St. Paul's Cupola, and Cape Victory in one, north, distant seven leagues, and Cape Pillar east, distant six leagues. Happy did we now think ourselves in having cleared the Straits of Magellan, a dreary and inhospitable region, in which we had contended with innumerable difficulties, and escaped most imminent dangers, in a passage of almost four months, namely, from December the 17th, 1766, to the 11th of April, 1767.

Our Journalist now proceeds to a description of the places in which the ships anchored, during their passage through the straits, from whence we have extracted such particulars, as may be of use to future navigators, furnish real improvement to those of our subscribers who belong to his majesty's navy, and afford an agreeable entertainment to our various and numerous classes of readers.

(1.) Cape Virgin Mary. This is a steep white cliff, which somewhat resembles the South Foreland. By observation and our reckoning, it lies in latitude 52 deg. 24 min. south, and in 68 deg. 22 min. west longitude from London. Under this cape, when the wind is westerly, is a good harbour, but we saw no appearance either of wood or water. About a mile from the shore, you may anchor in ten fathom water, with coarse sandy ground. (2.) Possession Bay. The point of this lies in latitude 52 deg. 23 min. south, and in 68 deg. 57 min. west longitude. Here the foundings are very irregular, but the ground is throughout a fine soft mud and clay. The landing appeared to be good, but we could see no signs of either wood or water. It is necessary, in sailing into this bay, to give the point a good birth, there being a reef that runs about a mile right off it. (3.) Port Famine. This is an excellent bay, capacious enough for many ships to moor therein with the utmost safety. Wood and water are to be procured with ease; geel,

geese, ducks, teal, &c. are in great plenty, and fish in abundance. It is situated in latitude 53 deg. 42 min. south, and 71 deg. 28 min. west longitude. We moored in nine fathom, having brought Cape St. Anne N. E. by E. and the beautiful river Sedger, (of which we have given a particular description in the history of Commodore Byron's voyage,) S. half W. which perhaps is the most eligible situation, though the whole bay is good ground. In the year 1581, the Spaniards built a town here, which they named Philipville, and left in it a colony of 400 persons. Seventy-six of this number were starved, and of the remainder, 23 proceeded in search of the river Plata, and most probably perished, as no tidings were ever heard of them. When our celebrated navigator Sir William Cavendish arrived at this place in 1587, he found the only one that remained of those unfortunate adventurers, named Hernando, and brought him to England. From their melancholy fate, Sir William named the bay, Port Famine. (4.) Cape Holland Bay. This lies in latitude 53 deg. 57 min. and in 72 deg. 34 min. west longitude. Here is a fine rivulet, and close under the cape a large river, navigable for boats many miles; and the shore affords plenty of fire-wood. We caught very little fish, but found plenty of muscles and limpets. The adjacent country produces plenty of cranberries and wild celery. We killed some geese, ducks, teal, and race-horses, yet the birds are not numerous. There is no danger in sailing into this bay, and in every part thereof is good anchoring ground. (5.) Cape Gallant Bay. This is situated in 53 deg. 50 min. south latitude, and 73 deg. 9 min. west longitude. The landing is good; the tide very irregular; and the best anchoring is on the east-side, where we found from 6 to 10 fathoms. Here are abundance of wood, vegetables, and fish, with good watering from two rivers. In this bay, which may be entered with great safety, there is a spacious lagoon, where a fleet of ships may moor in perfect security. The lagoon abounds with wild fowl, and we found in, and about it, wild celery, muscles, and limpets in plenty. (6.) Elizabeth Bay. Its latitude is 53 deg. 43 min. south, and its longitude 73 deg. 24 min. west. Sufficient quantities of wood may be procured here for the use of ships, and they will find good watering at a small river. We gathered a little celery and a few cranberries, but met with neither fish nor fowl. The best anchorage is at Passage Point, at half a mile distance, bearing S. E. and the river N. E. by E. distant three cables length; in this station, a shoal, which may be known by the weeds, bears W. N. W. distant one cable's length: the ground is coarse sand and shells. At the entrance of this bay are two small reefs, that appear above water. The most dangerous of the two is at the east point of the bay, but this may easily be avoided, by keeping at the distance of about two cables length from the road. (7.) York Road. This lies in latitude 53 deg. 39 min. south, and, by our account, 73 deg. 52 min. west longitude. The landing in all parts of this place is very good; and we found celery, cranberries, muscles, limpets, wild fowl, and some fish, but not sufficient to supply our ships company with a single meal. About a mile up Bachelor's River is good watering, and plenty of wood all round the bay. From the Western Point a reef runs off about a cable's length, which, when known, may easily be avoided. To anchor with safety in this bay, bring York Point E. S. E. Bachelor's River

N. by W. half W. The reef N. W. half W. and St. Jerom's Sound W. N. W. at the distance of half a mile from the shore. The current here frequently sets in three different directions; the water rises and falls about eight feet; but the tide is irregular. (8.) Butler's Bay. This is situated in latitude 53 deg. 37 min. south, and in 74 deg. 9 min. west longitude. It is not only small, but entirely encircled with rocks, on which account we would caution every navigator against anchoring at this place, if he can possibly avoid it. Here are some rock fish, and a few wild fowl, but celery and cranberries are very scarce. (9.) Lion's Cove. The same may be said of this as we have observed of the preceding bay; but though the water up a small creek is good, here is no wood. The latitude is 53 deg. 26 min. south; longitude, by our account, 74 deg. 25 min. west. (10.) Good Luck Bay. This is situated in latitude 53 deg. 23 min. and in 74 deg. 33 min. west longitude. Like several others, it is small, and the rocks with which it is surrounded, render it very difficult of access. We procured here a sufficient quantity of fresh water, but very little wood. Not any kinds of refreshments are to be expected at this place; indeed we caught only a few rock fish with hook and line. The ground is very coarse, and the cable of our best bower anchor was so much rubbed, that we were obliged to condemn it, and bend a new one. Circumstances may arise under which it may be thought good luck to get into this bay, but we thought it very good luck when we got out of it. (11.) Swallow Bay. This lies in latitude 53 deg. 29 min. south, and in 74 deg. 35 min. west longitude. The entrance is narrow and rocky, but when once entered, it is very safe, being sheltered from all winds. The rocks, by keeping a good lookout, may be easily avoided. As to the mountains that surround it they have a most horrid appearance, and seem to be deserted by every thing that has life; and we found no supply of provisions, except a few rock fish and muscles. The landing is very good, and the tide rises and falls between four and five feet. (12.) Upright Bay. This is in latitude 53 deg. 8 min. south, longitude 75 deg. 35 min. west. The entrance is very safe, and the water excellent. A sufficiency of wood may be procured for stock, but provisions are rather scarce. The landing is not good, the tide very irregular; and the water rises and falls above five feet. Besides these 12 bays, there are three others, a little beyond Cape Shut-up, which we named River Bay, Lodging Bay, and Wallis's Bay, the last of which is the best. Also between Elizabeth Bay and York Road lies Muscle Bay, wherein is exceeding good anchorage with a westerly wind. The ground of Chance Bay is very rocky, and therefore to be avoided. Not far from Cape Quod, to the eastward, lies Island Bay, which is by no means an eligible situation for shipping. There is likewise a bay with good anchorage, opposite to York Road; and another to the eastward of Cape Cross-tide, but this latter one will hold only a single ship. Between Cape Cross and St. David's Head lies St. David's Sound, on the south-side of which we found a bank of coarse sand and shells, with a depth of water from 19 to 30 fathom, where a ship might anchor in case of necessity; and the master of the Swallow found a very good small bay a little to the eastward of St. David's Head.

C H A P. II.

The Dolphin proceeds on her voyage from the strait to the westward—Several islands discovered in the South Sea, namely—Whitsun Island—Queen Charlotte's—Egmont—Gloucester—Cumberland—Prince William Henry's—Osnaburgh—King George the Third's, called by the natives Otahite, with a particular, full, and complete description of those islands—The customs, manners, &c. of the natives—The several incidents which happened on board the ship and ashore—Particularly, a very circumstantial account of the inhabitants of Otahite—Their arts, trade, domestic life, and character.

An expedition to discover the inland part of the country—And a variety of incidents and transactions, till we quitted the island to continue our voyage.

ON Sunday the 12th of April 1767, after having cleared the strait, we held on our course to the westward. Here it may be proper to observe, that, as all the hard gales by which we suffered, blew from the westward, we think it advisable to stand about 100 leagues and more to the westward, after sailing out of the Strait of Magellan, that the ship may not be endangered on a lee-shore, which at present is wholly unknown. As we continued our course a number of sheerwaters, pintadoes, gannets, and other birds, flew about the ship; the upper works of which being open, and the cloaths and bedding continually wet, the sailors in a few days were attacked with fevers; and having a continuation of strong gales, hazy weather, and heavy seas, we were frequently brought under our courses. On Wednesday the 22nd, we observed in latitude 42 deg. 24 min. south, and in 95 deg. 46 min. west longitude; and on Monday the 27th at noon, we found our latitude to be 36 deg. 54 min. south, and our longitude, by account, 100 deg. west from London. This day being fair, and the weather moderate, the sick were brought on deck, to whom were given salop, and portable soup, in which wheat had been boiled. The violent gales returned, so that the beds were again wet through, and it was feared that the ships would lose her masts; we therefore began to think of altering our course, in hope of better weather; and the rather, as the number of our sick encreased so fast, that there was danger of soon wanting hands to navigate the vessel. On Monday the 4th of May, by observation, we found ourselves in latitude 28 deg. 20 min. south; and in 96 deg. 21 min. west longitude. On the 8th, we saw several sheerwaters and sea-swallows; and on Tuesday the 12th, we observed the same kind of birds, and some porpoises about the ship. On the 14th, we saw the appearance of what we imagined to be high land, towards which a flock of brown birds were observed to fly; we therefore steered all night for this supposed land; but at day-break could see no signs of it. As the weather now became moderate, we found our people recovered very fast; and the carpenters were busied in caulking the upper works of the ship, and repairing the boats. On the 15th, our latitude was 24 deg. 50 min. south, and our longitude 106 deg. west. On Monday the 18th, a sheep, by the captain's order, was distributed among our people who were sick and recovering. On Thursday the 21st, we saw a number of flying fish; and on the 22nd some bonettas, dolphins, and flying-fish. About this time, such of the seamen on board as had been recovering from colds and fevers, began to be attacked by the scurvy, upon which, at the surgeon's representation, wine was served to them; wort was also made from malt for their use; and each of the crew had half a pint of pickled cabbage every day, notwithstanding which the men began to look very sickly, and to fall a prey to the scurvy very fast; to repel which they had wine served instead of spirits, with plenty of sweet-wort and salop: portable soup was boiled in their peas and oatmeal; their births and cloaths were kept constantly clean; the hammocks were every day brought upon deck at eight o'clock in the morning, and carried down at four in the afternoon; some or other of the beds and hammocks were washed daily: the ship's water was rendered wholesome by ventilation, and every part between decks was cleansed with vinegar. This day our latitude was 20 deg. 18 min. south, and 111 deg. west longitude. On Tuesday the 26th, we saw two grampuses; and on the 27th, a variety of birds, one of which was taken for a land-bird, and resembled a swallow. On the 31st, we found by observation our latitude to be 29 deg. 38 min. south, longitude 127 deg. 45 min. west.

On Monday the 1st of June, we saw several men of war-birds, and, on the 3rd some gannets; and, the weather being at this time very various, we conceived hopes that we drew near to land. On the 4th, a turtle swam close

by the ship, and the next day a great variety of birds were seen. On Saturday the 6th, the long wished-for land became visible from the mast-head, the man crying out "Land in the north-west." This in the course of the day proved to be a low island, distant about six leagues. When within five miles of this island, we discovered a second to the W. N. W. The first lieutenant being at this time very ill, Mr. Furneaux, the second lieutenant, was sent with two boats to the first island, the crews of each being well provided with arms. When the boats came near the island, two canoes were observed to put off to the adjacent one; and no inhabitants were seen to remain where our party landed. Here several cocoa-nuts, and a large quantity of scurvy-grafs were obtained, which proved a valuable acquisition to the sick, and a grateful refreshment to those in health. They returned in the evening to the ship, bringing with them some fish-hooks, which the islanders had formed of oyster-shells. In this excursion they discovered three huts, supported on posts, and open all round, but thatched with cocoa-nut and palm leaves. As no anchorage could be found, and the whole island was encompassed with rocks and breakers, Captain Wallis resolved to steer for the other island, giving the name of Whitsun Island to this, because it was discovered on Whitsunday's Eve. Having approached the other island, Mr. Furneaux was again sent off with the boats, manned and armed. At this time about 50 of the natives were seen running about with fire-brands in their hands. Mr. Furneaux was instructed to steer to that part of the shore, where the natives had been seen, to avoid giving offence. When Mr. Furneaux drew near with the boats to the shore, the natives put themselves in a posture of defence, with their pikes; but the lieutenant making signs of amity, and exposing to view a few trinkets, some of the Indians walked into the water: to whom it was hinted, that some cocoa-nuts and water would be acceptable; which was no sooner understood, than they ventured with a small quantity of each to the boats; and received nails and other trifles in exchange. While bartering with them, one of the Indians stole a silk handkerchief with its contents, but the thief could by no means be discovered.

On Monday the 8th, Mr. Furneaux was again dispatched with the boats, and received orders from Captain Wallis to land, if he could do it without offending the natives. As this party drew near to the shore, they observed seven large canoes, each with two masts, lying ready for the Indians to embark in them. These having made signs to the crew to proceed higher up, they complied, and immediately the Indians embarked on board the seven large canoes and quitted the spot, being joined by two canoes at another part of the island. These latter the Indians steered in a direction of W. S. W. They were divided, two being brought along-side of each other, and fastened together, at the distance of about three feet asunder, by cross beams, passing from the larboard gunwale of one to the starboard gunwale of the other, in the middle and near each end. They appeared to be 30 feet in length, four in breadth, and three in depth. The people had long black hair hanging over their shoulders, of a dark complexion, of a middle size, and were dressed in a kind of matting made fast round the middle. The women are beautiful, and the men justly proportioned. In the afternoon the second lieutenant being again sent on shore, the Captain commanded him to take possession of the island in the king's name, and to call it Queen Charlotte's Island. The boats returned loaded with cocoa-nuts and scurvy-grafs, after having found two wells of excellent water. Provisions for a week were now allotted for a mate and 20 men, who were left on shore to fill water; the sick were landed for the benefit of the air; and a number of hands were appointed to climb the cocoa-trees and gather the nuts, which in our situa-

tion were very desirable. The water was brought on board on the 10th, but the cocoa-nuts and vegetables, which the cutter was bringing off, were lost by the rolling of the waves, that almost filled her with water. Afterwards they made an island where were found several tools, resembling adzes, awls, and chisels, which were formed of shells and stones. The dead bodies were not buried, but left under a kind of canopy, to decay above ground. This day the ship sailed again, after taking possession of the islands for the king; in testimony of which we left a flag flying, and carved his majesty's name on a piece of wood, and on the bark of several trees. We left shillings, sixpences, halfpence, bottles, nails, hatchets, and other things for the use of the natives. It was remarkable, that on this island we found the very people who had fled from Queen Charlotte's Island, with several others, in the whole near 100. It lies in 19 deg. 20 min. south latitude, and 138 deg. 30 min. west longitude, and received the name of Egmont Island. On Thursday the 11th, we observed about 16 persons on an island which was called Gloucester Island; but as it was surrounded with rocks and breakers, we did not attempt to land. This day we likewise discovered another, which was called Cumberland Island; and, on the day following, a third, which received the name of Prince William Henry's Island.

On Wednesday the 17th, we again discovered land, and at ten at night saw a light, which convinced us that it was inhabited, and remarked, that there were plenty of cocoa-trees, a certain proof of there being no want of water. Mr. Furneaux was sent on shore the day following, with instructions to exchange some toys for such things as the island produced. He saw a great number of the people, but could find no place where the ship might anchor. Some of the natives, who had white sticks in their hands, appeared to have an authority over the rest. While the lieutenant was trafficking with them, an Indian diving into the water, seized the grappling of the boat, while his companions on shore laid hold of the rope by which she was fastened, and attempted to draw her into the surf, but their endeavours were frustrated by the firing of a musquet, on which they all let go their hold. These Indians were dressed in a kind of cloth, a piece of which was brought to the ship. It was concluded from the number of the people seen, and their having some large double canoes on the shore, that there were larger islands at no great distance: the Captain, therefore, having named this place Osnaburgh Island, made sail and soon discovering high-land, came to an anchor, because the weather was very foggy. The next morning early we saw land, distant four or five leagues; but, after having sailed towards it some time, thought it prudent again to anchor, on account of the thickness of the fog; but it no sooner cleared away, than we found the ship encompassed by a number of canoes, in which were many hundreds of people. Having approached the ship, they beheld it with wonder, and talked with great earnestness. Some baubles were now shewn them, and signs were made for them to come on board, on which they rowed the canoes towards each other, and a general consultation took place; at the conclusion of which they all surrounded the ship with an appearance of friendship, and one of them delivered an oration, at the conclusion of which he threw into the sea the branch of a plantain-tree, which he had held in his hand. This being done, a young Indian, of more apparent courage than the rest, ventured on board the ship. The Captain would have given him some baubles, but he refused the acceptance of them till those in the canoes came along-side, and, having held a consultation, threw on board several branches of the plantain-tree. Others now ventured on board; but it was remarked, that they all got into the ship at some improper part, not one of them, even by accident, finding the right place of ascent. A goat belonging to the ship, having run his horns against the back of one of the Indians, he looked round with surprise, and seeing the animal ready to renew the attack he sprang over the ship's side, and was instantly followed

by all his countrymen. Their terror, however, soon subsided, and they returned to the ship; and the sheep, hogs, and poultry being shewn them, they intimated that they possessed the two latter species. The Captain then gave them nails and other trifles, and made signs that he wanted hogs, fowls, and fruit; but they could not comprehend him. They were detected in several attempts to take away any thing they could lay hold of; but one of them at length jumped overboard with a laced hat which he had snatched from one of the officers.

The interior parts of the island abounds in hills, clothed with timber-trees, above them are high peaks, from which large rivers descend to the sea; the houses, when seen at a distance, resemble barns, having no shelter but a roof; the land towards the sea is level, and produces the cocoa-nut, with a variety of other fruits, and the face of the whole country is picturesque beyond description. We now sailed along the shore, while the canoes, which could not keep pace with us, made towards the land. In the afternoon the ship brought to, and the boats being sent to sound a bay that promised good anchorage, the Indian canoes flocked round them. The Captain, apprehensive that their designs were hostile, made a signal for the boats to return to the ship, and fired a gun over the heads of the Indians. Though they were frightened at the report, they attempted to prevent the return of the cutter; but she easily out-failed them. This being observed by some canoes in a different station, they intercepted her, and wounded some of her people with stones, which occasioned the firing a musquet, and some shot were lodged in the shoulder of the man who began the attack; which the Indians observing, they all made off with the utmost precipitation. The boats having reached the ship preparations were made for sailing, but a large canoe making towards her at a great rate, it was resolved to wait the event of her arrival; on which an Indian, making a speech, threw a plantain branch on board, and the Captain returned the compliment of peace, by giving them a branch, which had been left on board by the other Indians; some toys being likewise given them, they departed very well satisfied. We now sailed, and the next morning were off a peak of land which was almost covered with the natives and their houses. On the 21st the ship anchored, and several canoes came along-side of her, bringing a large quantity of fruit, with fowls and hogs, for which they received nails and toys in exchange.

The boats having been sent to sound along the coast, were followed by large double canoes, three of which ran at the cutter, staved in her quarter, and otherwise damaged her, the Indians at the same time, armed with clubs, endeavouring to board her; the crew now fired, and wounded one man dangerously, and killing another, they both fell into the sea, whither their companions dived after them, and got them into the canoe. They now tried if they could stand or fit, but as one was quite dead, they laid him at the bottom of the canoe, and the wounded man was supported in a sitting posture. The ships boats kept on their way, while some of the canoes went on shore, and others returned to the ship to renew their merchandise. While the boats continued out in several soundings, the natives swam off to them with water and fruit. The women were particularly urgent for the sailors to land, and, putting off all their cloaths, gave hints, of the most indelicate nature, how acceptable their company would be. The boats being sent on shore with some small casks to get water, the Indians filled two of them, and kept all the rest for their trouble. When the boats came off, the shore was crowded with thousands of men, women, and children. During this time, several canoes remained along-side the ship, but the Captain would not permit a single Indian to go on board, as there was no guarding against their artful dispositions.

On Monday the 22nd, the natives brought hogs, poultry, and fruit to the ship, which they bartered for knives and other things, so that the whole crew was supplied with

with meat for two days, by means of this traffic. The boats having been this day sent for water, every inducement was used by the inhabitants to persuade them to land, and the behaviour of the women was still more lascivious than before. Having procured a small quantity of water, the boats put off: on which the women shouted aloud, pelted them with apples and bananas, and shewed every mark of contempt and dereliction. On the 23rd, we made sail, with intention to anchor off the watering-place, but, the man at the mast-head discovering a bay a few miles to the leeward, we immediately stood for it. The boats which were a-head, making a signal for an anchorage, we prepared to bring to; but when the ship had almost reached the place, she suddenly struck, and her head remained immovable, fixed on a coral rock; in which situation she remained near an hour, when she was happily relieved by a breeze from the shore. During the whole time that she was in danger of being wrecked, she was encompassed by hundreds of Indians in their canoes; but not one of them attempted to board her. The Dolphin was now piloted round a reef, into an harbour, where she was moored. The master was then sent to sound the bay, and found safe anchorage in every part of it. In the mean time some small canoes brought provisions on board; but as the shore was crowded with large canoes, filled with men, the Captain loaded and primed his guns, supplied his boats with musqueteers, and kept a number of men under arms.

On Wednesday the 24th, the ship sailed up the harbour, and many canoes followed us, bringing provisions, which were exchanged for nails, knives, &c. A number of very large canoes advanced in the evening, laden with stones, on which the Captain ordered the strictest watch to be kept. At length some canoes came off, which had on board a number of women, who being brought almost under the ship, began to practise those arts of indelicacy already mentioned. During this singular exhibition the large canoes came round the ship, some of the Indians playing on a kind of a flute, others singing, and the rest blowing a sort of shells. Soon after a large canoe advanced, in which was an awning; and on the top of it sat one of the natives, holding some yellow and red feathers in his hands. The Captain having consented to his coming along-side, he delivered the feathers, and while a present was preparing for him, he put back from the ship, and threw the branch of a cocoa-tree in the air. This was, doubtless, the signal for an onset, for there was an instant shout from all the canoes, which, approaching the ship, poured volleys of stones into every part of her. On this two guns, loaded with small shot, were fired, and the people on guard discharged their musquets. The number of Indians round the ship were full 2000, and though they were at first disconcerted, they soon recovered their spirits, and renewed the attack. Thousands of the Indians were now observed on shore, embarking as fast as the canoes could bring them off: orders were therefore given for firing the cannon, some of which were brought to bear upon the shore. This firing put a stop to all hostilities on the part of the Indians, for a small time; but the scattered canoes soon got together again, and, having hoisted white streamers, advanced, and threw stones of two pound weight from slings, by which a number of the seamen were wounded. At this time several canoes approached the bow of the ship, from whence no shot had been yet discharged. In one of these was an Indian, who appeared to have an authority over the rest, a gun was therefore levelled at his canoe, the shot of which split it in two pieces. This put an end to the contest, the canoes rowed off with the utmost speed, and the people on shore ran and concealed themselves behind the hills.

After this skirmish we sailed for our intended anchoring place, and moored the ship within a little distance of a fine river. Some of our people who had been sent to survey the shore, returned the next morning with an account that they had found good fresh water (produced from the river above-mentioned) but that there was

not a canoe to be seen. Mr. Furneaux was sent the same day with all the boats, well manned and armed, and a number of marines, having orders to land his men under cover of the ship and boats. This being accordingly effected, he turned a piece of turf, and having hoisted a broad pendant upon a staff, took possession of the isle for his Britannic majesty, naming it King George the Third's Island. Some rum being then mixed with the river-water, the king's health was drank by every person present. During the performance of this ceremony, two old men were seen on the opposite side of the river, who put themselves in a supplicating posture, and appeared to be much terrified. On this, the English made signs to them to cross the river. One of them obeying the signal came over, and crawled on his hands and knees towards the lieutenant, who shewed him some stones that had been thrown at the vessel, but took pains at the same time, to intimate, that no injury should be done to the Indians, if they were not the aggressors. He then caused some hatchets to be produced, giving the Indian to understand that his people would be glad to exchange them for various kinds of provisions. Some trifles were also given to this old man, who expressed his gratitude by his gestures, and by dancing round the flag-staff, but when they saw the pendant shaken by the wind, they ran back, with signs of fear and surprise. When they had recovered themselves from their fright, they brought two hogs which they laid down, and began dancing round the pendant as before. The hogs were afterwards put into a canoe, which the old Indian rowed towards the ship; and when he came along-side of her, pronounced a serious oration, in the course of which he delivered a number of plantain leaves, (one at a time, somewhat in the manner of the North Americans, closing their periods with belts of wampum.) After this he rowed back again, refusing at that time to accept of any presents. The noise of drums and other instruments was heard this night, and the next morning it was observed that the pendant was taken away, and the natives had quitted the coast. While the casks were filling with water, the old Indian already mentioned, crossed the river, and brought the English some fowls and fruits. At this time the Captain was ill, but though he was confined to the vessel, he had remarked from thence by the help of glasses what was doing on shore. In the course of his observations, he perceived many of the natives creeping behind the bushes towards the watering-place, at the same time that vast numbers advanced through the woods, and a large party came down the hill in view; all tending to the same quarter. Two divisions of canoes were besides seen making round the opposite sides of the bay. As the lieutenant had likewise observed the threatened danger, he got his people on board the boats; previous to which he had sent the old Indian to intimate to his countrymen that the crew wanted nothing but water, and to prevail on them to keep at a proper distance whilst it was filling; but so far was this from having the proper effect, that the islanders made a prize of the casks, and those at some distance from the watering-place, went forward with all expedition, in order to keep pace with the canoes, which rowed along very swiftly. At the same time a number of women and children took their station on a hill, which commanded a prospect of the shipping. The canoes drawing near that part of the bay where the vessel was at anchor, took in many from the shore who were laden with bags filled with stones. Then they rowed towards the ship, on which orders were given to fire on the first party that approached in the canoes, which being done, the Indians made off frightened and astonished. Captain Wallis being now resolved that this action should put an end to all disputes, incensed at the behaviour of the natives, commanded his people to fire first into the wood, and afterwards towards the hill, whither the islanders had retreated; when finding at what a distance the guns could reach them, they dispersed and disappeared. After this, the boats were sent out, a strong guard being appointed to attend the carpenters,

General's ship
LORD NELSON

London: Published by the Author, 1794. The King's Printer, at the Strand.

CAPT. WALLIS, on his arrival at O'TAHEITE, in conversation with OBEREA the QUEEN, while her attendants are performing a sacred DANCE called the TINRODEE. —

George Cooke del.

who, according to orders, destroyed all the Indian canoes which could be met with. At length a small party of the natives came to the beach, stuck up some small branches of trees, as if for tokens, and then retreated to the woods; however they came again, and brought some hogs and dogs with their legs tied, which they left on the shore, together with a quantity of such cloth as they wore, all which they made signs to the sailors to take away. On this, a boat was dispatched which conveyed the hogs on board, but left behind the other articles; hatchets and nails were also deposited on the beach in return for these presents, but the Indians would by no means accept them till the cloth was taken away.

On Saturday the 27th, a party being employed in filling water, the old Indian was seen on the opposite side of the river. After having delivered an oration in his manner, he came over, when the officer referred him to the bags and stones which had been brought down, and used his endeavours to convince him that the English in the late action had acted only from motives of self defence. The old man, however, seemed to think his countrymen much aggrieved, and with great openness intimated his opinion. However at last he suffered himself to be reconciled, shook hands with the lieutenant, and accepted some presents from him. It was then hinted to him that it would be best for the people of the island to appear only in small parties for the future, with which terms the Indian appeared satisfied, and an advantageous traffic was afterwards established with the natives. Matters being thus settled, the sick were sent on shore, and were lodged, under the care of the surgeon, in tents near the watering place. This gentleman shooting a wild duck, it dropped on the opposite side of the river, in the presence of some Indians, who fled directly; but stopping within a short space, one of them was at last persuaded to bring the duck over, which he laid at the surgeon's feet, but, at the same time, the agitation of his mind was visible in his countenance. Three ducks were killed by a second shot, and the natives were by this time possessed with such a notion of the effects of fire-arms, as whilst it raised their admiration, was supposed to contribute in a great measure to their good behaviour towards the English during their stay in these parts, though there might be another reason assigned for this before their departure, as will be apparent in the sequel. The gunner was now appointed to manage all affairs of trade between the Indians and the sailors, in order to prevent quarrelling and pilfering. This was a judicious choice; the natives sometimes stole certain trifles, but immediate restitution was made on the sight of a gun. Besides, the old Indian made himself very serviceable in recovering any thing that might have been taken away. In particular, an Indian swam one day over the river, and pilfered a hatchet, on which the gunner making preparations, as if he meant to go in search of him, the goods were restored by the old man's means, and the offender was also delivered up to the gunner. Though he had committed other robberies, yet the Captain discharged him; and all his punishment consisted in his terrible apprehensions. Being restored to his countrymen, he was conducted to the woods in the midst of their shouts of applause. This man had the gratitude to bring a roasted hog and some bread fruit to the gunner next day, as an acknowledgement for the lenity shewn him. The Captain, first lieutenant, and purser, were at this time very ill; so that the charge of the vessel, and the care of the sick, were committed to Mr. Furneaux, the second lieutenant, who discharged his duty with zeal and fidelity; and fruit, fowls, and fresh pork, were procured in such plenty that at the end of fourteen days almost every man had perfectly recovered his health. A piece of salt petre, of the size of a small egg, had been found on the 25th on the shore; but whether it was brought from the ship or not, could not be learned, after the most diligent enquiry; but however, no other piece was found. On the 2nd of July, we began to want fruit and fresh meat, owing to the

absence of the old Indian, but we had still a sufficient supply for the sick. On the 3rd, the ship's bottom was examined, when its condition was found to be nearly the same as when she left England. This day a shark was caught, which proved an acceptable present to the natives. The old Indian, who had visited the interior parts of the island in quest of provisions, returned on the 5th, and brought with him a roasted hog as a present for the Captain, who in return, gave him a looking-glass, an iron pot, &c. His return was soon followed by some of the natives, who had never yet visited the market, and who brought some hogs that were larger than any yet purchased. Another sort of traffic was now established between the Indian girls and the sailors. The price of a female's favours was a nail or two; but as the seamen could not always get at the nails, they drew them out of several parts of the ship; nor could the offenders be discovered by the strictest enquiry. The damage done to the vessel might have been easily repaired; but a worse consequence arose from this traffic; for on the gunner's offering small nails for hogs, the Indians produced large spikes, demanding such as those. Some of the men made use of a particular device to gratify their passions; for when they could procure no more nails, they cut lead into the shape of them, and passed those pieces on their unsuspecting paramours. When the Indians discovered the fraud, they demanded nails for the lead; but this just demand could not be granted, because it would have promoted the stealing of lead, and likewise injured the traffic with iron. In consequence of their connection with the women, the sailors became so impatient of controul, that the articles of war were read, to awe them into obedience; and a corporal of marines was severely punished, for striking the master at arms. The Captain's health being nearly restored, he went in his boat to survey the island, which he found extremely delightful, and every where well peopled.

On Wednesday the 8th, the wood-cutters were entertained in a friendly manner by certain Indians, who seemed to be of a rank above those they had yet seen, and some of these visiting the Captain, he laid before them a thirty-six-shilling piece, a guinea, a crown-piece, a dollar, some shillings, some new half-pence, and two large nails, intimating that they might take their choice, when they eagerly seized the nails, and then took a few half-pence, but left all the other pieces untouched. The Indians now refused to supply the market, unless they could get large nails in exchange: the Captain therefore ordered the ship to be searched, when it was found that almost all the hammock-nails were stolen, and great numbers drawn from different places; on which every man was ordered before the Captain, who told them, that not a man should go on shore till the thieves were discovered; but no good consequence arose from his threats, at that time. Three days after, the gunner conducted to the ship a lady of an agreeable face, and portly mein, whose age seemed to be upwards of forty. This lady had but lately arrived in that part of the island, and the gunner observing that she seemed to have great authority, presented her with some toys; on which she invited him to her house, and gave him some fine hogs. She was afterwards taken on board, at her own desire. Her whole behaviour shewed her to be a woman of fine sense and superior rank; the Captain presented her with a looking-glass and some toys, and gave her a handsome blue mantle, which he tied round her with ribbands. As she then intimated that she should be glad to see him on shore, he signified his intention of visiting her the next day. Accordingly, on Saturday the 12th, Captain Wallis went on shore, where she met him, attended by a numerous retinue, some of whom she directed to carry the Captain, and others who had been ill, over the river, and from thence to her habitation, and the procession was closed by a guard of marines and seamen. As they advanced, a great number of Indians crowded to see them; but, on a slight motion of her hand, they made room for the procession.

sion to pass. When they drew near her dwelling, many persons of both sexes advanced to meet her, whom she caused to kiss the Captain's hand, while she signified that they were related to her. Her house was 320 feet in length, and about 40 in breadth. The roof, which was covered with the leaves of palm-tree, was supported by a row of pillars on each side, and another in the middle. The highest part of the thatch on the inside, was 30 feet from the ground, and the space between the sides of the building and the edge of the roof, which was about 12 feet, was left open. The Captain, lieutenant, and purser, being seated, the lady helped four of her female attendants to pull off the gentlemen's coats, shoes, and stockings, which was awkwardly performed; the girls however smoothed down the skin, and rubbed it lightly with their hands for more than half an hour. The surgeon, being heated with walking, having pulled off his wig, one of the Indians screamed out, and the eyes of the whole company were instantly fixed on the wonderful sight, and they remained for some time fixed in surprise. After this, the queen ordered several bales of cloth to be brought out, which were the produce of the country, which were now destined for the dress of the Captain and his attendants. It was intended that the Captain should be carried as he had been before, but as he refused the offer, the queen walked arm in arm with him, and lifted him like an infant over such wet and dirty places as they came to in their way. She gave him a sow big with young, and took her leave when she had attended him to the beach. The gunner being dispatched to wait on her the next day with a present of bill-hooks, hatchets, &c. found her busied in entertaining some hundreds of the Indians who were regularly seated round her. She ordered a mess to be provided for the gunner, which he found to be very agreeable, and supposed to be fowls and apples cut small, and mixed with salt water. The provisions which were distributed by the queen, were served in cocoa-shells, which her servants brought in a sort of trays. This lady took her seat somewhat above the rest of the company, and when they were supplied, was fed by two women servants, standing on each side of her. It was observed that she received the Captain's presents with an air of great satisfaction, and the supply of provisions brought to market was now greater than ever, but the prices were raised, in a great measure owing to the commerce between the English seamen and the women of the Island, of which we have taken notice; for which reason, besides the orders given for restraining the people belonging to the crew from going on shore, it was also thought proper to prohibit any women from passing the river.

On Tuesday the 14th of this month, the gunner being on shore, discovered a woman on the opposite side of the river, who seemed to be weeping in a most piteous manner. Perceiving that he seemed to take notice of her apparent distress, she sent a youth to him, who having made a long oration, laid a branch of plantain at his feet, after which he went to fetch the woman, and also brought two hogs with him. The youth now made a long speech, and, in the end, the gunner was given to understand that her husband and three of her sons, had been killed when the English fired on the Indians as above related. She fell speechless on the ground after she had told her tale of woe, and two lads that attended her, seemed also to be much affected. The gunner seeing her distressed situation endeavoured to console her, and at last she became a little calmer, offered him her hand, and directed the hogs to be given him, nor would she accept any thing in return for her present. A large party rowed round the island in their boats on the 15th, in order to take a view of it, and to purchase provisions. Returning, they brought with them a number of hogs and fowls, and some cocoa-nuts. They found the island to be pleasant, and abounding with the necessaries of life, and saw a great number of canoes, several of which were not quite finished. The natives tools were formed of bones, stones, and shells. No other four-footed beasts but dogs and hogs, were

seen. The inhabitants ate all their meat either baked or roasted, as they neither had any vessel wherein water could be boiled, nor seemed to entertain an idea that it could be heated by fire so as to answer any useful purpose. One morning, when the lady we have mentioned was at breakfast, an Indian that attended her having observed the cock of an urn turned, to fill a tea-pot, he also turned the cock, when the scalding water falling upon his hand, he cried out and jumped about the cabin, while the Indians were equally surprised and terrified at the circumstance. The Captain received another visit from the queen on the 17th, and the same day a great quantity of provisions was purchased of some of the natives, whom we had never before dealt with. The next day the queen repeated her visit, and made the Captain a present of two hogs, and the master attending her home, she clothed him in the dress of the country, as she had done the Captain and his retinue. Our provisions received an increase on the 19th, by the gunner's sending on board a number of hogs and pigs, and abundance of fowls and fruits which he had purchased in the country. At this time an order was made that none of the sailors should be allowed to go on shore, except those that were appointed to procure wood, water, or other necessaries.

On Tuesday the 21st, the queen came again to visit Captain Wallis, and presented him with some hogs. She likewise invited the Captain to her house, who attended her home with some of his officers. She tied wreaths of plaited hair round their hats, and on the Captain's she put a tuft of feathers of various colours, by way of distinction. She came back with them as far as the water-side on their return, and ordered some presents to be put into the boat at their departure. Captain Wallis having intimated before they put off, that he should leave the island in seven days time, she made signs that she wished him to stay 20 days; but he repeating his resolution, she burst into a flood of tears. We were now so well stored with hogs and poultry, that our decks were covered with them, and as the men were more inclined to eat fruit than meat, they were killed faster than had been intended. The Captain presented his friend the old Indian with some cloth and other articles, and sent a number of things to the queen, among which were a cat with kitten, turkeys, geese, hens, and several sorts of garden seeds. This compliment was returned by a present of fruit and hogs. Pease and other European seeds were sowed here, and the Captain staid long enough to see them come up, and to observe that they were likely to thrive in the country.

On the 25th, a party was sent on shore in order to examine the country, and a tent was erected for the purpose of observing an eclipse of the sun. When it was ended, the Captain took his telescope to the queen, who shewed a surprise scarcely to be expressed, on discovering several objects with which she was well acquainted, but which were too distant to be seen without the help of a glass. He afterwards invited her and her retinue to come on board the ship, where an elegant dinner was prepared, of which all but the queen ate heartily; but she would neither eat nor drink. On the return of the party from their excursion, the queen was landed with her train. The Captain still keeping in the same mind as to the time of his departure, she wept again on being informed of his resolution. Our people, who had been sent out this day, reported, that on their first landing they called on the old Indian, and took him into their company, walking some on one side of the river, and some on the other, till the ground rising almost perpendicular, they were all obliged to walk on one side. On the borders of the valley through which the river flowed, the soil was black, and there were several houses with walled gardens, and plenty of fowls and hogs. In many places channels were cut to conduct the water from the hills to the plantations. No underwood was found beneath the trees, but there was good grass; the bread-fruit and apple-trees were set in rows upon the hills, and the cocoa-nut grew upon the

the level ground. The streams now meandered through various windings, and the crags of mountains hung over the travellers heads. When they had walked about four miles they rested, and began their breakfast under an apple-tree. At this time they were alarmed by a loud shout from a number of the natives. On this they were going to betake themselves to their arms, but the old Indian made signs that they should sit still. He then went to his countrymen, and it was presently observed that they became silent and withdrew. They afterwards returned, bringing with them some refreshments, in exchange for which they received buttons and other trifles from the lieutenant. The party then proceeded, looking every where for metals and ores, but found nothing of that sort worth attending to. And now the old Indian being tired, gave his English companions to understand that he was desirous of returning, but he did not leave them till he had given directions to the Indians to clear the way over a mountain. After his departure his countrymen cut branches from the trees, and laid them in a ceremonious manner at the feet of the seamen; they then painted themselves red with the berries of a tree, and stained their garments yellow with the bark of another. By the assistance of these people, the most difficult parts of the mountains were climbed, and they again refreshed themselves at its summit, when they saw other mountains so much above them, that they seemed as in a valley. Towards the sea, the prospect was inexpressibly beautiful, the sides of the hills being covered with trees, and the valleys with grass, while the whole country was interspersed with villages. They saw but few houses on the mountains above them, but as smoke was observed in many places, it was conjectured, that the highest were inhabited. Many springs gushed from the sides of the mountains, all of which were covered with wood on the sides and with fern on the summit. The soil even on the high land was rich, and the sugar cane grew without cultivation; as did likewise turmeric and ginger. Having a third time refreshed themselves, they descended towards the ship, occasionally deviating from the direct way, tempted by the pleasant situation of several houses, the inhabitants of which entertained them in the most hospitable manner. They saw parrots, parroquets, green doves, and ducks. The lieutenant planted the stones of cherries, peaches and plumbs, several kinds of garden seeds, and oranges, lemons and limes. In the afternoon they rested on a delightful spot, where the inhabitants dressed them two hogs and several fowls. Here they staid till evening, when they rewarded the diligence of their guides, and repaired to the ship.

On the 26th, the Captain was visited by the queen with her usual presents, and this day we discontinued taking in wood and water, and prepared for sailing. A greater number of Indians now came to the sea-shore, than we had ever yet seen; and of these several appeared to be persons of consequence. In the afternoon the queen visited Captain Wallis, and solicited him to remain ten days longer; but being informed that he should certainly sail on the following day, she burst into tears. She now demanded when he would come again, and was told in 50 days; she remained on board till evening, when being informed that the boat waited for her, she wept with more violence than she had yet done. At length this affectionate woman went over the ship's side, as did the old Indian who had been so serviceable to the crew. This man had signified that his son should sail with the Captain; but when the time came the youth was not to be found, from whence it was concluded that parental affection had caused the old man to forfeit his word. The next morning early two boats were sent to fill a few casks of water; but the officer, alarmed at finding the shore crowded with the natives, prepared to return. This occasioned the queen to come forward, who ordered the Indians to retire to the other side of the river, after which she made signs for the boats to come on shore. While they were filling the water she ordered some presents to

be put into the boat, and earnestly desired to go once more to the ship, but the officer being ordered not to bring off a single native, she ordered her double canoe out, and was followed by many others. When she had been on board for an hour, weeping and lamenting, we took advantage of a fresh breeze, and got under sail. She now embraced the captain and officers, and left the ship; but as the wind fell, the canoes put back, and reached the ship again, to which the queen's was made fast, and advancing to the bow of it she there renewed her lamentations. Captain Wallis presented her with several articles of use and ornament, all which she received in mournful silence. The breeze springing up again, the queen and her attendants took their final leave, and tears were shed on both sides.

The place where the ship had lain at anchor, was called Port Royal Harbour, and is situate in 17 deg. 30 min. of south lat. and 150 deg. of west long.

The following are the particulars we have selected of the customs, manners, &c. of the people of Otaheite. With regard to their stature, the men are from five feet seven to five feet ten inches high, the standard of the women, in general, near three inches shorter, the tallest among them being about five feet seven inches, they were mostly handsome, and some of them are described as being really beautiful. The complexion of such of the men as are much employed on the water is reddish, but their natural colour is what is called tawny. The colour of their hair is not like that of the East Indians and Americans, black, but is diversified like that of the Europeans, having among them black, brown, red, and flaxen; most of the children having the latter: when loose, it has a strong natural curl, but it is usually worn tied in two bunches, one on each side the head, or in a single bunch in the middle. They anoint the head with the oil of the cocoa-nut, mixed with a root of a fragrant smell. The women, as we have before observed, do not consider chastity as a virtue, for they not only readily and openly trafficked with our people for personal favours, but were brought down by their fathers and brothers for the purpose of prostitution: they were, however, conscious of the value of beauty; and the size of the nail that was demanded for the enjoyment of the lady, was always in proportion to her charms. When a man offered a girl to the caresses of a sailor, he shewed a stick of the size of the nail that was to purchase her company; and if our people agreed, she was sent over to them, for our seamen were not permitted to cross the river.

Their cloaths are formed of two pieces of cloth, made of the bark of a shrub, and not unlike coarse china paper. In one of them a hole is made for the head to pass through, and this hangs down to the middle of the leg, from the shoulders both before and behind; the other piece which is between four and five yards long, and nearly one broad, they wrap round the body, and the whole forms an easy, decent, and graceful dress. They adorn themselves with flowers, feathers, shells, and pearls. The last are worn chiefly by the women; the Captain purchased two dozen of a small size and good colour, but they were all spoiled by boring. Mr. Furneaux saw several, in his excursion to the west, but he could purchase none with any thing he had to offer. It is a universal custom with both sexes, to mark the hinder part of their thighs and loins with black lines in various forms. This is done by striking the teeth of an instrument, somewhat like a comb, just through the skin, and rubbing into the punctures a kind of paste made of soot and oil, which leaves an indelible stain. The boys and girls under twelve years of age are not marked, but we saw a few men whose legs were punctuated, and these appeared to be persons of distinction.

One of the principal attendants on the queen, was much more disposed to imitate our manners than the rest; and our people, with whom he soon became a favourite, distinguished him by the name of Jonathan. This man Mr. Furneaux clothed completely in an English dress, and it became him extremely well. As it

was shoal water at the landing place, our officers were carried by the Indians on shore, and Jonathan, assuming state with his new finery, would be carried by some of his people in the same manner. In attempting to use a knife and fork at meals, at first his hand always came to his mouth, and the victuals, on the end of the fork, went away to his ear. Besides the articles already mentioned, these people eat the flesh of dogs. Rats abound in the island, but, as far as we could discover, they make no part of their food. In their rivers are good tasted mullets, but they are neither large nor in plenty. On the reef are cray-fish, conchs, muscles, and other shell-fish, which they gather at low water, and eat raw with bread fruit before they come on shore. At a small distance from hence, they catch with lines, and hooks of mother of pearl, parrot-fish, groopers, and many other sorts, of which they are so fond, that we could seldom prevail upon them to sell us a few at any price. Their nets are of an enormous size, with very small meshes, with which they catch abundance of the small fry; but while they were using both nets and lines with great success, we could not catch a single fish with either; not even with their hooks and lines, some of which we had procured.

The manner in which they dress their food is somewhat singular. They first kindle a fire by rubbing the end of one piece of dry wood together, in the same manner as our carpenters whet a chissel. Having also dug a pit about half a foot deep, and two or three yards in circumference, they pave the bottom with large pebble stones, laid down smooth and even, and then kindle a fire in it with dry wood, leaves, and the husks of the cocoa-nut. When the stones are sufficiently heated, they take out the embers, and rake up the ashes on every side; then they cover the stones with a layer of green cocoa-nut tree leaves, and wrap up the animal that is to be dressed in the leaves of the plaintain: if a small hog they wrap it up whole, if a large one they split it. When it is placed in the pit, they cover it with the hot embers, and lay upon them bread-fruit and yams, which are also wrapped up in the leaves of the plaintain: over these they spread the remainder of the embers, mixing among them some of the hot stones, with more leaves upon them, and lastly, to keep the heat in, they close all up with earth. After a time proportioned to the size of what is dressing, the oven is opened, and the meat taken out, which is tender, full of gravy, and, in the opinion of Captain Wallis, better in every respect than that which is dressed in the European manner. Their only sauces are fruit and salt water; and their knives are made of shells, with which they carve very dexterously, always cutting from them. They were greatly astonished when they saw meat boiled in a pot by our gunner, who, while he presided over the market, used to dine on shore; but from the time that the old man was in possession of an iron pot, he, and his friends, had boiled meat every day. The iron pots which the Captain gave to the queen, were also constantly in use. The only liquor these people have for drinking, is water; and they are ignorant of the art of fermenting the juice of any vegetable, so as to give it an intoxicating quality. It is true they occasionally pluck and chew pieces of the sugar cane, but have no idea of extracting any spirit from it.

By the scars, with which many of these people are marked, it seems evident, that they sometimes engaged in war with each other. The remains of wounds that were visible appeared to be made with stones, bludgeons, or other blunt weapons. That they have skill in surgery, the following instance afforded us sufficient proof. One of our sailors, when on shore, had a large splinter run into his foot, and his messmate tried in vain to extract it with a pen-knife. The old Indian, who happened to be present, called over one of his countrymen, who was standing on the opposite side of the river, who, having examined the seaman's foot, went immediately down to the beach, and taking up a shell, broke it to a point with his teeth; with this instrument he laid open the place, and drew out the splinter. In the mean time the old man repaired to a wood, and returned with some

gum of the apple tree, and, having spread it upon a piece of cloth, applied it to the wound, which, in two days time, was perfectly healed. Our surgeon afterwards used this vulnerary balsam with great success. In this island are several sheds enclosed within a wall, and the area is generally paved with large round stones; but it appeared not to be much trodden, for the grass grew every where between them. On the outside of the wall were several rude figures resembling men, women, hogs and dogs, carved on posts, that were fixed in the ground. We do not think these places are set apart for religious worship, of which we could not discover the least traces among these people; but we conjecture they may be repositories of the dead, for we saw many of the natives enter them, with a slow pace and dejected countenance.

They have three kinds of canoes. One are formed out of single trees, used chiefly for fishing, and carry from two to six men. We saw many of these upon the reef. A second sort are made of planks sewed neatly together, and large enough to hold forty men. Two of them are generally lashed together, having two masts set up between them; but, if single, they have an outrigger on one side, and only one mast in the middle. They sail in these beyond the sight of land, probably to other islands, and bring home plantains, bananas, and other fruits. A third kind, not unlike the gondolas of Venice, are intended principally for show, and used by parties of pleasure. These are very large, but have not any sails. The middle is covered with a large awning, and some of the people sit upon it and some under it. On the first and second day after our arrival, some of these vessels came near the ship; but afterwards we only saw, three or four times a week, a procession of eight or ten of them passing at a distance, with streamers flying, and a great number of small canoes attending them. They frequently rowed to the outward point of a reef, that lay about four miles to the westward of us, where they continued about an hour and then returned. These processions are made only in fine weather, and on such occasions the people on board are dressed; though in the other canoes, they have nothing but a piece of cloth wrapped round the middle. Those in the large canoes, who rowed and steered, were dressed in white; those who sat upon the awning and under it, in white and red; and two men, who were mounted on the prow of each vessel, in red only. The planks of these vessels are made by splitting a tree, with the grain, into as many thin pieces as they can. The tree is first felled with a kind of hatchet, or adze, made of a hard greenish stone, fitted very completely into a handle: it is then cut into such lengths, as are required for the plank, one end of which is heated till it begins to crack, and then with wedges of hard wood they split it down; some of these planks are two feet broad, and from 15 to 20 feet long. They smooth them with adzes of the same materials and construction, but of a smaller size. We saw six or eight men sometimes at work upon the same plank, and, as their tools soon lose their edge, every man has by him a cocoa-nut shell filled with water, and a flat stone, whereon he sharpens his adze almost every minute. The planks are generally brought to the thickness of about an inch, and are afterwards fitted to the boat with the same exactness as would be expected from an expert joiner. To fasten these planks together, holes are bored, through which a kind of plaited cordage is passed, but our nails answered the purpose of fastening them together much better. The seams are caulked with dried rushes, and the whole outside of the canoe is paid with a gummy substance, produced from their trees, and which is substituted in the room of pitch. The wood which they use for their large canoes, is that of the apple tree; which grows very large and strait. Many of these measured near eight feet in the girth, and from twenty to forty in the branches, with very little diminution in the size. Their small canoes are nothing more than the hollowed trunks of the bread-fruit-tree, which is still more light and spongy. The trunk of this tree is six feet in girth.

In the opinion of Captain Wallis, this island of Otahete

heite is one of the most healthy as well as delightful spots in the world. The climate appears to be very good, and we saw no appearance of disease among the natives. The hills are covered with wood, and the valleys with herbage. The air in general is so pure, that, notwithstanding the heat, our flesh meat kept very well two days, and our fish one. We met with no frog, toad, scorpion, centipede, or serpent, of any kind; and the only troublesome insects that we saw were ants, of which there were but few. The south-east part of the island seems to be better cultivated and inhabited than where we lay, for we saw every day boats come round from thence laden with plantains and other fruits. While we lay off this island, the benefit we received, with respect to the ship's company, was beyond our most sanguine expectations, for we had not now an invalid aboard, except the two lieutenants, and the captain, and they were recovering, though still in a feeble condition.

Many assertions have been advanced with respect to the first introducers of the venereal disease into this island. "It is certain, (observes Captain Wallis) that none of our people contracted the venereal disease here, and therefore, as they had free commerce with great numbers of the women, there is the greatest probability that it was not then known in the country. It was, however, found here by Captain Cook in the Endeavour, and as no European vessel is known to have visited this island before Captain Cook's arrival, but the Dolphin, and the Boudeuse and Etoile, commanded by M. Bougainville, the reproach of having contaminated with that dreadful pest, a race of happy people, to whom its miseries had till then been unknown, must be due either to him or to me, to England or to France; and I think myself happy to be able to exculpate myself and my country beyond a possibility of a doubt. It is well known, that the surgeon on board his majesty's ships keeps a list of the persons who are sick on board, specifying their diseases, and the times when they came under his care, and when they were discharged. It happened that I was once at the pay table on board a ship, when several sailors objected to the payment of the surgeon, alledging, that although he had discharged them from the list, and reported them to be cured, yet their cure was incomplete. From this time it has been my constant practice when the surgeon reported a man to be cured, who had been upon the sick list, to call the man before me, and ask him whether the report was true: if he alledged that any symptoms of his complaint remained, I continued him upon the list; if not, I required him, as a confirmation of the surgeon's report, to sign the book, which was always done in my presence. A copy of the sick list on board the Dolphin, during this voyage, signed by every man in my presence, when he was discharged well, in confirmation of the surgeon's report, written in my own hand, and confirmed by my affidavit, I have deposited in the admiralty; by which it appears, that the last man on board the ship, in her voyage outward, who was upon the sick list for the venereal disease, except one who was sent to England in the store ship, was discharged cured, and signed the book on the 27th of December 1766, near six months before our arrival at Otaheite, which was on the 19th of June 1767; and that the first man who was upon the list for that disease, in our return home, was entered on the 26th of February 1768, six months after we left the island, which was on the 26th of July 1767; so that the ship's company was intirely free fourteen months within one day, the very middle of which time we spent at Otaheite; and the man who was first entered as a venereal patient, in our return home, was known to have contracted the disease at the Cape of Good Hope, where we then lay."

The old Indian, who had been so useful in carrying on an intercourse with the natives, had often intimated, that his son, a boy about fourteen years of age, should embark on board the ship; and the lad seemed well inclined to quit his country, and undertake the voyage; however, when the ship was about to sail, the youth thought fit to conceal himself, from a change of mind either in him or his father. A few months after the Dolphin left this island, M. de Bougainville touched

No. 32.

here, and with him one of the natives embarked; but from the disparity in their ages, it could not be the same person who had engaged to accompany Captain Wallis. The name of this adventurer was Aotourou. He left his country with great satisfaction and cheerfulness. His history is short, and as follows. The first European settlement that M. de Bougainville touched at, after leaving Otaheite, was Boero, in the Moluccas. The surprize of Aotourou was extravagant, at seeing men dressed in the European manner; houses, gardens, and various domestic animals, in great variety and abundance. Above all, he is said to have valued that hospitality that was there exercised, with an air of sincerity and freedom. As he saw no exchanges made, he apprehended the people gave every thing without receiving any return. He presently took occasion to let the Dutch understand, that in his country he was a chief, and that he had undertaken this voyage with his friends for his own pleasure. In visits, at table, and in walking, he endeavoured to imitate the manners and customs of the Europeans. When M. de Bougainville left Aotourou on board, on his first visit to the governor, he imagined the omission was owing to his knees being bent inwards, and with greater simplicity than good sense, he applied to some of the seamen to get upon them, supposing they would, by that means, be forced into a straight direction. He was very earnest to know if Paris was as fine as the Dutch factory where he then was. At Batavia, the delight which he felt on his first arrival, from the sight of the objects that presented themselves might operate, in some degree, as an antidote to the poison of the place; but during the latter part of their stay here, he fell sick, and continued ill a considerable time through the remainder of the voyage; but his readiness in taking physic, was equal to a man born at Paris. Whenever he spoke of Batavia afterwards, he always called it enoue mate "the land that kills." This Indian, during a residence of two years in France, does not appear to have done much credit to himself or his country. At the end of that time he could only utter a few words of the language; which indolent disposition M. de Bougainville excuses with great ingenuity and apparent reason, by observing, that, "he was at least thirty years of age; that his memory had never been exercised before in any kind of study, nor had his mind ever been employed at all. He was totally different from an Italian, a German, or an Englishman, who can, in a twelvemonth's time, speak a French jargon tolerably well; but then these have a similar grammar; their moral, physical, political, and social ideas are much the same, and all expressed by certain words in their language as they are in the French tongue; they have therefore little more than a translation to fix in their memories, which retentive faculties have been exercised from their infancy. The Otaheitean man, on the contrary, having only a small number of ideas, relative on the one hand, to the most simple and limited society, and, on the other, to wants which are reduced to the smallest number possible, he would have, first of all, as it were, to create a world of new ideas, in a mind as indolent as his body; and this previous work must be done before he can come so far as to adapt to them the words of an European language, by which they are to be expressed." But Aotourou seems to have kept very much below the standard, which the French apologist pleads he was not required to surpass; for he really was not able, after two years instruction, to translate his Otaheitean ideas, few and simple as they were, into French. This itinerant embarked at Rochelle A.D. 1770, on board the Brisson, which was to carry him to the isle of France, from whence, by order of the French ministry, he was to be sent by the intendant to his native country: and for this purpose, M. de Bougainville informs us that he gave sixteen hundred pounds sterling, (a third part of his whole fortune) towards the equipment of the ship intended for this navigation. But notwithstanding these endeavours to restore the adventurous Aotourou to his country and connections, he had not reached them when Capt. Cook was at Otaheite in 1774: and Mr. Forster says he died of the small pox.

C H A P. III.

The Dolphin sails from King George the Third's Island—Her passage from thence to Tinian—Sir Charles Saunders's—Lord Howe's—Scilly—Boscawen's—Keppel's—and Captain Wallis's islands discovered—The present state of Tinian described—Run from that island to Batavia—Incidents and transactions at this last place—The Dolphin continues her voyage to the Cape of Good Hope—Returns to England, and anchors in the Downs on Friday the 20th of May, 1768; having circumnavigated the Globe, from the time of weighing anchor in Plymouth Sound, in just 637 days; and accomplished her voyage a month and a day sooner than she had done when under the command of Commodore Byron.

ON Sunday the 26th of July, 1767, we took our departure from the island of Otaheite; and on the 27th, passed the Duke of York's Island, the middle and west end whereof is very mountainous, but the east end is lower, and the coast just within the beach abounds with plantain-trees, cocoa-nuts, bread-fruit, and apple-trees. On the 28th, we discovered land, which was called Sir Charles Saunders's Island. It is about six miles long from E. to W. and lies in latitude 17 deg. 28. min. south, and in 151 deg. 4 min. west longitude. On the weather side are many great breakers, and the lee-side is rocky, nevertheless, in many places there appears to be good anchorage. In the center is a mountain, which seems to be fertile. The few inhabitants we saw appeared to live in a wretched manner, in small huts, very different from the ingenious natives of King George's Island. Cocoa-nut and other trees grew on the shore, but all of them had their tops blown away. On the 30th, we again made land, at day-break, bearing N. by E. to N. W. We stood for it but could find no anchorage, the whole island being encircled by dangerous breakers. It is about ten miles in length, and four in breadth, and lies in latitude 16 deg. 46 min. south, and in 154 deg. 13 min. west longitude. On the lee part a few cocoa nuts were growing, and we perceived smoke, but no inhabitants. The Captain named this new discovered land Lord Howe's Island. In the afternoon we discovered in latitude 16 deg. 28 min south, longitude 155 deg. 30 min. west, a group of islands or shoals, exceeding dangerous; for in the night, however clear the weather, and by day, if it is hazy, a ship may run upon them without seeing land. At five o'clock we descried the breakers, running a great way to the southward; and soon after low land to the S. W. We turned to windward all night, and at nine o'clock, of the 31st, got round the shoals and named them Scilly Islands.

On Thursday the 13th of August, having continued our course westward, two small islands came in view. The first, at noon bore W. half S. distant five leagues, and had the appearance of a sugar loaf. The center of the second rose in the form of a peak, and bore W. S. W. distant six leagues. To one, which is nearly a circle, in diameter three miles, we gave the name of Boscawen's Island; and this we believe to be the only instance which occurs, of an island receiving the name of a deceased great man. Admiral Boscawen died in the year 1761. The other island, which is three miles and a half in length, we called Keppel's Isle. Port Royal at this time bore east 4 deg. south, distant 478 leagues. At two o'clock, P. M. we saw several inhabitants upon Boscawen's Island; but Keppel's being to windward, and appearing more likely to afford us good anchorage, we hauled up for it. At six, being distant therefrom nearly two miles, we observed, by the help of our glasses, many of the natives upon the beach; but we did not attempt to anchor, on account of some breakers at a considerable distance from the island. However, on the 14th, early in the morning, the boats were dispatched to sound and visit the island. At noon they returned, without having found any ground, within a cable's length of it; but seeing a reef of rocks, they had hauled round the same, and got into a large deep bay full of rocks: without this was anchorage from 14 to 20 fathoms, bottom sand and coral; and within a rivulet of good water; but the shore being rocky, they went in search of a better landing place, which they found about half a mile farther, and went ashore. Our people reported, that the inhabitants were not unlike

those of Otaheite; they were clothed in a kind of matting, and were remarkable for having the first joint of their little fingers cut off. They seemed to be peaceably inclined, and three of them from their canoes came into the boats when they put off, but suddenly jumped overboard, and swam back to the island, where about 50 of their countrymen stood on the shore ready to receive them, but who would not advance nearer than about 100 yards to our people. These brought on board two fowls, and some fruit, but they saw not any hogs. Till this day, Captain Wallis had entertained a design of returning to England by the way of the Magellanic Straits; but as no convenient watering place was to be found at this island, and as the ship had received some damages, that had rendered her unfit to encounter a rough sea, he determined to sail for Tinian, from thence to Batavia, and so home by the Cape of Good Hope. By this route, as far as we could judge, we expected to be sooner at home, and supposing the ship might not be in a condition to make the whole voyage, we should still have a greater probability of saving our lives, as from this place to Batavia, we should have a calm sea, and be not far from port. We think it rather extraordinary that a thought should be entertained by Captain Wallis, of returning by the way we came; as, independent of the prodigious unnecessary risk that would be run, the honour of having gone over the entire circumference of the globe would have been lost: for a voyage into the South Sea would have had nothing attractive in its sound; but a voyage round the world, was calculated to draw general attention. In consequence of the above resolution, we passed Boscawen's Island, which is well inhabited, and abounds with timber; but Keppel's is by far the largest and best Island of the two. The former lies in latitude 15 deg. 50 min. south, longitude 175 deg. west; and the latter in latitude 15 deg. 55 min. longitude 175 deg. 3 min. west from London. We continued our course W. N. W. and,

On Sunday the 16th, at ten o'clock, A. M. we discovered land bearing N. by E. and at noon were within three leagues of it. Within shore the land appeared to be high, but at the water-side it was low; and seemed to be surrounded with reefs that extended two or three miles into the sea. The coast is rocky, and the trees grow almost to the edge of the water. We hauled without a reef of rocks, to get round the lee-side of the island, and at the same time sent off the boats to sound and examine the coast. Our people found the trees to be of different sorts, many of them very large, but all without fruit: on the lee-side indeed were a few cocoa-nuts, but not a single habitation was to be seen; nor any kind of animals, either birds or beasts, except sea fowl. Soon after they had got near the shore, several canoes came up to them, each having six or eight men on board. They appeared to be a robust, active people, and were clothed with only a kind of mat that was wrapped round their waists. They were armed with large maces or clubs, such as Hercules is represented with, two of which they sold to our master for a few nails and trinkets. These people attempting to steal the cutter, by hauling her upon the rocks, a gun was fired close to one of their faces, the report of which so terrified them, that they decamped with the utmost speed. When the boats, on their return to the ship, came near to deep water, they were impeded by points of rocks standing up, the whole reef, except in one part, being now dry, and a great sea broke over it. The Indians observing this followed our boats in their canoes,

canoes, all along the reef till they got to the breach, and then they rowed back. We shall here remark, as an extraordinary circumstance, that although no sort of metal was seen on any of the lately discovered islands, yet the natives were no sooner possessed of a piece of iron than they began to sharpen it, but did not treat copper or brass in the same manner. When the boats returned, which was about six in the evening, the master reported, that all within the reef was rocky, but that at two or three places without it there was good anchorage in 18, 14, and 12 fathoms, upon sand and coral. The opening in the reef is 60 fathoms broad, where, if pressed by necessity, a ship may anchor, or moor, in eight fathoms; but it will not be safe to moor with a greater length than half a cable. This island the officers called after the name of our commander, Wallis's Island. It is situated in latitude 13 deg. 18 min. south, and in 177 deg. west longitude. Having hoisted in our boats we ran down four miles to leeward, where we lay till the morning; and then, finding that the current had fet us out of sight of the island, we made sail to the N. W.

On Friday the 28th, we crossed the line into northern latitude, our longitude being, by observation, 187 deg. 24 min. west from London. During this course many birds were seen about the ship, one of which was caught, and resembled exactly a dove in size, shape, and colour. On the 29th, in latitude 2 deg. 50 min. north, and in 188 deg. west longitude, we crossed a great rippling, which stretched from the N. E. to the S. W. as far as the eye could reach from the mast-head. We founded, but found no bottom, with a line of 200 fathoms.

On the 3rd of September, being Thursday, we saw land, which was thought to be two of the Piscadone Islands. The latitude of one of them is 11 deg. north, longitude 192 deg. 30 min. west, and that of the other 11 deg. 20 min. north, longitude 192 deg. 58 min. At five o'clock, A. M. we saw more land in the N. W. and at six, in the N. E. observed an Indian prow, such as is described in the account of Lord Anson's voyage. Perceiving she made towards us, we hoisted Spanish colours: but she came no nearer than within two miles, at which distance she tacked, stood to the N. N. W. and was out of sight in a short time. On the 7th, we saw a curlew, and on the 9th, we caught a land bird, very much resembling a starling. On Thursday the 17th, we observed in latitude 15 deg. north, longitude 212 deg. 30 min. W. On the 18th, at six o'clock, A. M. we descried the island of Saypan, bearing W. by N. distant ten leagues. In the afternoon we came in sight of Tinian, made sail for the road; and on Saturday the 19th, we came to an anchor in 22 fathoms, sandy ground, at about a mile distant from the shore, and half a mile from the reef. We lost no time, after the ship was secured, in sending the boats on shore, to erect tents, and procure some refreshments. In a few hours they returned with oranges, limes, and cocoa-nuts. The surgeon, with all the invalids, were landed with the utmost expedition; also the smith's forge, and a chest of carpenter's tools. The Captain and first lieutenant, both being in a very sickly condition, went likewise ashore, taking with them a mate and 12 men to hunt for cattle in the country. On the 20th, the master informed us, that there was a better situation to the southward; we therefore warped the ship a little way up, and moored with a cable each way. At six o'clock in the evening, our hunters brought in a fine young bull, of near 500 weight, part of which we kept on shore, and sent the remainder on board, with a good supply of fruit. The amount of the people now on shore, sick and well, was 53. On the 21st, we began the necessary repairs of the ship. The carpenters were set at work to caulk her: all the sails were got on shore, and the sail-makers were employed to mend them: while the armourers were busy on the iron work, and making new chains for the rudder. The sick recovered very fast from the day they first breathed the land air: this, however, was so different from what we found it in Oraleite, that flesh meat,

which there kept sweet two days, could here be scarcely kept sweet one. Near the landing-place we saw the remains of many cocoa-nut trees, which had all been wantonly cut down for the fruit; and we were obliged to go three miles into the country to procure a single nut. The hunters also suffered incredible fatigue, going frequently 10 or 12 miles, through one continued thicket, and the cattle were so wild, that it was very difficult to come near them. On this account one party was ordered to relieve another; and Mr. Gore with 14 men were stationed at the north part of the island, where cattle were in much greater plenty. At day-break every morning, a boat went off to bring in what they caught, or killed, and in this island we procured beef, poultry, papaw apples, and all the other refreshments, of which an account is given in Lord Anson's voyage; but which differs in some particulars from the report made of this place by Commodore Byron. During our stay at this place, the ship was laid down by the stern, to get at some of the sheathing which had been much torn; and in repairing the copper, the carpenter discovered and stopped a leak under the lining of the knee of the head, by which we had reason to hope most of the water, that the vessel had lately admitted in foul weather, came in.

On Thursday the 15th of October, all the sick being recovered, our wood and water completed, and the Dolphin made fit for sea, every thing was ordered on board from the shore; and all our men were embarked from the watering-place, each having, at least, 500 limes; and we had several tubs full of the same fruit on the quarter deck, for every one of the crew to squeeze into his water what he should think fit. On the 16th, at day break, we weighed, and sailed out of the bay, sending the boats at the same time to the north end of the island, to bring off Mr. Gore and his hunters. At noon they came on board with a fine large bull which they had just killed. On Wednesday the 21st, we held on a westerly course; and on the 22nd, Tinian being distant 277 leagues, we saw several birds, particularly three resembling gannets, of the same kind that we had seen when within about 30 leagues of Tinian. On the 23rd, and the two following days it blew a violent storm, and we had much thunder, lightning, rain, and a great sea. The ship laboured very much: the rudder became again loose, and shook the stern, a defect which we had before experienced, and which we thought had been remedied at Tinian. The gales increasing split our gib and main-top-mast stay-fail: the fore-fail, and mizen-fail were torn to pieces; and, having bent others, we wore, and stood under a reefed fore-fail, and balanced mizen. The effects of the storm were more dreaded, as the Dolphin admitted more water than she had done at any time during the voyage. Soon after we had got the top-gallant-masts down upon the deck, and took in the gib-boom, a sea struck the ship upon her bow, and washed away the round-houses, with all the rails of the head, and every thing upon the fore-castle: nevertheless, we were forced to carry as much sail as the ship would bear, being by Lord Anson's account near the Bashee Islands; and by Commodore Byron's, not more than 30 leagues, with a lee-shore. The incessant and heavy rain had kept every man on board wet to the skin for more than two days and two nights, and the sea was breaking continually over the ship. A mountainous one, on Tuesday the 27th, flaved all the half ports to pieces on the starboard-side, broke all the iron stanchions on the gunwale, washed the boat off the skids, and carried many things overboard. We were, however, this day favoured with a gleam of sunshine; and on the 28th, the weather became more moderate. At noon we altered our course, steering S. by W. and past one o'clock, we saw the Bashee Islands bearing from S. by E. to S. S. E. distant six leagues. These are all high, but the northernmost is higher than the rest. Grafton Island, one of them is laid down by Captain Wallis in the latitude of 21 deg. 4 min. north, and in 239 deg. west longitude; but Captain King, in his relation of the conclusion of the last voyage of discovery

covery, asserts that this is erroneous, as the Resolution and Discovery sought for them in vain in that position; and Mr. Dalrymple in his maps has laid them down in 118 deg. 14 min. east longitude. At midnight of this day, the weather being very dark, with sudden gusts of wind, we missed one Edmund Morgan, a marine taylor. It was supposed he had fallen overboard, when under the influence of intoxication, he having found means to indulge himself with more than his allowance.

On Tuesday the 3rd of November, at seven o'clock, A. M. we discovered a ledge of breakers, in latitude 11 deg. 8 min. north, distant three miles. At eleven we saw another shoal in latitude 10 deg. 46 min. N. distant five miles. At noon we hauled off, being distant from them not more than one fourth of a mile. At one o'clock P. M. we saw shoal water on our larboard bow, and, standing from it, passed another ledge of breakers at two. At three o'clock we had in sight a low sandy point, in latitude 10 deg. 40 min. N. and in 247 deg. 12 min. west longitude, to which the name was given of Sandy Isle. At five, in 10 deg. 37 min. N. latitude and in 247 deg. 16 min. W. long. we saw a small island, which was named Small Key. Soon after, in latitude 10 deg. 20 min. N. longitude 247 deg. 24 min. another larger was seen, and called Long Island. On Wednesday, the 4th, we fell in with a fourth island, in latitude 10 deg. 10 min. N. and in 247 deg. 40 min. W. longitude. This we named New Island. On Saturday, the 7th, having continued our course, we passed through several rippings of a current: and this day we saw great quantities of drift wood, cocoa-nut leaves, things like cones of firs, and weeds, which swam in a stream N. E. and S. W. At noon we observed in latitude 8 deg. 36 min. N. longitude 253 deg. W. At two o'clock, P. M. we descried from the mast head the island of Condore, which lies in latitude 8 deg. 40 min. N. and in 254 deg. 15 min. west longitude by our reckoning. On the 8th, we altered our course, and on the 9th, the Captain took from the petty officers and fore-mast men all their log and journal books relative to the voyage. On Friday the 13th, we came in sight of the islands Timoun, Aros, and Pefang. On Monday the 16th, we again crossed the line into south latitude, in the longitude of 255 deg. W. and soon after we saw two islands, distant seven leagues. On the 17th, we had tempestuous weather with heavy rain. The two islands proved to be Pulo Tote, and Pulo Weste; and having made sail till one o'clock P. M. we saw at that time the seven islands. On the 18th, at two o'clock, A. M. a singular incident happened. At this time the weather was so tempestuous and dark, that we could not see from one part of the ship to the other, we had also heavy squalls and much rain. During the full violence of the wind, a flash of lightning suddenly discovered a large vessel close aboard of us. The steersman instantly put the helm a lee, and the Dolphin answering her rudder, just cleared the other ship, and thus escaped the impending destruction, which threatened to bury for ever in the vast deep every circumstance of the voyage. This was the first ship that had been seen since our parting with the Swallow in April; and it blew so hard, that, not being able to understand any thing that was said, we could not learn to what nation she belonged. The weather having cleared up at six o'clock, A. M. we saw a sail at anchor in the E. S. E. and at noon came in sight of Pulo Taya, near which we anchored at six in the evening, in 15 fathoms, sandy ground. On the 19th we sailed again, and saw two vessels a-head of us, but, finding we lost much ground, came to an anchor again in 15 fathoms. On Friday the 20th, our small bower anchor parted, and could not be recovered. We immediately took in the cable, and perceived that it had been cut through with the rocks. On the 22nd, at half an hour after six A. M. we saw the coast of Sumatra; and cast anchor in Batavia road on Monday, the 30th.

On Tuesday, the 1st of December, we saluted the governor with 13 guns, which, contrary to the usual custom, he returned with one more, instead of one less,

from the fort; and permission having been obtained to purchase provisions, we were soon supplied with beef, and plenty of vegetables, which the Captain ordered to be served immediately: at the same time he told the ship's company, that he would not suffer any liquor to be brought on board, and would severely punish those who made such an attempt, observing, in order to reconcile them to this regulation, that intemperance, particularly in a too free use of arrack, would inevitably destroy them. As a further preservative, the captain would not suffer a man to go on shore, except upon duty, nor were even these permitted to go into the town. At this time 14 sail of Dutch East Indiamen, and a great number of small vessels were laying in this road. Here also we saw the Falmouth, an English man of war, of 50 guns, lying upon the mud in a rotten condition. She touched at this inhospitable place, on her return from Manila, in the year 1762, and was condemned. On examining the stores and ship, every thing was found in so decayed a state, as to be totally useless. The officers and crew of this ship were in a miserable condition. The boatswain through vexation and distress had lost his senses, and was at this time in a Dutch hospital: the carpenter was dying; and the cook a wounded cripple. The warrant officers belonging to this wreck presented a petition to Captain Wallis, requesting that he would take them on board the Dolphin. They stated, that nothing now remained for them to look after; that they had ten years pay due, which they would gladly relinquish, to be relieved from their present sufferings, as the treatment they received from the Dutch was most inhuman. They were not permitted to spend a single night on shore, and in sickness no one visited them on board: they were besides robbed by the Malays, and in continual dread of being murdered by them. Captain Wallis told them, with the utmost regret and compassion, that the relief they prayed for, it was not in his power to render; that as they had received charge of stores, they must wait for orders from home; but he assured them he would do all in his power to relieve them; and with this remote consolation only, the poor neglected, forgotten, unassisted suffering Englishmen took their leave with tears in their eyes. About six months before Captain Cook touched at Batavia, on board the Endeavour, in 1770, the Dutch thought fit to sell the Falmouth, and all her damaged stores, by public auction, and sent the officers home in their own ships.

The exorbitant prices which were demanded for cordage, and every other article which the Dolphin stood in need of, obliged Captain Wallis to leave the place without procuring anything of that kind, although his need of them was very great. During our stay at this place, which was eight days, the most salutary regulations were established, in order, if possible, to preserve the crew from the malignity of the climate; and the most beneficial consequences ensued. The ship's company continued sober and healthy the whole time; for, except a sailor who had been afflicted with rheumatic pains ever since we had left the Straits of Magellan, only one man was on the sick list.

On Wednesday the 2nd, our boatswain and carpenter were sent to examine such of the stores, belonging to the Falmouth, as had been landed at Onrust, with orders, that if any were fit for our use they should be purchased. On their return they reported, that all the stores they had surveyed were rotten, except one pair of tacks, which they brought with them: the masts, yards, and cables, were all dropping to pieces; and even the iron work was so rusty that it was worth nothing. They also examined her hull, and found her in a most shattered condition. Many of her ports were washed into one; the stern post was quite decayed; and there was no place in her where a man could be sheltered from the weather. The few unhappy sufferers who remained in her, were in as wretched a state as the ship, being quite broken and wore down, and expecting to be drowned as soon as the monsoon should set in. Among other necessities, we were in want of an anchor,

anchor, and of three inch rope for rounding the cables; but the officers, whom the Captain sent to procure these articles from the Dutch, as he could not be supplied with them from the Falmouth, reported, that the price which had been demanded for them was so unreasonable, that they had not agreed to give it. On Saturday the 5th, therefore, the Captain himself went on shore, for the first time, but found it impossible, after having visited the various store-houses and arsenals, to make a better bargain than his officers would have done. We now suspected that the Dutch thought to take advantage of our apparent necessity, and, supposing we could not depart without what we had offered to purchase, were determined to extort from us more than four times its value. But the Captain resolved to make any shift, rather than submit to what he knew to be a shameful imposition, and therefore told them, that he would give them till next Tuesday to come to his terms, at which time, if they did not, he would certainly, if it were possible, set sail without taking the things he had treated for. Accordingly, on the 8th, having heard nothing more about the anchor and rope, we failed from the road of Batavia, at six o'clock, A. M. On Friday the 11th, at noon, we were between the coasts of Sumatra and Sava, when several of the crew began to be affected with colds and fluxes. On the 12th, a Dutch boat came along side, and some turtles were purchased for the use of our company. At night, being at the distance of two miles from the Java shore, we saw an amazing number of lights on the beach, intended, as we imagined, to draw the fish near thereto. On the 14th, we anchored off Prince's Island, at which place we took in wood and water; and the next morning, the natives came down with turtle, poultry, and hog-deer, which they parted with at moderate rates. Here we lay till the 19th, during which time one of the seamen fell from the main-yard into the barge, which lay along-side the ship, by which accident he was dreadfully bruised, and many of his bones were broken. In his fall he struck two other men, one of whom was so much hurt, that he continued speechless for a few days, and then died; but the other had only one of his toes broken. While at this island, we buried three more of our hands, among whom was George Lewis, our quarter-master, a diligent, sober man, and exceeding useful, as he spoke both the Spanish and Portuguese languages. On Sunday the 20th, at six o'clock, A. M. we made sail, and from this time to the 24th, many of our people began to complain of an intermitting disorder something like an ague.

A. D. 1768. On Friday the 1st of January, not less than 40 of our crew were down upon the sick list, laid up with fluxes and fevers of the putrid kind, diseases especially fatal on board a ship. The surgeon's mate was of this number; and even those who were appointed to attend the sick, were always taken ill in a day or two after they had been upon that service. The attention which our commander paid to the sick does him honour. He caused a commodious birth to be made for them, which he ordered to be hung with painted canvass, keeping it always clean, and directing it to be washed with vinegar, and fumigated once or twice a day: the water, though well tasted, was constantly ventilated: a large piece of iron was also heated red hot, and quenched in it, before it was given out to be drank: the sick had also wine instead of grog, and salop, or sago, every morning for breakfast: two days in a week they had mutton broth: sometimes a fowl or two on the intermediate days: besides all which restoratives and nourishment, they had plenty of rice and sugar, and frequently malt mashed for them. We believe people in a sickly ship had never so many refreshments before. Nor was the surgeon less assiduous in discharging, with unremitted attention, the duties of his office; yet, notwithstanding all these advantages, sickness gained ground from the malignant and contagious nature of the fevers with which the men were seized. To augment these our afflictions, the ship grew very leaky, her upper works were loose, and

she made more than three feet water in a watch. However, through the divine blessing upon human means, by the 10th, the sickness began to abate, but more than half the crew were so feeble, that they could scarcely crawl about. This day we saw many tropic birds about the ship, and on the 17th, we observed several albatrosses, and caught some bonettas. On the 24th, in latitude 33 deg. 40 min. south, longitude 328 deg. 17 min. west, we encountered a violent storm, which tore the main-top-sail to pieces. A dreadful sea broke over the ship, by which the starboard rudder-chain was demolished, and several of the booms were washed overboard; yet during the storm we observed a number of birds; and after it subsided all hands were employed in drying the bedding, and in repairing our shattered sails. On the 27th, we were by observation in latitude 34 deg. 16 min. and in longitude 323 deg. 30 min. west, and on the 30th, at six o'clock in the evening, we saw land.

February the 4th, being Thursday, we arrived at the Cape of Good Hope, and came to an anchor in Table Bay: in the run to which place from Prince's Island, the Dolphin had got 3 deg. to the eastward of her reckoning. We found riding in the bay a Dutch commodore, with 16 sail of Dutch East Indiamen, a French East India ship, and the Admiral Watson, Captain Griffin, an East India packet-boat for Bengal. The Captain having sent the usual compliments to the governor, he received our officer with great civility, assuring him, that we were welcome to all such refreshments and assistance that the cape afforded, and that he would return our salute with the same number of guns. We therefore saluted the governor with 13 guns, and he returned the full compliment. Admiral Watson saluted us with eleven guns, and we returned nine: the Frenchman saluted us with nine guns, and we returned seven. We now lost no time in procuring fresh meat and vegetables for the use of the sick. The surgeon was sent on shore to hire lodgings for them; but as the rate demanded was two shillings a day, and as the small-pox, (which many of our crew had not had) raged furiously in almost every house in Cape Town, Captain Wallis obtained permission of the governor, to erect tents on a spacious plain called Green point, about two miles distant from the town, where the invalids were sent during the day, and every evening returned to the ship. At the same time positive orders were given, that no liquors should be sent to the ship, or the tents; that no one should be permitted to go into the town; and that extra provisions should be procured for those who were most reduced by sickness. Much relief was found the very first day of their being on shore; on their return in the evening, at six o'clock, they seemed to be greatly refreshed; and a general recovery rapidly took place. Captain Wallis being himself extremely ill, was put on shore, and carried eight miles up the country, where he continued the whole time that the ship remained here, and when she was ready for sea, he returned on board, but without having received the least benefit. Every man who was able to do any kind of duty, was now employed in the necessary repairs of the ship; the sails were all unbent, the yards and top-masts struck, the forge was set up, the carpenters were engaged in caulking, the sail-makers in mending the sails, the cooper in repairing the casks, the people in overhauling the rigging, and the boats in filling the water. The heavy work being nearly done by Wednesday the 10th, several of the men, who had been seized with the small-pox, were permitted to visit the town; and those who had not been touched with that malignant distemper, were allowed to take daily walks in the country; and as they did not abuse this liberty, it was continued to them as long as the ship remained at the cape. At this place, the necessaries that could not be bought of the Dutch at Batavia, were purchased reasonably; and fresh water was procured by distillation, with a view of convincing the Dutch, how easily water might be procured at sea. Nothing can be more strongly contrasted, than the

conduct of the Dutch at Batavia, and at the Cape. The Asiatic Dutch can scarcely be induced to render the common offices of humanity to such of their species who resort to them to be saved from the jaws of death, and their rapacity knows no bounds: the African Dutch are disposed to administer every comfort to those who want relief, and in doing this no extortion is practised. The principle upon which the people at each settlement act is easily to be traced: at the first place, they suspect every foreign European ship which enters their port as endangering a secure possession of the most valuable branch of their commerce; in the latter, the wealth of the inhabitants, as well as the emoluments of government, are derived from the offices of humanity which they discharge. This day, at five o'clock, A. M. we put 56 gallons of salt-water into the still; at seven it began to run, and, in little more than five hours, afforded us 42 gallons of fresh water, at an expence of nine pounds of wood, and 69 pounds of coals. What we drew off had no ill taste, nor, as we had often experienced, any hurtful quality. Captain Wallis never once put the ship's company to an allowance of water, during the whole voyage, always using the still, when we were reduced to 45 tons, and preserving the rain water with the utmost diligence; nor would he permit water to be fetched away at pleasure; but the officer of the watch had orders to serve out a sufficient quantity to those who might want it for tea, coffee, grog, and provisions of any kind. On Thursday the 26th, we had nearly got on board all our wood and water; all our hands, and the tents were brought off from the shore; and, upon a general muster, we had the happiness to find, that in our whole company, three only were incapable of doing duty, and that we had lost only the same number, since our departure from Batavia, by sickness. This day the Captain came on board; and on the 27th and 28th, after having stowed all our bread, a considerable quantity of straw, and above 30 sheep for sea stores, we unmoored, and lay waiting for a favourable wind.

On Thursday the 3rd of March, we got under sail. From many observations we had an opportunity of making at Green Point, we determined Table Bay to lie in latitude 34 deg. 2 min. south, and in 18 deg. 8 min. east longitude from Greenwich. On the 7th, we were in latitude 29 deg. 33 min. south, longitude 347 deg. 38 min. from London. On Saturday the 13th, we found a day had been lost by having sailed westward 360 deg. from the meridian of London; we therefore called the latter part of this day, Monday the 14th of March. On Wednesday the 16th, at six o'clock, P. M. we came in sight of the island of St. Helena, distant 14 leagues; and on the 17th, at nine o'clock, A. M. we cast anchor in the Bay. We found riding here the Northumberland Indiaman, Captain Milford, who saluted us with 11 guns, and we returned nine. All our boats being hoisted out as soon as possible, we sent one party to fill our empty casks with water, and others to gather purslain, of which there is great plenty. The Captain going on shore was saluted with 13 guns from the fort, which compliment we returned. The governor and principal gentlemen of the island met him upon landing; and having conducted him to the fort, requested that he would make that place his residence, during his stay; but our water being completed, and the ship made ready for sea, on the 18th, Captain Wallis returned on board; upon which we unmoored, at five o'clock, P. M. got under way, and set sail for our native country, happy old England. On Wednesday the 23rd, at five o'clock, A. M. we had in view the island of Ascension; and at eight a sail was seen to the eastward, which brought to, and hoisted a jack at her

main-top-mast head; but we had no sooner shewed our colours than she went about, and stood in for the land again. Passing by the N. E. side of the island, we looked into the bay, but seeing no vessel there, and a blowing a stiff gale, we held on our course. On Monday the 28th, we crossed, for the fourth time, the equinoctial line, getting again into north latitude.

On Wednesday the 13th of April, we passed a great quantity of gulph weed, and on Tuesday the 19th, perceiving the water to be discoloured, we sounded, but could find no bottom. On the 24th, at five o'clock, A. M. we came in sight of Cape Pico, bearing N. N. E. distant 18 leagues; and at noon, by observation, we found Fyal to lie in latitude 38 deg. 20 min. north, and in 28 deg. 30 min. west longitude from London.

On Wednesday the 11th of May, we saw the *Savage* Sloop of war Captain Hammond, in chase of a sloop, at which he fired several guns. On this we also fired, and brought her to. She belonged to Liverpool, was called the *Jenny*, and commanded by Robert Christian. Captain Hammond informed us, that when he first saw her, she was in company with an Irish wherry, and that as soon as they discovered him, they took different ways: the wherry hauled the wind, and the *Jenny* bore away. At first he stood after the wherry, but finding he gained no ground, he bore away after the *Jenny*, who probably would likewise have outailed him, and escaped, had we not brought her to. She was laden with tea, brandy and other goods, from Roscoe in France. Her brandy and tea were in small kegs and bags. Captain Wallis detained her, in order to her being sent to England, as from all appearances, which were strongly against her, we judged miss *Jenny* to be a smuggler; for though sailing a S. W. course, she pretended to be bound to Bergen in Norway. On the 13th, at five o'clock, A. M. the islands of Scilly appeared; and on Thursday the 19th, Captain Wallis landed at Hastings in Sussex. On the following day this voyage was happily completed, and the circumnavigation of the globe successfully accomplished; for on Friday the 20th, the *Dolphin* came to an anchor in the Downs, having been 637 days from the time that she took her departure from Plymouth Sound. As the main end proposed by this arduous and hazardous undertaking was to make discoveries, Captain Wallis, when navigating those parts of the South Sea, which were imperfectly known, that nothing might escape him, constantly laid to every night, and made sail only in the day; notwithstanding which considerable delay in sailing, he accomplished his voyage a month and a day sooner than his predecessor had done in the same circumnavigation. The ill health which the Captain complains of almost through the voyage, may serve as a sufficient apology for the want of a more copious information in his narrative; concerning the places which he visited, particularly Ocaheite, the Indian name of which he does not mention. In the relations of this commander, we see little of that watchful attention, curiosity, and ardent desire, to "catch the manners living as they rise," which were possessed by Captain Carteret, and which appear so eminently conspicuous in Captain Cook, wherever he is, and in whatever manner he is engaged; yet in justice to the respectable character of Captain Wallis, we must observe, that he constantly and indefatigably pursued the grand object of his voyage; and if we consider his nautical abilities, his amiable philanthropy, apparent in his conduct and behaviour to those under his command, together with his judicious observations as a mariner, at the several ports, and the various situations of the *Dolphin* at sea, we cannot but think he is deservedly worthy of being placed in the first rank of our able and skillful circumnavigators.

A NEW, AUTHENTIC, REMARKABLE, and ENTERTAINING
HISTORY and NARRATIVE, of
A VOYAGE Round the WORLD;

UNDERTAKEN and PERFORMED,

By that NEGLECTED and GALLANT OFFICER,
Capt. PHILIP CARTERET, Esq.
In his MAJESTY's Sloop the SWALLOW;

During the Years 1766, 1767, 1768, and 1769.

CONTAINING,

A lively description of the generous nature of Captain Carteret; the inattention which was shewn to his fitting out; and his scanty supply of necessaries; together with an affecting and complete account of the perilous situation of the Swallow, on the western extremity of the Magellanic Straits; who, notwithstanding her bad sailing, dangerous situations, and shattered condition, without any marks of despondency from her company, continued her voyage, after her separation from the Dolphin, and accomplished the circumnavigation of the Globe; having set sail from Plymouth Sound August the 22nd, 1766—Parted from her consort, the Dolphin, on the 11th of April, 1767—and anchored at Spithead on the 20th of March 1769—The whole being drawn up from authentic journals and private papers, and illustrated with a rich variety of communications from Captain JOHN HOGG, late of the Royal Navy.

INTRODUCTION.

CAPTAIN Philip Carteret, the history of whose voyage round the world we are about writing, had failed with Commodore Byron on his expedition, and soon after his return, was appointed to the command of the Swallow Sloop, destined to accompany the Dolphin, and Prince Frederick Store-ship. The Captain having received his commission, bearing date July the 1st, 1766, was ordered to fit out the Swallow, which then lay at Chatham, with all possible expedition. This gallant officer describes emphatically, and in a most feeling manner, like his predecessor, Commodore Anson, the inattention which was shewn to his fitting out. It had been hinted to him, that he was to go out in the Dolphin, but the amazing disparity of the two ships, and the distinguished superiority in the equipment of one to the other, induced him to conclude, that they could not be intended for the same duty; for whilst the Dolphin was furnished with every thing requisite for a long and dangerous navigation, the neglected Swallow Sloop had only a scanty supply of necessaries. Besides, she was an old vessel, having been built 30 years, and was by no means fit for a long voyage. Upon her bottom was only a slight thin sheathing, which was not even filled with nails to supply the want of a covering, that would more effectually keep out the worm. Captain Carteret observing the Swallow to be totally unprovided with many things, which particular situations might render absolutely necessary for her preservation, applied for a forge, some iron, a small skiff, and several other things; not one of which articles he could obtain;

but was told, that the vessel and her equipment were very fit for the service she was to perform; though, at the same time, she had not a single trinket or toy put on board her, to enable her commander to procure refreshments from the Indians of the Southern Hemisphere. Add to all this, there was a deficiency of junk on board, an article essentially necessary in every voyage; and when application was made for this at Plymouth, the Captain was told, that a sufficient quantity was put on board the Dolphin. Thus circumstanced, it cannot be even supposed, that a commander of Captain Carteret's discernment, would think of being a consort with the Dolphin in her hazardous expedition; and we cannot but credit the declaration of this brave officer, when he tells us, he was therefore confirmed in his opinion, that if the Dolphin was to go round the world, it could never be intended that the Swallow should go farther than Falkland's Islands, where the Jason, a fine frigate, which was, like the Dolphin sheathed with copper, and amply equipped, would, in the Captain's opinion, supply her place. Nothing can place a commander of seamen in a more respectable point of view, than his appearing to possess equanimity and fortitude under the most disheartening circumstances. Numerous and great as these were, Captain Carteret resolved to serve his country in the line of his profession; and therefore proceeded to Plymouth Sound with the Swallow, in company with the Dolphin, under the command of Captain Wallis, and the Prince Frederick Store-ship, commanded by Lieutenant James Brine.

Brine. While the Swallow lay at this place, not being yet acquainted with his destination, Captain Carteret represented to Captain Wallis his being in want of junk, who sent him 500 weight, a quantity so small and in-

sufficient, that we were soon reduced to the disagreeable necessity of cutting off some of the cables to save our rigging.

CHAPTER I.

The Swallow sails in company with the Dolphin, and Frederick Store-ship, from Plymouth Sound, Friday the 22nd of August, 1766—Passage from thence to the Island of Madeira—Proceeds on her voyage to the Straits of Magellan—And anchors off Cape Virgin Mary—The bad condition of the Swallow in her navigation through the Straits—With great difficulty reaches Port Famine—Is obliged to continue her voyage, after her commander had requested of Captain Wallis to alter her destination—On the 11th of April, 1767, is separated from her consort, the Dolphin, without the least hope of seeing her during the remainder of the voyage—The gallant behaviour of Captain Carteret in this alarming situation—The run of the Swallow from the western entrance of the Strait of Magellan to the island of Masafuco—Incidents and transactions whilst the ship lay off this island—Observations—She departs from Masafuco and makes Queen Charlotte's Islands—A description of these and their inhabitants—An obstinate skirmish with the natives of Egmont Island described, with an account of their country, canoes, and weapons.

A. D. 1766. **O**N Thursday the 21st of August, our ship's company on board the Swallow received two months pay; and the next day, Friday the 22nd, we weighed and made sail, with the Dolphin and Frederick store-ship. We proceeded together without any material occurrence, till the 7th of September, when we came to an anchor in the road of Madeira. On Tuesday the 9th, nine of our prime seamen left the ship secretly, and swam on shore naked. They left behind them all their clothes; and took only their money, which they had secured in handkerchiefs that were tied round their waists. They proceeded together till they came very near the surf, when one of them, somewhat terrified at the dashing waves, which here break very high on the shore, returned to the Swallow, and was taken on board, but the rest boldly pushed through. While Captain Carteret was writing to the consul, entreating his assistance to recover those brave but imprudent fellows, whose loss would have been severely felt, he received a message, by which he was informed, that they had been found by the natives naked on shore; that they had been taken into custody, but would be delivered up to his order. A boat was instantly dispatched to bring them on board, where they cut a most ridiculous figure, and seemed heartily ashamed of what they had done. When our noble Captain came upon deck, he appeared pleased at seeing the marks of contrition in their countenances, and asked in the mild tone of humanity, what could be their reasons and motives for quitting the ship, and deserting the service of their country, at the risk of being devoured by sharks, or dashed to pieces by the surf against the shore. To this they replied, that though they had indeed, at such risks, ventured to swim on shore, yet they had never entertained a thought of deserting the ship, which they were determined to stand by as long as she could swim; but that being well assured they were going a long voyage, and none being able to tell who might live or who might die, they thought it hard to be deprived of an opportunity of spending their own money, and therefore resolved once more to get a skinful of liquor, and then to have swam back to the ship, which they expected to have done before they were missed. The Captain having determined secretly not to inflict the punishment by which they seemed most heartily willing to expiate their fault, did not scrutinize severely their apology, observing only, that with a skinful of liquor they would have been in a very unfit condition to swim through the surf to the ship; and, hoping they would expose their lives only upon more important occasions, and that he should in future have no cause to complain of their conduct, upon these conditions, he would for this time be satisfied with that shame and regret, which he perceived plainly imprinted on their countenances, and which indicated a proper sense of their misbehaviour; at the same time, he advised them to put on their clothes and turn in,

being confident they wanted rest; adding, that as good swimmers might probably be wanted in the course of our voyage, he was very glad that he knew to whom he might apply. Captain Carteret endeared himself very much to these men by this act of tenderness, and he had scarcely dismissed them when he was infinitely gratified by the murmur of satisfaction which instantly ran through the ship's company; and the future conduct of the offenders amply repaid his well timed lenity, there being no service, during all the toils and dangers of the voyage, which they did not perform, with a zeal and alacrity that were much to their honour, and our advantage, as an example to the rest.

Friday the 12th of September, we sailed out of the road of Madeira; and were now convinced, we were sent upon a service, to which the Swallow and her equipment were by no means equal; for this day our commander received from Captain Wallis a copy of his instructions, who also appointed, in case of a separation, Port Famine, in the Strait of Magellan, to be the place of rendezvous. We continued our voyage, without any material incident, till we reached Cape Virgin Mary, where we saw the Patagonians, a full account of whom has been given in our history of the two expeditions performed by Commodore Byron and Captain Wallis, in their circuit round the world; and as the particulars in the narrative before us are the same, it will be needless to recite them. With much labour, and at no inconsiderable risk, (for we could but seldom make the Swallow tack, without a boat to tow her round) we anchored in Port Famine, on the 28th of December; where we unhung our rudder, and having made it somewhat broader, we hoped to obtain an advantage in working the ship, but in this particular we were entirely disappointed.

A. D. 1767. **O**N Tuesday the 17th of February, after having encountered many difficulties and dangers, we steered into Island Bay; and at this place our commander, in a letter to Captain Wallis, set forth in affecting language, the ill condition of the Swallow, requesting of him to consider what was best for the king's service, whether she should be dismissed, or continue the voyage; to which Captain Wallis returned for answer, that as the Lords of the Admiralty had ordered the Swallow on this service, in conjunction with the Dolphin, he did not think himself at liberty to alter the destination of the former. In consequence of this reply, founded only on the single opinion of Captain Wallis, we continued to navigate the strait in company with the Dolphin; and as our Captain had passed it before, we were ordered to keep a-head and to lead the way, with liberty to anchor and weigh when and where we thought proper; "but (to use Captain Carteret's own words) perceiving, says he, that the bad sailing of the Swallow would so much retard the Dolphin, as probably to make her lose the season for getting into

into high southern latitudes, and defeat the intention of the voyage, I proposed to Captain Wallis, that he should lay the *Swallow* up in some cove or bay, and that I should attend and assist him with her boats till the strait should be passed, which would probably be in much less time than if he continued to be retarded by my ship; and I urged as an additional advantage that he might complete not only his stock of provisions and stores, but his company out of her, and then send her back to England, with such of his crew as sickness had rendered unfit for the voyage; proposing also, that in my way home, I would examine the eastern coast of Patagonia, or attempt such discoveries as he should think proper. If this was not approved, and my knowledge of the South Seas was thought necessary to the success of the voyage, I offered to go with him on board the *Dolphin*, and give up the *Swallow* to be commanded by his first lieutenant, whose duty I would perform during the rest of the voyage, or to make the voyage myself in the *Dolphin*, if he would take the *Swallow* back to England: but Captain Wallis was still of opinion, "that the voyage should be prosecuted by the two ships jointly, pursuant to the orders that had been given;" but he assured Captain Carteret, at the same time, that, "in consideration of the very dangerous condition of the *Swallow*, the *Dolphin* should continue to keep company with her as long as it was possible, waiting her time, and attending her motions." The generous nature of Captain Carteret our readers will infer, from his not availing himself of this assurance, when stating the conduct of his superior officer in so trying an instance. By this time the *Swallow* was become so foul, that with all the sails she could set, it was not in her power to make so much way as the *Dolphin*, not even when the latter had only her top-sails and a reef in them: however, under these trying circumstances, we continued with our companion till the 10th of April, on which day the western entrance of the strait was open, and the great South Sea in sight. We had hitherto, agreeable to orders, kept a-head, but now, the *Dolphin* being nearly abreast of us, she set her fore-sail, which soon carried her a-head of us, and by nine o'clock in the evening she was out of sight, for when the day closed she shewed no lights. A fine eastern breeze blew at this time, of which, during the night, we made every possible use, by carrying all our small sails, even to the top-gallant fludding-sails, by which we were exposed to great danger.

On Saturday the 11th, notwithstanding every means had been used to come up with the fugitive, yet such was the disparity of sailing between the two ships, that, at day-break, the top-sails of the *Dolphin* could only be seen above the horizon; but we could perceive she had fludding-sails set; and at nine o'clock we entirely lost sight of her, judging she might be then clear of the straits mouth. The *Swallow* was now under the land; and in this bad sailing, ill provided ship, having neither a forge, nor a single trinket on board, was our neglected, but gallant officer, destined to proceed over the vast expanse of the great Southern Ocean; yet amidst all these discouraging circumstances, no signs of despondency were visible among our people, whom the Captain encouraged by telling them, that though the *Dolphin* was the best ship, he did not doubt but he should find more than equivalent advantages in their courage, ability, and good conduct. Such an ascendancy over his seamen, is a plain proof, how much they revered, confided in, and loved him. From this day, we gave up all hope of seeing our consort again till we should arrive in England, no plan of operation having been settled, nor any place of rendezvous appointed, as had been done from England to the strait. At noon, when abreast of Cape Pillar, a strong gale from S. W. obliged us to take down our small sails, and haul close to the wind; soon after which we had the mortification to find, that when we had made two boards, we could not weather the land on either tack. The gale increased, driving before it a hollow swell, and a fog came on, with violent rain, which compelled us to get close

under the four-shore. We now sent out our boat in search of Tuesday's Bay, which is said by Sir John Narborough to lie about four leagues within the strait, or to find out any other good anchorage. At five o'clock, P. M. we could not see the land, notwithstanding its mountainous height, though within half a mile of it; and, at six, it was so dark that we could not see half the ship's length. Being concerned for the safety of our boat, we put out lights, made false fires, and fired a gun every half hour; and at last she reached the ship, but had made no discovery either of Tuesday's Bay, or any other anchoring place. During the remainder of the night we made sail, endeavouring to keep near the south shore. The next day, being the 12th, as soon as it was light, the boat was sent out again to explore the south shore for an anchoring place; and at five o'clock, P. M. when we almost despaired of her returning in time, saw her sounding a bay, and stood in after her. The master said, that we might here safely cast anchor, which we did about six o'clock, and then the Captain retired to take some rest. In a few minutes after, he was disturbed by a universal shout and tumult among the people upon deck, and the noise of those below running to join them. When Captain Carteret came upon deck, the general cry was, the *Dolphin*! the *Dolphin*! in a transport of surprize and joy: but this delusive appearance soon vanished, and proved to be only water forced up, and whirled in the air by a gust of wind. The people were for a few minutes dejected by their disappointment, but before the Captain went down, he had the pleasure to see a return of their usual fortitude and cheerfulness. The little bay where we now lay, is about three leagues E. by S. from Cape Pillar, and bears S. by E. four leagues from the island which Sir John Narborough called Westminster Hall. The western point of this bay has a resemblance to a perpendicular oblong square, like the wall of a house; within its entrance are three islands, and within these a very good harbour, with anchorage in between 25 and 30 fathoms, bottom soft mud. We anchored without the islands, the passage on each side of them being not more than a cable's length wide. Our small cove is about two cables length broad; and in the inner part is from 16 to 18 fathoms, but where we lay it is deeper. The landing is every where good; with plenty of wood, water, muscles, and wild geese. As a current sets continually into it, our Captain is of opinion, that it has another communication with the sea to the south of Cape Descada. Our master reported, that he went up it four miles in a boat, and could not then be above four miles from the western ocean, yet he still saw a wide entrance to the S. W. Here we rode out a very hard gale of wind, and, the ground being very uneven, we expected our cables to be cut in two every minute, yet when we weighed, to our great surprize, they did not appear to have been rubbed in any part, though we found it very difficult to heave them clear of the rocks. From the north shore of the western end of the strait of Magellan, the land, which is the western coast of Patagonia, runs nearly N. and S. being a group of broken islands, among which are those laid down by Sharp, by the name of the Duke of York's Islands. They are indeed placed by him at a considerable distance from the coast, but if there had been many islands in that situation, the *Dolphin*, the *Tamar*, or the *Swallow*, must have seen them. Till we came into this latitude, we had tolerable weather, and little or no current in any direction, but when northward of 48 deg. we had a current setting strongly to the north, so that probably we then opened the great bay, which is said to be 90 leagues deep. Here we found a prodigious swell from the N. W. and the winds generally blew from the same quarter.

On Wednesday the 15th, we once more got again abreast of Cape Pillar; but between five and six o'clock, A. M. just as we opened Cape Descada, the wind suddenly shifting, and its excessive violence, produced a sea so dreadfully hollow, that we were in the utmost danger of sinking; yet we could not shorten sail, it being neces-

fary to carry all we could spread, for fear of running foul of some rocky islands, which, in Narborough's voyage, are called the islands of Direction; nor could we now go back into the strait, without the danger of running foul of a lee-shore, towards which the ship settled very fast, notwithstanding our utmost efforts. Thus circumstanced, we were obliged to stave the water-casks on and between the decks, in order that she might carry better sail, and by this expedient we escaped the threatened destruction. We now got into the open sea, after a very providential deliverance, for had the wind again shifted, the Swallow must have been unavoidably lost. Having got clear of the Strait of Magellan, we steered to the northward along the coast of Chili, intending to make the island of Juan Fernandes, or Mafafuero, that we might increase our stock of water, which at this time amounted only to between four and five and twenty tons, a quantity not sufficient for so long a voyage as was probably before us. On the 16th, the wind, which had hitherto been favourable, on a sudden shifted, and continued contrary till Saturday the 18th. We had now sailed nearly 100 leagues from the straits mouth when our latitude was 48 deg. 39 min. south, and our longitude, by account, 4 deg. 33 min. west from Cape Pillar. From this time to the 8th of May, the wind continued unfavourable, and blew an incessant storm, with sudden gusts still more violent, accompanied at intervals, with dreadful thunder, lightning, rain, and hail. In our passage along this coast we saw abundance of sea birds; among which were two sorts, one like a pigeon, of a dark brown colour, called by seamen the Cape of Good Hope hen, and sometimes the black gull; the other pintado birds, which are prettily spotted with black and white, and constantly on the wing; but they appear frequently as if walking on the water, like the petrels; and these our sailors call Mother Carey's Chickens. During nine days we experienced an uninterrupted course of dangers, fatigues and misfortunes. The Swallow worked and sailed very ill, the weather was dark and tempestuous; and the boats, which the exigencies of the ship kept constantly employed, were in continual danger of being lost, as well by the gales which blew constantly, as by the sudden gusts which rushed frequently upon us, with a violence that can scarcely be conceived: those off the land were so boisterous, that not daring to shew any canvass, the ship lay to under her bare poles, and the water at times was torn up, and whirled round in the air, much higher than the masts heads. This distress was the more severe, by its being unexpected; for Captain Carteret had experienced very different weather in those parts, when he accompanied Commodore Byron: it was then the latter end of April when he was near this coast, so that this change of climate could not be owing to a change of season. On Friday the 1st of May, the wind shifted from the N. W. to the S. W. and brought the ship up with her head right against the vast sea, which the N. W. wind had raised; for about an hour it blew, if possible, stronger than ever; and at every pitch the Swallow made, the end of her bowsprit was under water, and the surge broke over the fore-castle as far aft as the main mast, in the same manner as it would have broke over a rock, so that there was the greatest reason to apprehend she would founder. With all her defects we must acknowledge she was a good sea boat; if she had not been so, it would have been impossible for her to have outlived this storm, in which, as on several other occasions, we experienced the benefit of the bulk-heads, which we had fixed on the fore-part of the half deck, and to the after part of the fore-castle. On the 3rd, at day-break we found the rudder chain broken, which made us, as we had often done, most feelingly regret the want of a forge. However we made the best shift we could; and on the 4th, the weather being more moderate, we mended the sails that had been split, and repaired our rigging. On the 5th, a hurricane from the N. by W. and N. N. W. brought us again under our courses, and the ship was tossed about with such violence that

we had no command of her. In this storm two of our chain-plates were broken, and we continued toiling in a confused hollow sea till midnight. On the 6th, at two o'clock, A. M. we were taken right a-head by a furious squall at west, which was very near carrying all by the board, before we could get the ship round. With this gale we stood north, and the carpenters, in the forenoon, fixed new chain-plates in the place of those which had been broken; and on this occasion we could not refrain from again lamenting the want of a forge and iron. We held on our course till the 7th, when, at eight o'clock, A. M. the wind returned to its old quarter, the N. W. attended with unsettled weather.

On Friday the 8th, the wind having come to the south, we were favoured with a fine day, being the first we had seen since we took our departure from the Straits of Magellan. At noon we observed in latitude 38 deg. 39 min. south, and were about 5 deg. to the westward of Cape Pillar. On the 9th, we were in sight of the island of Mafafuero; and on the 10th, made that of Juan Fernandes. In the afternoon, we sailed round the north end of it, and opened Cumberland Bay. We were surprized, not knowing that the Spaniards had fortified this island, to see a considerable number of men about the beach, also a house and four pieces of cannon near the water side; and upon the side of the hill, about 300 yards farther from the sea, a fort with Spanish colours flying. We saw scattered round it, and on different parts of the island, more than 30 houses, and much cattle feeding on the brow of the hills, which seemed to be cultivated, many spots being divided by enclosures from the rest. We saw also two large boats lying on the beach. The fort, which is faced with stone, has 18 or 20 embrasures, and within it a long house, which we supposed to be barracks for the garrison. The wind blew in such violent gusts out of the bay, as to prevent our getting very near it; and, in the Captain's opinion, it is impossible to work a ship into this bay, when the wind blows hard from the south. We now stood to the westward, and were followed by one of the boats, which put off from the shore, and rowed towards us; but the soon returned, on observing that the heavy squalls made us lie at a considerable distance from the land. Having opened west-bay, we observed on the east part, what we took for a guard-house, and two pieces of cannon on carriages near it. We now wore, and stood again for Cumberland Bay, and the boat again put off towards us, but night coming on, we lost sight of her. As we had only English colours on board we hoisted none, as we could not suppose the Spaniards well disposed to receive English visitants. Thus disappointed of the refreshments, of which we stood in the most pressing need, our Captain thought it more advisable to proceed to the neighbouring island of Mafafuero, where we arrived on Tuesday the 12th, and on Friday the 15th, chose our station on the eastern side, anchoring in the same place where Commodore Byron lay in the Dolphin, about two years before. On the 16th, we were driven from our moorings and kept out at sea all night. In the morning the cutter was sent for water, and the ship got near the shore, where she soon received several casks, and dispatched the cutter back for more. The long boat was likewise appointed to this service, as well as to carry provisions to those on shore. In the afternoon the boats being observed running along the shore, the ship followed and took them in, but not without their sustaining so much damage by the violence of the sea, that the carpenters were obliged to work all night in repairing them.

On Sunday the 17th, the lieutenant, Mr. Erasmus Gower, was sent again with the cutter to procure water, and the surf being very great, three of the seamen swam on shore with the empty casks, in order to fill them, and bring them back to the boat; but the surf soon after rose so high, and broke with such fury on the shore, as rendered it utterly impracticable for them to return. A very dark and tempestuous night succeeded; the poor fellows were stark naked, and cut off from

A View of the N.W. Side of MAS-A-PUEA

all means of procuring assistance from the boat, which, to escape the fury of a gathering storm, was obliged to return to the ship, into which it was safely received but the minute before the impending storm rushed forth, by which, had she been upon the water, she must have been inevitably sunk, and every soul on board perished. The three naked, defenceless mariners on shore, during the night, were doomed to "bide the pelting of the pitiless storm," without clothes, without shelter, without food, and without fire. To augment their distress, a party was then on shore, and had erected a tent; but the darkness of the night, and the impenetrable thickness of the woods, cut off all possibility of receiving succour from them. Being thus reduced to an entire state of nature, without the habits which render that state supportable, in order to preserve a living portion of animal heat, they lay one upon another, each man alternately placing himself between the other two. At the first dawn of light, they made their way along the shore, in search of the tent; an attempt to penetrate through the country being considered as fruitless. In this circuit they were frequently stopped by high, steep, bluff points, which they were obliged to swim round at a considerable distance; for, if they had not taken a sufficient compass, they would have been dashed to pieces against the rocks, in avoiding which they were every moment in danger of being devoured by sharks. About ten o'clock in the morning they joined their comrades, being almost perished with hunger and cold. They were received with the most cordial welcome, their shipmates sharing with them their cloaths and provisions; and it is hard to say of which they stood most in need. On the 18th, they were brought on board the ship, where the Captain gave orders, that they should have all proper refreshments, and remain in their hammocks the whole night; and the next day we had the pleasure to find they were perfectly hearty, nor did they suffer any future inconvenience from the extreme hardships they had gone through. These men were three of the nine honest fellows, who had swam naked from the ship, when the lay in the road of Madeira, to get a skinful of liquor. Than which nothing could paint more strongly the general character of English sailors, which may perhaps be defined to consist in a contempt of danger, a love of strong liquor, and a girl, and an aversion to be possessed of any coin, when embarked on a long voyage. This day the weather was moderate, and in the evening we were within half a mile of the anchoring ground from whence we had been driven; but the wind suddenly failing, and a current making against us, we could not reach it. During the whole night we had a perfect calm, so that in the morning of the 19th, we found the current and the swell had driven us no less than nine miles from the land; but a breeze springing up, we kept off and on near the shore, and in the interim sent the cutter for water, who as she rowed along shore caught as much fish with hook and line as served all the ship's company, which was some alleviation of our disappointment.

On Wednesday the 20th, we happily regained our station, and came again to an anchor, at two cables length from the beach, in 18 fathoms water, and moored with a small anchor in shore. We now sent out the long boat, who in a short time procured fish enough to supply all our company on board. The two following days we had exceeding bad weather. In the morning of the 21st, the wind blew with such violence along shore, that we frequently drove, though we had not less than 200 fathoms of cable out: however we rode out the storm without damage, but the rain was so violent, and the sea ran so high, that nothing could be done with the boats, which was the more mortifying, as it was for the sake of completing our water, that we had endured almost incessant labour, for five days and nights, to regain the situation in which we now lay. At a short interval, when the wind became more moderate, we sent three men ashore, abreast of the ship, to kill seals, and to make oil of their fat, for burning in the lamps, and other uses. On the 22nd, in the morning,

the wind blew very hard, as it had done all night, but, being off the land, we sent the boats away at day-break, and about ten o'clock they returned with each of them a load of water, and a great number of pintado birds, or peterels. These were obtained from the people on shore, who told them, that when a gale of wind happened in the night, these birds flew faster into the fire than they could well take them out; and that, during the gale of last night, they got no less than 700 of them. Throughout this day the boats were all employed in bringing water on board; but the surf was so great that several of the casks were staved and lost; however by the 23rd, a few only were wanted to complete our stock. The weather now grew so bad that the Captain was impatient to sail: he therefore gave orders for all our people on shore to come on board. At this time the Swallow again drove from her moorings, dragging the anchor after her, till she got into deep water. We now brought the anchor up, and lay under bare poles, waiting for the boats. In the evening the long boat with ten men were taken on board; but there yet remained the cutter with the lieutenant and 18 men; which brings to our recollection a very similar situation, in which those on board the Centurion, under Commodore Anson, were thrown off the island of Tinian. The weather becoming more moderate about midnight, the Swallow stood in for land; and on the 24th, at ten o'clock, A. M. we were very near the shore, but the cutter was not to be seen; about noon, however, she was happily discovered close under land, and in three hours time we took her crew on board. The Lieutenant reported, that the night before he had attempted to come off, but that he had scarcely cleared the shore, when a sudden gust of wind almost filled the boat with water, which narrowly escaped filling: that, all hands bailing with the utmost activity, they fortunately cleared her; that he then made for the land again, which with great difficulty he regained, and having left a sufficient number of men with the boat, to watch, and keep her free from water, he, with the rest of the people went on shore. That, having passed the night in a state of inexpressible anxiety and distress, they looked out for the ship with the first dawn of day, and seeing nothing of her, concluded that she had foundered in the storm, which they had never seen exceeded. They did not however give way to gloomy reflections, nor sit down in torpid despair, but began immediately to clear the ground near the beach of bushes and weeds, and to cut down several trees, of which they made rollers to assist them in hauling up the boat on land, in order to secure her, intending, as they had no hope of the ship's return, to wait till the summer season, and then attempt to make the island of Juan Fernandes: but these thoughts were lost in their happy deliverance. Having thus once more got our people and boats safe on board, we made sail from this turbulent climate; and thought ourselves fortunate not to have left any thing behind except the wood, which had been cut for firing.

It is a common opinion, that upon this coast the winds are constantly from the south to the S. W. though Frazier mentions his having had strong gales and high seas from the N. N. W. and N. W. quarter, which was unhappily our case. The island of Masafuero, which lies in latitude 33 deg. 45 min. south, longitude 80 deg. 46 min. west from the meridian of London, is of a triangular form, about 23 miles in circumference; being west of Juan Fernandes; both of the islands are nearly in the same latitude. At a distance it has the appearance of a high, mountainous rock. The South part is much the highest, and on the north end are several clear spots, which perhaps might admit of cultivation. On the coast in many places is good anchorage, particularly on the west-side, at about a mile from the shore, in 20 fathoms, and at nearly three miles, in 40 and 45 fathoms, with a fine black sand at the bottom. The author of the account of Lord Anson's voyage mentions a reef of rocks, which he says, "runs off the eastern point of the island, about two miles

miles in length, which may be seen by the sea's breaking over them," but in this he is mistaken; though indeed there is a reef of rocks or shoal running off the western-side, near the south-end thereof. He is not less mistaken with respect to the distance of this island from Juan Fernandes, and its direction, for he makes the former 22 leagues, and the latter W. by S. but we found the distance one third more, and the direction is due west; for, as we have before observed, the latitude of both islands is nearly the same. On the S. W. part of the island there is a remarkable perforated rock, which is a good mark to come to an anchor on the western-side, and here is the best bank of any about the place. To the northward of the hole in the rock, distant about a mile and a half, is a low point of land; and from hence runs the above-mentioned reef, in the direction of W. by S. to the distance of about three quarters of a mile, where the sea continually breaks upon it. To come to anchor, you must run in till the hole in the rock is shut in, about a cable's length upon this low point of land, then bearing S. by E. half E. and you may anchor in 20 and 22 fathoms, fine black sand and shells. Anchorage may likewise be found on the other sides of the island, particularly off the north point, in 14 and 15 fathoms, with fine sand. Plenty of wood and water may be procured all round the island, but not without much labour and difficulty, by reason of a great quantity of stones, and large fragments of rocks, which have fallen down from the high land, and upon these such a violent surf breaks that a boat cannot approach safely within a cable's length of the shore; so that there is no landing here but by swimming from the boat, and then mooring her without the rocks; nor is there any method of getting off the wood and water, but by hauling them to the boat with ropes: but Captain Carteret observes, there are many places where it would be very easy to make a commodious landing by building a temporary wharf, which it would be worth while even for a single ship to do, if she was to continue any time at the island. Here we found the seals so numerous, that, says the Captain, I verily think, if many thousands of them were killed in the night, they would not be missed in the morning. These animals yielded excellent train oil, and their hearts and plucks are very good eating, being in taste something like those of a hog; and their skins are covered with the finest fur of the kind. In this island are many birds, among others vast numbers of pintadoes, and some very large hawks. While the tent was erected on shore, a king-fisher was caught, which weighed 87 pounds, and was five feet and a half long. Goats are to be found in great abundance, and may be easily caught. We had not an opportunity to botanize, or search after vegetable productions, but we saw several leaves of the mountain cabbage, which is a proof that the tree is a native of this place. The island is surrounded with abundance of fish, in such plenty, that a boat's crew, with three hooks and lines, may obtain as much in a short time as will serve 100 people: among others we caught cray-fish, cod, halibut, cavallics, and excellent coal-fish. The sharks were so ravenous, that when we were founding one of them swallowed the lead, by which we hauled him above water, but as he then disgorged it, we lost him. So much for this island of Malafuero, of which we have given several particular and full accounts in former parts of this work.

When we departed from hence, on Sunday the 24th of May, we failed to the north, hoping to fall in with the S. E. trade wind; but having run farther to the northward than was at first proposed, we looked out for the islands of St. Ambrose, and St. Felix, or St. Paul, which are laid down in Green's charts, published in the year 1753; but, as was supposed, we missed them by attending to the erroneous position which is ascribed to them in Robinfon's navigation, who has laid down the island of St. Ambrose in 25 deg. 30 min. south latitude, and in 82 deg. 20 min. west longitude; but we might perhaps go too far to the northward, for we saw great numbers of birds and fish, which are in-

dications of land not far distant. We continued steering between the latitude of 25 deg. 30 min. and 30 deg. in search of those islands, till we had proceeded 5 deg. to the westward of our departure; we then directed our course more to the southward, and found ourselves in the latitude of 27 deg. 20 min. In this parallel we had light airs and foul winds, with a strong northerly current, which led Captain Carteret to conjecture, that he was near the land which Roggewein visited in the year 1722, and called Eastern Land, and which some have supposed to be the same as a discovery before made by Davis, which in the charts is called Davis's Land; and in this conjecture concerning Eastern Land our commander has been found to be perfectly right, as Captain Cook happened to fall in with this spot in the year 1774; and by the position he alligns it, our navigator appears to have been not more than a degree to the southward of it. It was now, being June the 17th, the depth of winter, and we had hard gales with heavy seas that frequently brought us under our courses; and though we were near the tropic of capricorn, the weather was dark, hazy, and cold, with frequent thunder, lightning, sleet, and rain. The sun was above the horizon about ten hours in the four and twenty, but many days were frequently passed without seeing his face; and the weather was so thick, that when he was below it, the darkness was, inexpressibly horrible; and this dreadful gloom in the day deprived us for a considerable time of an opportunity to make an observation; notwithstanding which dangerous circumstance we were obliged to carry all the sail we could spread both day and night, as the ship making way so slowly, and the voyage being so long, we were exposed to the danger of perishing by famine.

On Thursday the 2nd of July, in the evening, we discovered land to the northward of us; which appeared like a great rock rising out of the sea. It is situated in latitude 25 deg. 2 min. south, and in 133 deg. 21 min. west longitude. It is an island well covered with trees, and down the side of it runs a stream of fresh water. The height of it is so immense, that we saw it at the distance of more than 15 leagues. We judged it to be not more than five miles in circumference, and we could perceive no signs of its being inhabited. The Captain was desirous of sending out a boat to attempt a landing, but the surf, which, at this season, broke upon it with great violence, rendered it impracticable. We saw a great number of sea birds at somewhat less than a mile from the shore, and the sea here seemed not destitute of fish. Having been discovered by a son of Major Pitcairn, we called it Pitcairn's Island. This young gentleman was afterwards lost in the Aurora, in her passage to the East Indies; and his father, major of the marines, fell in the action of Bunker's Hill, and died in the arms of another of his sons. While in the neighbourhood of this island, we seldom had a gale to the eastward, so that we were prevented from keeping in a high south latitude, and were continually driving to the northward. The winds chiefly blew from the S. S. W. and W. N. W. and the weather was extremely tempestuous, with long rolling billows from the southward, larger and higher than any we had seen before. On the 4th, the ship admitted a great quantity of water, and was otherwise in a very crazy condition, from the rough seas she had encountered. Our sails also, being much worn, were continually splitting; and our company who had hitherto enjoyed good health, began to be afflicted with the scurvy. When the ship lay in the Straits of Magellan, Captain Carteret had caused a small awning to be made, and covered it with a clean painted canvas, which he had for a floor-cloth in his cabin; and in this he caught so much rain water, at a very little expence of trouble and attendance, that the crew were never put to short allowance of this necessary article during the voyage. This method of obtaining rain water we have already particularly described, and is constantly practiced by the Spanish ships, which annually cross the South Sea from the Manilas to Acapulco, and in their return. The awning also afforded shelter

shelter from the inclemency of the weather. The surgeon likewise mixed a small quantity of spirits of vitriol with the water, which was thus preserved; and to these precautions the Captain imputes the escape which our men had so long had from the scurvy. On Saturday the 11th, in latitude 22 deg. south, and longitude 141 deg. west, another small, low, flat island was discovered, which we called the Bishop of Osnaburgh's Island, in honour of his present majesty's second son; and as Captain Wallis had given the same name to another island, that prince holds two honorary fiefs in the South Sea. This low piece of land, which appeared to be almost level with the waters edge, is well clothed with verdure; but being to the south, and directly to the windward of us, we could not fetch it.

On Sunday the 12th, we saw two more small islands, on one of which a boat's crew landed, and found birds so tame, as to be taken by the hand. They were both covered with green trees, but appeared to be uninhabited. The southernmost, with which we were close in, is a slip of land in the form of a half moon, low, flat, and sandy. From the south end thereof a reef runs out to the distance of about half a mile, whereon the sea breaks with great fury. Notwithstanding its pleasant aspect it affords neither vegetables nor water; and the same may be said of the other island, which is distant from it about five leagues. One of them lies in latitude 20 deg. 38 min. south, longitude 146 deg. west; the other in 20 deg. 34 min. south, longitude 146 deg. 15 min. west, and we called them the Duke of Gloucester's Islands. They may be the land seen by Quiros, as the situation is nearly the same; but however this be, we went to the southward of it, and the long billows we had here, convinced us that no land was near us in that direction. Captain Carteret was peculiarly unfortunate in having seen four islands, not one of which was capable of yielding the least refreshment to the ship's company, in the important articles of fruit and water; in consequence of which the men became very sickly, and the scurvy made swift progress among them. The wind here being to the eastward, we hauled to the southward again; and on the 13th, in the evening, as we were steering W. S. W. we lost the long rolling billows in latitude 21 deg. 7 min. south, and got them again on the 14th, at seven o'clock, A. M. in latitude 21 deg. 43 min. south, longitude 149 deg. 48 min. west; from whence our Captain conjectured, that there was then some land, not far off, to the southward. From this day to Tuesday the 16th, the winds were variable, and blew very hard, with violent gusts, one of which was very near being fatal to us. These were accompanied with thick hazy weather, and heavy rain. We were then in latitude 22 deg. south, and in 70 deg. 30 min. west, of our departure. After some time the wind settled in the W. S. W. which drove us again to the northward, so that on Monday the 20th, we were in latitude 19 deg. south, and in 75 deg. 30 min. west of our departure. On the 22nd, we were in latitude 18 deg. south, longitude 161 deg. west of London, and 1800 leagues westward of the continent of America; yet in all this run not any signs of a continent were discovered. As the scurvy was now daily increasing among our people, and finding all our endeavours, from the badness of the weather, and the defects of the Swallow, to keep in a high southern latitude, were effectual, Captain Carteret thought it absolutely necessary to fix upon such a course as might most probably tend to the preservation of the vessel and her crew. In consequence of this resolution, instead of attempting a S. E. course, in which, considering our condition, and the advanced season of the year, it was scarcely possible to succeed, we bore away to the northward, with a view of getting a trade wind; but at the same time keeping such a track, as, if the charts were to be trusted, was most likely to bring us to some island, where refreshments, of which we stood so much in need, might be obtained; we proposed then, if the ship could be put into a proper condition, to have proceeded at the proper season to the southward, and to

No. 34.

have attempted farther discoveries; and should a continent have been discovered, and a supply of provisions procured, we, in this case, intended to keep along the coast to the southward, till the sun had crossed the equinoctial line; and then, after having got into a high southern latitude, to have steered either west about to the Cape of Good Hope, or returned to the eastward, and in our way to England, to have touched, if necessary, at Falkland's Islands. Wednesday the 22nd, in latitude 16 deg. south, and not before, we found the true trade wind; and to Saturday the 25th, we had foul weather, hard gales, and a great sea to the eastward. We were now in latitude 12 deg. 15 min. south, and seeing great flocks of birds, we were inclined to think, that we were near some land, particularly several islands, one of which was called by Commodore Byron, the island of Danger; none of which, however, could we see. On the 26th, in the morning, we were in latitude 10 deg. south, and in 167 deg. west longitude. We kept nearly in the same parallel, hoping to fall in with Solomon's Islands, this being the latitude in which the southernmost of them is laid down. At this time we had a strong trade wind, with violent squalls, and much rain.

On Monday the 3rd of August, we were 5 deg. to the westward of the situation of those islands in the charts; and about 2100 leagues distant from the continent of America. We were this day in latitude 10 deg. 18 min. south, and in 177 deg. 30 min. east longitude by account; yet it was not our good fortune to fall in with any land; but probably we might pass near some, which the haziness of the weather prevented our seeing; for in this run great numbers of sea-birds were frequently hovering about the ship: however, observes Captain Carteret, "as Commodore Byron, in his last voyage sailed over the northern limits of that part of the ocean in which the islands of Solomon are said to lie, and as I sailed over the southern limits without seeing them, there is great reason to conclude, that, if there are any such islands, their situation, in all our charts, is erroneously laid down." This day the current was observed to set strongly to the southward, though it had hitherto, from the Straits of Magellan, ran in a contrary direction; whence we concluded, that the passage between New Zealand and New Holland opened here in this latitude. The difficulties which our able navigator had to contend with, will appear to have been as great as the best seamen and the firmest minds were capable of making head against, from the following description which he gives of his perplexity at this time. "Our stock of log-lines, observes the Captain, was now nearly exhausted, though we had already converted all our fishing lines to the same use. I was for some time in perplexity how to supply this defect; but upon a very diligent enquiry found that we had, by chance, a very few fathoms of thick untarred rope. This, which in our situation, was an inestimable treasure, I ordered to be untwisted; but as the yarns were found to be too thick for our purpose, it became necessary to pick them into oakham; and when this was done, the most difficult part of the work remained; for this oakham could not be spun into yarn, till by combing, it was brought into hemp, its original state. This was not seamen's work, and if it had, we should have been at a loss how to perform it for want of combs, and it was necessary to make these before we could try our skill in making hemp. Upon this trying occasion we were again sensible of the danger to which we were exposed by the want of a forge: necessity, however, the fruitful mother of invention, suggested an expedient. The armourer was set to work to file nails down to a smooth point, with which was produced a tolerable succedaneum for a comb; and one of the quarter masters was found sufficiently skilled in the use of this instrument to render the oakham so smooth and even, that we contrived to spin it into yarn, as fine as our coarse implements would admit; and thus we made tolerable log-lines, although we found it much more difficult than to make cordage of our old cables, after they had been

converted into junk, which was an expedient we had been obliged to practice long before. We also had long before used all our sowing sail-twine; and if (knowing the quantity with which I had been supplied was altogether inadequate to the wants of such a voyage) I had not taken the whole quantity that had been put on board to repair the seine into my own custody, this deficiency might have been fatal to us all."

We had now sailed over upwards of 110 deg. of longitude, in a dull shattered vessel, that, on account of her bad condition would scarcely answer the helm, nor had we met with any spot of earth which would afford us effectual relief. The scurvy continued to make great progress; inasmuch, that those hands which were not rendered useless by disease, were worn down by excessive labour; and, to render our situation completely distressful, on the 10th of August, the *Swallow* sprung a leak in her bows, which being under water, it was impossible to come at while we were at sea. Our situation was now in the highest degree perilous; but on Wednesday the 12th, at break of day, land was discovered, which gave fresh spirits to our almost desponding crew, and the transport of joy which this prospect occasioned, may be compared to that which a criminal feels who hears the cry of a reprieve at the place of execution. The Captain counted seven islands, and we made sail towards two of them which were right a-head, and lay very near together. In the evening we came to an anchor on the north-east side of the largest and highest of them, whereon we saw two of the natives, who were negroes, with woolly heads, and who were not covered with any kind of clothing. A boat having been sent on shore, the two negroes fled, and an account was brought back by our people, that there was a fine run of fresh water opposite to the ship, but that it would be difficult to procure the water, the whole country being covered with wood quite to the sea-shore. That no vegetables for the restoration of the sick could be found, nor any habitations, as far as the country had been examined, which appeared wild, forlorn, and mountainous. These circumstances, added to the danger there might be of the natives attacking us from the woods, determined the Captain to look for a more convenient landing-place. On the 13th, therefore, at day-break, the master, with 15 seamen, well armed, and provided, were sent off in the cutter to the westward, in search of a watering-place, refreshments for the sick, and a convenient situation, where the ship might be laid down in order to examine and stop her leak. He received strict orders to be upon his guard against the natives, but at the same time to conciliate their good will, to procure which he took with him a few beads and other trifles, which by chance happened to be among the ship's company: he was also enjoined particularly by the Captain, to return to the ship if any occurrence happened that might occasion hostilities: he was likewise charged on no account to leave the boat, nor to suffer more than two men to go on shore at a time, while the rest stood ready for their defence; and the Captain recommended to him, in the strongest terms, a diligent discharge of his duty, in finding out a proper place for the ship; which service, of the utmost importance to us all, when performed, he was to return with all possible speed. At the time the cutter was dispatched on this expedition, the long boat was likewise sent off, with ten men on board well armed, which soon returned laden with water. She was dispatched a second time, but upon our observing some of the natives advancing to the landing-place, a signal was made for her to return; for we knew not to what number they might be exposed, and we had no boat to send off with assistance, in case they should have been attacked. After our men had returned on board, we saw three of the Indians, who sat down on the shore, looking steadfastly on the ship for several hours. The lieutenant was sent to them in the long boat, with a few trinkets, to endeavour to establish some kind of intercourse, by their means, with the rest of the natives; but when the three

men saw the boat approaching, they quitted their station, and moved along the coast, where they were joined by three others. When they had conferred together, the former went on, while the latter advanced hastily towards the boat. This being observed from the ship, a signal was made for the lieutenant to act with caution, who, seeing only three men of the natives, backed the boat into shore, and offered them some presents as tokens of friendship, at the same time concealing carefully their arms. The Indians regardless of the beads and ribbonds, advanced resolutely, and then discharged their arrows, which went over the boat without doing any mischief; upon which they ran away instantly into the woods, and our people fired in their turn, without doing any execution, nor one of them being wounded by the shot. In a short time after this the cutter came under the ship's side, the master who commanded her having three arrows sticking in his body. We needed no other proof to convince us he had acted contrary to the Captain's orders, as appeared fully from his own report, which was, in substance, as follows: He said, that having seen some Indian houses, but only a few of the natives, at a place about 14 miles to the westward of the ship, he came to a grappling, and veered the boat to the beach, where he landed with four men, armed with muskets and pistols: that the Indians, at first, were afraid of him, and retired, but that soon after they came down to him, and he gave them a few trifles, with which they seemed to be much pleased: that in return they brought him a broiled fish, and some broiled yams: that, encouraged by these appearances of hospitality, he proceeded with his party to the houses, which were not more than 20 yards from the water-side, and soon after saw a great number of canoes coming round the western point of the bay, and many Indians among the trees: that being somewhat alarmed at their motions, he left hastily the house where he had been entertained, and made the best of his way towards the boat; but that before he could embark, a general attack was made, with bows and arrows, as well on those in the boat, as on those upon the shore. Their number, according to his account, was between three and four hundred: their weapons were bows and arrows; the bows were six feet five inches long, and the arrows four feet four, which, he said, they discharged in platoons, as regularly as the best disciplined troops in England: that, being thus attacked, his party found it necessary to fire upon the Indians, which they did repeatedly, killing some, and wounding many more: still however they were not discouraged; but maintained the fight, pressing forward, and discharging their arrows in almost one continued flight: that when our people arrived at the boat, a delay was occasioned in hauling her off, by the grappling being foul; during which time, he, and half of his crew were desperately wounded: that at last they cut the rope, and ran off under their fore-sail, still keeping up their fire with blunderbusses loaded with eight or ten balls, which the enemy returned with a shower of arrows, and waded after them breast-high into the sea: when they got clear of these assailants, the canoes pursued them with great vigour, nor would they retreat till one of them was sunk, and many of the people in the others were killed. This is the account of the master, which, it is reasonable to suppose, was as favourable to himself as he could make it. This rash man, with three of our best hands, died some time afterwards of the wounds they had received. It appeared from the evidence of the survivors, that the Indians behaved with the greatest confidence and friendship, until the master arrogantly ordered the people who were with him, and who had been generously entertained, to cut down a cocoa-tree; and even persisted in that order, notwithstanding the natives discovered strong marks of displeasure. The Indians hereupon withdrew, and muttering their whole force, proved by their manner of attack, that their courage was equal to their hospitality. After this disaster, Captain Carteret dropped all thoughts of removing to

a more eligible harbour, but he determined to try what could be done towards putting the ship in a better condition, while we continued in our present station.

Accordingly, Friday the 14th, she was brought down by the stern, and means were found by our carpenter, the only one of the whole crew in tolerable health, to reduce the leak, though he could not quite stop it. In the afternoon the Swallow rode with her stern very near the shore; and we observed several of the natives sculking among the trees upon the beach, watching our motions. On the 15th, in the morning, the weather being fine, the ship was veered close in shore, upon which, having a spring upon our cable, we brought her broadside to bear. It was now become absolutely necessary, for the preservation of all on board, that water should be procured; but the only spring that had been seen on the island was skirted with a thick impenetrable wood, from whence the Indians could discharge their arrows unperceived; the Captain was therefore reduced to the painful necessity of driving them from that lurking-place, by discharging the ship's guns, which caused the lives of many of the natives to be sacrificed; for at the time the people were at the watering-place, their ears were assailed by dreadful groans from different parts of the wood, like those of dying men.

Captain Carteret had long been ill of an inflammatory and bilious disorder, of a nature similar to that which had seized Captain Wallis; yet, hitherto, he had been able to keep the deck; but this day the symptoms became so violent as to compel him to take to his bed, to which he was confined for some time afterwards. To aggravate our misfortunes, the master of the Swallow was dying of his wounds; Mr. Gower, our lieutenant, was very ill; the gunner and 30 of our seamen were unfit for duty; among which last were seven of the most healthy, who had been wounded with the master, three of them mortally; the recovery of the Captain and lieutenant was very doubtful; and, except these two, there was no one on board capable of navigating the ship home. It has already been observed, that we were unprovided with any toys, iron tools, or cutlery ware, which might have given us a chance for recovering the good-will of the natives, and establishing a traffic with them for those refreshments we most needed, and which they could have furnished us with. Under these circumstances, whereby our people were greatly disappointed, our commander was obliged to lay aside all thoughts of prosecuting the voyage farther to the southward, which the Captain intended, as soon as the proper season should return. On Monday the 17th, therefore, we weighed, having called this place Egmont's Island, in honour of a noble earl of that name; but Captain Carteret, in his chart, has called this island New Guernsey, of which he was a native. In his opinion it is the same as that to which the Spaniards gave the name of Santa Cruz. The place in which we lay was called Swallow Bay; the eastermost point thereof Swallow Point; the westermost, Hanway's Point. The N. E. promontory of the island was named Cape Byron. From Swallow Point to Cape Byron is about 7 miles E. and from Hanway's Point to the same cape is about 10 miles. Between Swallow Point and Hanway's Point, in the bottom of the bay is a third point, a little to the westward of which we found the best anchoring-place, but it is necessary to give it birth, the ground near it being shoally. When we lay at anchor in this bay, Swallow Point bore E. by N. and Hanway's Point W. N. W. From hence a reef runs, whereon the sea breaks very high: the outer part of this reef bears N. W. by W; and an island which has the appearance of a volcano, was seen just over the breakers. A little beyond Hanway's Point is a small village, which stands upon the beach, surrounded with cocoa-nut trees. It lies in a bay between Hanway's Point and another, which we called Howe's Point; the distance from the former to the latter is about five miles. We found close to the shore 30 fathoms water, but in crossing the bay, at the distance of two miles, we had no bottom. Beyond Howe's Point, another harbour opens, which had the

appearance of a deep lagoon, this we called Carlisle Harbour. Over against its entrance, and north of the coast, a small island was discovered, which we named Portland's Island. A reef of rocks runs on the west side of this to the main; and the passage into the harbour is on the east-side of it, running in and out E. N. E. and W. S. W. its width is two cables length, and it has eight fathoms water. The harbour may be a commodious one, but a ship must be warped both in and out, and would be in danger if attacked by the natives, who are bold even to temerity, and have a perseverance, not common among rude savages. West of Portland's Island, is a fine small round harbour, just big enough to receive three vessels, which was named Byron's Harbour. Our boat having entered it, found two runs of water, one fresh and the other salt; from observing the latter we judged it had a communication with Carlisle Harbour. Having proceeded about three leagues from where the Swallow lay at anchor, we opened the bay where our cutter had been attacked by the Indians, which we called for that reason Bloody Bay. Here is a rivulet of fresh water, and many houses regularly built. Near the water-side stood one nearly built and thatched; it seemed to be a kind of council-room, or state-house, and was much longer than any of the rest. In this the master and his party had been courteously received by the natives, before the wanton cutting down of the cocoa-nut tree. We were informed by those of our people who had been received here, that a large number of arrows were hung in bundles round the room, the floor and sides of which were covered with matting. In the neighbourhood of this place, they said, were many plantations enclosed by stone-walls, and planted with fruit trees; the cocoa-nut trees we could discern from the ship, in great numbers, among the houses of the village. Three miles westward of this, we saw another village of considerable extent, in the front whereof, towards the sea, was an angular kind of breast-work, of stone, and near five feet high. Three miles from hence, as we proceeded westward, a bay was discovered, into which a river empties itself. It appeared, when viewed from the mast head, to run very far into the country, and we called it Granville's River. Westward of it is a point, which we named Ferrer's Point; from whence the land forms a large bay, near which is a town of great extent that seemed to swarm like a bee-hive. While the ship sailed by, an incredible number of the inhabitants came forth from their houses, holding something like a wisp of grass in their hands, with which they appeared to stroke each other, at the same time dancing, or running in rings. Sailing on about seven miles to the westward, we saw another point, on which was a large canoe, with an awning over it. To this we gave the name of Cape Carteret. From this a reef of rocks, that appears above water, runs out to the distance of about a cable's length. At a small distance was another village, fortified as that before mentioned. The inhabitants of this place likewise danced as the others had done; after which many of them launched their canoes, and made towards the ship: upon which we lay to, that they might have time to come up; but when they approached near enough to have a distinct view of the Swallow, they lay upon their paddles, gazed at us, but would advance no farther. Being thus disappointed in our hopes of prevailing upon them to come on board, we made sail, and left them behind us. From Carteret Point the land trends away W. S. W. and S. W. forming a deep lagoon, at the mouth of which lies an island, which was named Trevanion's Island. There are two entrances into the lagoon, which, if it affords good anchorage, is certainly a fine harbour for shipping. Having crossed the first entrance, and being off the N. W. part of Trevanion's Island, which was named Cape Trevanion, we saw a great rippling, caused by the meeting of the tides. Having hauled round this cape, we perceived the land trend to the southward, and we continued to stand along the shore, till we opened the western passage into the lagoon between Trevanion's Island and the main; both of which, at this place, appeared

peared to be one continued town, and the inhabitants were innumerable. We found in this entrance a bottom of coral rock, with very irregular soundings. The natives no sooner observed that the boat had left the ship, than they sent off several armed canoes, who advanced to attack her. The first that came within bow-shot discharged her arrows at our people, who, being prepared, fired a volley, by which one of the Indians was killed, and another wounded. We fired at the same time from the ship, a great gun loaded with grape shot, on which all the canoes pulled hard for the shore, except the one with the wounded man, who being brought to the ship, the surgeon was ordered to examine his wounds, one shot had gone through his head, and one of his arms was broke by another. The surgeon was of opinion, that the former wound was mortal, in consequence of this he was put again into his canoe, and, notwithstanding his condition, he with one hand paddled away towards the shore. He was a young fellow, almost as black as a negro of Guinea, with a woolly head; of a common stature, well featured, and, like the rest of the people we had seen upon this island, quite naked. His canoe had an out-rigger, without a sail, but in workmanship it was very rude, being nothing more than part of the trunk of a tree made hollow. We were now at the western extremity of the island; and the distance between that and the eastern extremity is 50 miles due E. and W. A strong current sets westward along the shore. The natives of Egmont Island are extremely nimble, active, and vigorous; and seem to be almost equally qualified to live in the water as upon land, for they were in and out of their canoes every minute. Their common canoes are capable of carrying about a dozen men, though three or four manage them with amazing dexterity. The men have a daring fortitude, which proves them to be descended from the same stock as those who now inhabit the Philippine Isles, lying about 45 degrees more to the westward, whose contempt of death was really astonishing when the city of Manilla was defended against the English, under the command of Sir William Draper.

As we sailed along shore, to raise our mortification to the highest pitch, hogs and poultry were seen in great abundance, with cocoa-nut trees, plantains, bananas, and a variety of vegetable productions, which would soon have restored to us the health and vigour we had lost, by the hardships of a long voyage; but no friendly intercourse with the natives could now be expected, and we were not in a situation to obtain what we wanted by force: besides, great part of the crew were disabled by sickness, and the rest were much depressed in their spirits, by a continual succession of disappointments and vexations; and if the men had been in health, we had not officers to lead them on, or direct them in any enterprize, nor even to superintend the duties that were

to be performed on board the ship; for even the Captain himself was still confined to his bed, dangerously ill. Thus situated, unable to proceed farther to the south, and in danger of being too late for the monsoon, he gave immediate orders for steering north-westward, with a view to fall in with the land which Dampier has distinguished by the name of Nova Britannia, and which was now distant about 12 deg. of longitude. In our distressful situation, it could not be expected, that Captain Carteret should examine all the islands we touched at; curiosity must yield to the instinctive principle of self-preservation; but we gave particular names to several of those we approached; and to the whole cluster we gave the general name of Queen Charlotte's Islands. To the southermost of the two, which when we first discovered land were right a-head, the name was given of Lord Howe's Island, and the other was Egmont Island, of which we have already given a particular account. The latitude of Lord Howe's Island is 11 deg. 10 min. south; longitude 164 deg. 43 min. east. The latitude of Cape Byron, the N. E. point of Egmont Island, is 10 deg. 40 min. south; longitude 164 deg. 49 min. east. These two islands lie exactly in a line with each other, about N. by W. and S. by E. and including the passage between them, extend 11 leagues; the passage is very broad. Both of them appear to be fertile, have a pleasant appearance, and are covered with tall trees of a beautiful verdure. Lord Howe's Island, which is more upon a level than the other, is nevertheless high land. From Cape Byron, distant 13 leagues W. N. W. half N. by compass, is an island of a stupendous height, and in the figure of a cone. Its top is shaped like a funnel, from whence smoke issues, but we saw no flame; we thought it, however, to be a volcano, and therefore called it Volcano Island. To a long flat island, that, when Howe's and Egmont's Islands were right a-head, bore N. W. we gave the name of Keppel's Island. It is situated in latitude 10 deg. 15 min. south; longitude, by our account, 165 deg. 4 min. east. We discovered two others to the S. E. The largest we named Lord Edgecumb's Island, and the smaller Ourry's Island. The former, which has a fine appearance, lies in latitude 11 deg. 10 min. south; longitude 165 deg. 14 min. east, the latter is in latitude 11 deg. 10 min. south; longitude 165 deg. 19 min. east. Egmont Island, in general, is woody and mountainous, intermixed with many beautiful valleys. Several small rivers flow from the interior parts of the country into the sea, and we have mentioned many harbours upon the coast. The inhabitants, whom we have particularly described, do execution at an incredible distance with their arrows. One of them went through the boat's wash-board, and dangerously wounded a midshipman in the thigh. They were pointed with flint, and we saw among them no signs of any metal.

CHAP. II.

The Swallow departs from Queen Charlotte's Islands—Her run to Nova Britannia—Other islands discovered, with a description of them, and their inhabitants—Nova Britannia found to be two islands, with a strait between them—Several small islands discovered in the strait, with an account of the land and natives on each side—The Swallow enters St. George's Channel—Passage from thence to the island of Mindanao—A description of many islands that were seen, and incidents in this course—A geographical account of the coast of Mindanao, and the islands near it—Errors of other navigators corrected—The Swallow continues her voyage from Mindanao to the island of Celebes—A particular description of the strait of Macassar—Transactions while the Swallow lay off the town.

TUESDAY the 18th of August, we took our departure from Egmont Island, one of the cluster of islands which the Captain named Queen Charlotte's, with a fresh trade wind from the eastward. On the 20th, a small flat island was discovered, and named after Mr. Gower, our lieutenant. It lies in latitude 7 deg. 56 min. south; longitude 158 deg. 56 min. east. The natives did not differ in any thing material, from those of the islands we had lately left; but some cocoa-nuts

were here procured in exchange for nails; and the inhabitants had intimated, that they would furnish a fresh supply the next morning, being Friday the 21st, but, at day break, we found that a current had set the ship considerably to the southward of the island, and brought us in sight of two other islands. They are situated nearly E. and W. of each other, at the distance of about two miles. The smallest, which lies to the eastward, we called Simpson's Island; and to the other, which

which has a lofty appearance, we gave the name of Carteret's Island. From Gower's, the east end bears south, and the distance between them is nearly 11 leagues. Carteret's Island is in latitude 8 deg. 26 min. south; longitude 159 deg. 14 min. east, and its length from E. to W. is 18 miles. As both these islands were to the windward of us, we sailed again to Gower's Island, which abounds with fine trees, many of them of the cocoa-nut kind. Here a canoe was seized, the natives having attempted to cut off the ship's boat; in it we found about 100 cocoa-nuts, which were very acceptable. The canoe was large enough to carry 10 men, and was very neatly built, with planks well joined. It was adorned with shell-work, and figures rudely painted, and the seams were covered with a substance somewhat like our black putty. With respect to its size, it was much larger than any one we had seen at Egmont Island. The appearance of these Indians, and their arms, were much the same as those that had been seen more to the eastward, only spears made an addition to their weapons. By some signs which they made, pointing to our musquets, we concluded they were not wholly unacquainted with fire-arms. We saw some turtle near the beach, but were not fortunate enough to take any of them; but the cocoa-nuts we got here, and at Egmont Island, were of inexpressible service to the sick. As from the time of our leaving Egmont Island we had a current setting strongly to the southward, and finding, in the neighbourhood of these islands, its force greatly increased, we now steered a north-westerly course, fearing we might otherwise fall in with the main land too far to the southward; and the bad condition of the ship, and sickness of the crew, would have rendered it impossible for us ever to have got to sea again, if we had been driven into any gulph or deep bay. On the 22nd, as we were continuing our course with a fresh gale, Patrick Dwyer, a marine, who was doing something over the ship's quarter, by some accident fell into the sea: we immediately threw overboard the canoe we had made a prize of at Gower's Island, brought the ship to, and hoisted out the cutter, but the unfortunate man, though strong and healthy, sunk at once, and was drowned, notwithstanding all our efforts to save him. The canoe we were obliged to cut up, the having received much damage by striking against one of the guns as our people were hoisting her overboard.

On Monday the 24th, we fell in with nine islands, stretching N. W. and S. E. about 15 leagues, and lying in latitude 4 deg. 36 min. south; longitude 154 deg. 17 min. east. These Captain Carteret supposes to be the same which were seen by Tasman, and called by him Ohang Java: the other islands he believes had never been visited by any European before; and he is of opinion, that there is much land not yet known in this part of the ocean. One of these islands is of considerable extent; the other eight are little better than large rocks; but, though low and flat, they are covered with wood, and abound with inhabitants. We steered to the northward of these islands, W. by S. having a strong south-westerly current. In the night we fell in with another pleasant island of considerable extent. By the many fires we saw, it appeared to be inhabited, but we saw none of the natives. We called this flat, green isle, Sir Charles Hardy's Island. It is situated in latitude 4 deg. 50 min. south; and bore west 15 leagues from the northernmost of the nine islands. On the 25th, at day break we discovered another large high island, which received the name of Winchelsea's Island; and is distant from Sir Charles Hardy's Island ten leagues, in the direction of S. by E. On Wednesday the 26th, an island was discovered to the northward, which the Captain supposed to be the same that was seen by Schouten, and called the island of St. John. Not many hours after, Nova Britannia appeared, and the Swallow entered what was thought to be a deep bay, or gulph, which Dampier had distinguished by the name of St. George's Bay. It lies in latitude 5 deg. south; longitude 152 deg. 19 min. east. Here we cast anchor, while the boats went to search for a good harbour; which, when

they returned, and reported to have found, the united strength of the whole ship's company was not sufficient to weigh the anchor; an instance of debility somewhat similar to that related in Commodore Anson's voyage, when the Centurion arrived at Tinian. It was not until the next day, when our strength was somewhat recruited, that the anchor was brought up, and it was then found to have been so much injured, as to be totally unserviceable. No fish could be caught, either by the seine, or hook and line: some rock oysters and cockles were, however, obtained, and in the country some cocoa-nuts, with wood and water. The upper part of the tree which bears the cocoa-nut, is called the cabbage, which is a white, crisp, juicy substance; if eaten raw it tastes somewhat like a chestnut, but when boiled is superior to the best parsnip. This was cut small into the broth, which was made of the portable soup, and being thickened with some oatmeal, made a most comfortable mess; for each of these cabbages we were forced to cut down a tree, which was done with great regret, but the depredation on the parent stock was unavoidable. This regimen, with the milk of the nut, relieved the sick presently, and recovered them very fast. Here we found nutmeg-trees in great plenty: they did not appear to be the best sort, which may be owing partly to their growing wild, and partly to their being too much in the shade of taller trees: all the different sorts of palm were also found. We likewise received great refreshment from the fruit of a tall tree, that resembles a plumb, and particularly that which in the West Indies is called the Jamaica plumb. Here we saw many trees, shrubs, and plants, altogether unknown; but no esculent vegetables of any kind. In the woods, a large bird with black plumage was seen, which made a noise like the barking of a dog. The only quadrupeds some of our people saw, were two of a small size, which were supposed to be dogs: they were very wild, and ran with great swiftness. None of the human race appeared, but we found several deserted habitations. By the shells scattered about them, with some sticks half burnt, and the embers of a fire, it appeared, that the natives had but just left the place when the Swallow arrived, or more probably they fled at her approach. If the people may be judged of from the appearance of their dwellings, they must stand low even in the scale of savage life, for they were the most miserable hovels we had ever seen. A small island in this bay we called Wallis's Island. The harbour, in which our ship lay, received the name of English Cove; and here Captain Carteret took possession of the country, with all its islands, bays, ports, and harbours, for the king his master; nailing upon a high tree a piece of board, faced with lead, on which was engraved an English union, the name of the ship, and her commander; the name given to the cove; and the time of coming in and sailing out of it.

On the 7th of September, being Monday, we left this cove, and anchored on the same day almost close to a grove of cocoa-nut trees, where we plentifully supplied ourselves with fruit and the cabbage. We called this place Carteret's Harbour, which being formed by the main and two islands, one of them was named Leigh's, and the other Cocoa-nut Island. The Captain now resolved to sail for Batavia, while the monsoon continued favourable: on the 9th, therefore, we weighed anchor, and when about four leagues from land, the wind and current being both against us, we steered round the coast into a channel between two islands, which channel was divided by another island, to which Captain Carteret gave the name of the Duke of York's Island, near which are several smaller islands. To the south of the largest of them are three hills of singular form, which were called the Mother and Daughters, one of which we supposed to be a volcano from the large clouds of smoke that were seen issuing from it. A point we called Cape Palliser, lies to the east of these hills, and Cape Stephens to the west; north of which last, lies an island, which took the name of the Isle of Man. The country in general is mountainous and woody, and was supposed to be inhabited, from the numbers of fires seen

on it in the night. On the Duke of York's Island, the houses were situated among groves of cocoa-nut trees, and thus formed a most beautiful prospect. We brought to, for the night, and sailed again in the morning, when some of the Indians put off in canoes towards the ship; but the wind being fair and blowing fresh, it was not thought prudent to wait for them. We now steered N. W. by W. and lost sight of New Britain on the 11th, when it was found that what had been taken for a bay, was a strait, and it was called St. George's Channel, whilst the island on the north of it received the name of New Ireland. In the evening we discovered a large island, well clothed with verdure, which was denominated Sandwich Island: off this island the ship lay great part of the night, during which time a perpetual noise resembling the sound of a drum was heard from the shore. When we had almost cleared the strait, the weather falling calm, a number of canoes approached the ship, and though their crews could not be prevailed on to go on board, they exchanged some trifles with us for nails and bits of iron, which they preferred to every thing else that was offered them. Though the canoes of these people were formed out of single trees, they were between 80 and 100 feet in length. The natives were negroes, and their hair was of the woolly kind; but they had neither thick lips nor flat noses. They wore shell-work on their legs and arms, but were otherwise naked. Their hair and beards were powdered with white powder, and a feather was stuck into the head of each, above the ear. Their weapons consisted of a long stick and a spear; and it was observed, that they had fishing-nets and cordage.

Sailing from hence westward, we came in sight of the S. W. point of the island; it was called Cape Byron; near which is an island of considerable extent, which received the name of New Hanover. The strait we had now passed was called Byron's Strait; one of the largest islands we had seen, Byron's Island, and the S. W. point of New Hanover, Queen Charlotte's Foreland. On the following day, we saw several small islands, which received the name of the Duke of Portland's Islands. Having completely navigated St. George's Channel, the whole length of which is about 100 leagues, we held on a westward course, and on Monday the 14th, discovered several islands. The next morning some hundreds of the natives came off in canoes towards the ship, and were invited on board by every token of friendship and good will; notwithstanding which, when they came within reach, they threw several lances at the seamen on the deck. A great gun and several musquets were then fired at them, by which some were killed or wounded; on which they rowed towards shore; and after they had got to a distance, a shot was fired, so as to fall beyond them, to convince them that they were not out of the reach of the guns. Soon after, some other canoes advanced from a distant part of the island, and one of them coming nearer than the rest, the people in it were invited on board the ship: instead of complying, they threw in a number of darts and lances. This assault was returned by the firing of several musquets, by which one of the Indians was killed; on which his companions jumped over-board, and swam to the other canoes, all of whom rowed to the shore. The canoe being taken on board, was found to contain turtle, and some other fish, also a fruit of a species between an apple and a plum, hitherto unknown to Europeans. These people were mostly negroes, with woolly hair, which they powdered, and went naked, except the ornaments of shells round their arms and legs. We now coasted along the islands, to which we gave the general name of the Admiralty Islands. They have a beautiful appearance, being covered with woods, groves of cocoa-nut trees and the houses of the natives. The largest we computed to be about 50 miles in length; and they produce many valuable articles, particularly spices. We discovered two small verdant islands, on Saturday the 19th, which were called Durour's Island and Mitty's Island, the inhabitants of which last ran along the coast with lights during the

night. We had sight of other two small islands on the 24th, which were called Stephens's Islands, and which abounded with beautiful trees. We saw also three islands on Friday the 25th, in the evening, when the natives came off in canoes, and went on board the ship. They bartered cocoa-nuts for some bits of iron, with which metal they did not seem unacquainted, and appeared extravagantly fond of it. They called it parram, and hinted that a ship sometimes touched at their islands. These people were of the copper colour, and had fine black hair; but their beards were very small, as they were continually plucking the hair from their faces. Their teeth were even and white, and their countenances very agreeable. They were so extremely active that they ran up to the mast head quicker than the sailors. Every thing that was given them they ate and drank with freedom, and seemed to have no sort of reserve in their behaviour. A piece of fine matting wrapped round their waists, constituted the whole of their dress, and good nature appeared to be the only rule of their actions. The current carrying the ship swiftly along, the Captain had not the opportunity of landing; and was therefore obliged to refuse gratifying these friendly people in that particular, though they very readily offered that some of their people should remain as hostages for the safe return of any of the officers or ship's company who should chuse to go on shore. Finding that their offer was not accepted, one of the Indians absolutely refused to quit the ship: he was carried in consequence, as far as the island of Celebes, where he died. This man was named Joseph Freewill, and we called the largest of the isles, Freewill Island, (by the natives called Pegan.) The names of the two other islands were Onata and Onello.

An island was discovered from the mast-head as we held on our course, on Monday the 28th, in the evening, but we neither landed there nor gave it a name. Monday the 12th of October, we saw a small isle which we named Current Island, from the great strength of the southerly current in those parts; and the next day two islands were discovered, to which we gave the name of St. Andrew's Island. The next land appeared to be Mindanao, along the S. E. part of which we coasted, seeking for a bay which Dampier had described; but this we could not find. The boat, however, found a little creek at the southern extremity of the isle, near which a town and a fort were seen. The people having descried the boat from the shore, a gun was fired, and several canoes came off after it. The lieutenant therefore retreated towards the ship, which when the canoes discovered, they retired and made towards the shore. We now stood to the eastward, and on Monday the 2d of November, anchored in a bay near the shore, whither the boats were dispatched to take in water. No signs appeared of that part of the island being inhabited; a canoe however came round a point, seemingly with a view of observing us, which rowed back again, after having taken a survey of the vessel. In the night, a great noise was heard on the shore, somewhat like the war-song of the Americans. The Captain therefore made proper preparations to defend himself in case hostilities should be commenced on the part of the islanders. One of the boats was sent on shore for water the next morning, and the other was ordered to hold herself in readiness, in case her assistance should be necessary. The crew had no sooner landed than several armed men came forward from the woods, and one of them held up something white, which being construed as a sign of amity, the Captain having no white flag on board, determined to send the lieutenant with a table cloth in order to answer the token of peace. For the present this had the desired effect. Two Indians, who spoke bad Dutch and Spanish, having at last made themselves understood by the officer, in the latter language, made several inquiries which chiefly turned upon desiring to be informed whether the ship belonged to the states of Holland, and whether she was bound to Batavia or elsewhere. He also wanted to know

know whether she was a ship of war, and what number of guns she carried. Having been resolved as to these particulars, he said they might proceed to the town; some armed Indians were ordered to retreat, and the lieutenant presented a silk handkerchief to the person he conversed with, receiving a neckcloth in return. When the Captain heard this, he was highly pleased, thinking that all matters were now in a proper train, especially as he had received a supply of water; but while he was enjoying this prospect, he perceived some hundreds of armed Indians on the shore, who held up their targets, and brandished their swords, by way of defiance, and at the same time discharged their lances and arrows towards the vessel. Notwithstanding this hostile appearance, the Captain was still willing, if possible, to avoid coming to extremities with the islanders, and for that purpose, sent the lieutenant on shore to display again the former sign of peace. As the boat approached the shore, but without landing her men, one of the natives beckoned them to come where he stood, but the lieutenant did not chuse to obey this summons. lest he should come within reach of the arrows of the islanders. He now concluded that there were Dutchmen or people in the Dutch interest on shore, to whose interference this apparent alteration in the disposition of the natives was owing, and who had irritated the natives against the Swallow's crew, on being informed that she was an English vessel. Captain Carteret however failed from this place, which he called Deceitful Bay, with a full intention to visit the town; but soon after the wind blowing violently in shore, he altered his resolution, and steered directly for Batavia, which was probably the best course he could have taken in such a critical situation.

On Saturday the 14th of November, we reached the strait of Macassar, which strait lies between the islands of Celebes and Borneo. To a point of the former, we at this time gave the name of Hummock Point; and to the westward of this point we discovered a great many boats fishing upon the shoals. On the 21st, we were in sight of two very small islands, which were covered with verdure, and Captain Carteret supposed them to be the Taba Isles, mentioned in the French charts. We crossed the equinoctial line, and came into southern latitude, on Sunday the 29th; the tornadoes becoming violent, and the current setting against us. Death had now diminished the crew, and sickness was daily weakening the remainder. We had sight of the Little Pater-Nosters (islands so called) which are situate something more than two degrees to the southward of the equinoctial line, but the winds and currents would not suffer us at that time to land for any refreshment. At this time the whole crew were alike afflicted with the scurvy; and what was very distressing we were attacked soon after in the night by a piratical vessel, which had been seen the evening before. She engaged us with swivel guns and small arms; but though we could not see the enemy, we returned her fire so warmly that we sent her to the bottom, and all her crew perished. As to the Swallow she received some small damage, and had two persons wounded on board. The vessel that she sunk belonged to a pirate who had no less than thirty of them engaged in the business of plunder, which constantly infested these seas.

The diseases of our men now daily increased. By the 12th, we had lost 13 of our crew, and 30 others were almost on the point of death. The westerly monsoon being set in we could have no hopes of reaching Batavia, and our situation was such that we must perish if we could not speedily make land. On this account, it was resolved to steer for Macassar, a Dutch settlement on the island of Celebes; and happily we accomplished our design, coming to anchor off that island, at the distance of more than a league from Macassar, on Tuesday the 15th of December.

The governor sent a Dutchman on board the Swallow late that night, who seemed much alarmed on finding that she was an English ship of war, and would not trust himself in the cabin. Early the next morning, the

Captain dispatched a letter to the governor, requesting leave to buy provisions, and to shelter his ship till the season for sailing westward came on. The boat arriving at the shore, none of the crew were suffered to land; and the lieutenant having refused to deliver the letter to any but the governor himself, two officers, called the Shebandar and the Fiscal, came to him with a message, importing that the governor was sick and had commanded them to come for the letter. The lieutenant, though he thought this was only a mere pretence, at length delivered the letter, which they took away with them. After the boat's crew had waited without any refreshments for several hours in the heat of the sun, they were told that the governor had ordered two gentlemen to wait on their Captain with an answer. As the boat lay off the wharf, our people on board observed a great hurry on shore, and concluded that all hands were busy in fitting out armed vessels, a circumstance which could not much contribute to our satisfaction. But according to the promise given, soon after the boat's return, two gentlemen of the names of De Cerf and Douglas, came with dispatches, desiring, that the ship might instantly depart from the port, without coming any nearer to the town; insisting that she should not anchor on any part of the coast, and that the Captain should not permit any of the people to land on any place under the governor's jurisdiction.

The Captain could not but sensibly feel the cruelty of this proceeding. As the strongest argument that could be used in answer to the letter, he shewed his dying men to the gentlemen, and urged the necessity of the case; nor could they but feel the propriety of granting refreshments to the subjects of a power at peace with their country, and who were in such a deplorable situation; but they observed that their orders were absolute and must be obeyed. Incensed at this treatment, Captain Carteret, at last, declared, that he would come to an anchor close to the town, and then, if they persisted in refusing him necessary refreshments, that he would run the ship aground, when his crew would sell their lives as dear as possible. Being alarmed at this declaration, they intreated the Captain to remain in his present situation till further orders should arrive. This he promised, on condition that an answer should be sent before the setting in of the sea-breeze the next day.

In the morning early, it was observed that a sloop of war, and another vessel with soldiers on board, anchored under the ship's bows. They refused to speak with Captain Carteret, and as he weighed and set sail with the sea-breeze, they did the same, and closely followed him. As he proceeded, a vessel from the town approached him, wherein were several gentlemen, and Mr. Douglas among them; but, till the Swallow dropped anchor they could not come on board. They expressed some surprize at the English vessel's having advanced so far; but the Captain alledged that he had only acted according to his former declaration, which his present situation would sufficiently justify to every candid person.

These gentlemen brought with them two sheep, some fowls, fruit, and other provisions, which were extremely welcome to the English; but, after they had made several proposals, with which he could not comply, he shewed them the dead body of a man who had expired but a few hours before, and whose life might probably have been saved, had the Dutch sent them a timely supply of refreshments, and again declared his resolution of executing what he had threatened, if they would not comply with his requisition. His guests now enquired whether the ship had touched at the spice islands, and were answered in the negative. At last it was agreed, that the Swallow should sail for a bay at a little distance, where an hospital for the sick might be provided, and where provisions were generally plentiful, and, if there was a want of any article, they might be supplied occasionally from the town. It will be imagined that a proposal of this kind was readily agreed to by Captain Carteret; all he insisted upon was, that it should be ratified by the governor and council, which was afterwards

wards done in the proper manner. He could not forbear asking, however, for what reason the two vessels had anchored under his ship's bows. He received for answer, that this was only done in a friendly manner, to protect her from any insult that might be offered by the natives of the country. While this treaty was going forward, the English Captain had nothing to give his guests but rotten biscuit and bad salt meat; however, they had ordered an elegant dinner to be dressed on board their own vessel, which was afterwards served up at his table, and they parted in friendship.

The next day an officer from the town came on board, to whom the Captain applied to get money for his bills on the English government. He promised to endeavour to do this, and for that purpose went on shore, but when he returned in the evening, he said that there was no person in the town that had any cash to remit to Europe, and that the company's chest was quite empty. This was a great difficulty; however it was surmounted at last by an order being sent to the Resident at Bonthain, who had money to remit, and who, in consequence received the bills in question.

CHAPTER III.

The Swallow sails from Macassar to Bonthain—Transactions during her stay at this place—A description of the town of Macassar and circumjacent country—She proceeds from the bay of Bonthain, in the island of Celebes, to Batavia, in the island of Java—Remarkable incidents and transactions—The Swallow anchors at Onrust, in order to have her defects repaired—An account of the Dutch governor, and the courteous behaviour of Admiral Houting to Captain Carteret—The Swallow being refitted departs from Onrust—Loses many of her hands by sickness—Arrives at Princes Island in the Strait of Sunda—Run from thence to the Cape of Good Hope—Anchors in Table Bay—Makes the island of St. Helena—Proceeds to the island of Ascension, and comes to an anchor in Cross Hill Bay—Continues her voyage—Is hailed by a French ship, commanded by M. Bougainville—Enters the English Channel—And, after a fine passage, and fair wind, from the Cape of Good Hope, anchors at Spithead, on Saturday the 20th of March, 1769, having been absent two years and seven months.

ON Tuesday the 15th, we anchored, as we have observed, at the distance of four miles from the town of Macassar, which, by our reckoning, lies in latitude 5 deg. 10 min. S. and in 117 deg. 28 min. E. longitude, having been in our run from the Strait of Magellan not less than 35 weeks. On Sunday the 20th, we failed, at day-break, and in the afternoon of the ensuing day, anchored in the road of Bonthain. The guard boats were immediately moored close to the shore, to prevent all communication between our boats and those of the country. Captain Carteret having waited upon the resident, to settle the price, and mode of procuring provisions, a house was allotted to his use, situated near the sea-side, and close to a small fort of eight guns, the only one in this place. The house being fitted up as an hospital, the sick were landed, and as soon as our people were on shore, a guard of 36 privates, two sergeants, and two corporals, under the command of Le Cerf, was set over them, who were not permitted to above 30 yards from the hospital, nor were any of the natives suffered to come near enough to sell them any thing; so that the profits of the traffic fell into the hands of the Dutch soldiers, whose gains were immoderate; so great indeed, that some of them sold various articles at a profit of more than a thousand per cent. after having extorted the provisions at what price they pleased from the natives; and if a countryman ventured to express any signs of discontent, a broad sword was immediately flourished over his head; this was always sufficient to silence complaint, and send the sufferer quietly away. The Captain having remonstrated with Mr. Swellingrable on the injustice of this procedure, he reprimanded the soldiers with becoming spirit; but this produced no good effect; and after this, Le Cerf's wife sold provisions at more than double the prime cost, while it was suspected, that he sold arrack to the seamen. It was the duty of one of the soldiers, by rotation, to procure the day's provision for the whole guard, which service he performed by going into the country with his musquet and bag; nor was this honest provider satisfied with what his bag would hold, for one of them, without any ceremony, drove down a young buffalo, and his comrades supplied themselves with wood to dress it from the pallisadoes of the fort. The Captain thought the report of this fact so extraordinary, that he went on shore to see the breach, and found the poor blacks repairing it. On the 26th and 27th, three vessels arrived here, one of which had troops on board, destined for the Banda Islands, but

their boats not being allowed to speak with any of our people, the Captain prevailed on the resident, to purchase for his use four casks of very good salt provisions, two being pork, and two beef. On Monday the 28th, above 100 country vessels, called proas, anchored in the bay of Bonthain. These vessels fish round the island of Celebes, going out at one monsoon, and coming back with the other: they carry Dutch colours, and send the produce of their labours to China for sale.

On Monday the 18th of January, a letter A. D. 1768. from Macassar was brought to the Captain, by which he was informed, that the Dolphin, our old consort, had been at Batavia. On Thursday the 28th, the secretary of the council, who accompanied Le Cerf hither, received orders to return to Macassar. Our carpenter by this time having greatly recovered his health, began to examine into the condition of the Swallow, and she was found to have several leaks; and as little could be done to these, we were reduced to an entire dependance on our pumps. Her main-mast was also sprung, and appeared to be rotten. As no wood could be procured here to make a new one, we patched it up, without either iron or forge, as well as we could. On the 19th of February, Le Cerf, the military officer was recalled, in order, as was reported, to make preparations for an expedition to the island of Bally; and on Monday the 7th of March, the largest of the guard-boats, a sloop of 40 tons, was likewise ordered to return to Macassar, with part of the soldiers. On the 9th, the resident received a letter from the governor, enquiring when Captain Carteret would sail for Batavia, though he must have known this would not be before the eastern monsoon set in, which would not be till May. These were suspicious circumstances, which gained strength toward the conclusion of the month, at which time a canoe was observed to paddle round the ship, several times in the night, and to retire as soon as she was seen. It is proper to observe here, that the town of Macassar is in a district called Macassar, or Bony, the king whereof is an ally of the Dutch, who have frequently been repulsed in their attempts to reduce other parts of the island, one of which is inhabited by a people called Buggueffes, and another Waggs, or Tolora. The last place is fortified with cannon; for the natives were acquainted with the use of fire-arms, and were supplied with them from Europe, before the Dutch settled themselves at Macassar in the room of the Portuguese.

On Tuesday the 29th, a black man delivered a letter

to our lieutenant, directed to "The Commander of the English ship at Bonthain," the purport of which was to acquaint the Captain, that the king of Bony, in conjunction with the Dutch, had formed a design to cut us off; they were not to appear in the business, but the son of the king of Bony was appointed the principal agent. Besides the plunder of the Swallow, he was to receive a gratuity from his employers. The letter intimated that he was now at Bonthain, with 800 men, ready to execute the project, which was formed from a jealousy of our being connected with the enemies of the Dutch, with a view of expelling them out of the island; or at least they suspected, that by our intelligence, a scheme of that kind might be planned, on our return to England. This letter became a new subject of speculation, and though ill written, with respect to style and manner, yet it did not therefore deserve the less notice; especially when we recollected the recall of *Le Cerf*, and other remarkable circumstances, which have been already related. However, whether the intelligence, and our conjectures, were true or false, it was our duty to take proper measures for our security. Accordingly all hands were immediately set to work. We rigged the ship, bent the sails, unmoored, got springs upon our cables, loaded all our guns, and barricaded the deck. Every one slept under arms during the night; and the next day being the 30th, we fixed four swivel guns on the fore part of the quarter deck; and warped the ship farther off from the bottom of the bay, towards the eastern shore, that, in case of necessity, we might have more room for action. At this time the resident was up the country, transacting business for the company, and, before his departure, he told the Captain, he should certainly return by the 1st of April. It was now the 4th, and we had neither seen him, nor received any answer to a letter the Captain had wrote him; but on Tuesday the 5th, he came on board, and a few minutes convinced us, he was not in any respect privy to the supposed design against us. He acknowledged, that a minister of the king of Bony, had lately paid him a visit, and had not well accounted for his being in this part of the country; and, at the Captain's request, very readily undertook to make farther enquiries concerning Bony and his people; and a few days after he sent us word, that having made a very strict enquiry, whether any persons belonging to the king of Bony had been at Bonthain, he had been informed, that one of the princes of that kingdom had been there in disguise; but that of the 800 men, who were said, according to our intelligence, to be with him, he could find no traces. At this visit, while aboard, Mr. Swellingrabel took notice of the ship, observing, that it was put in a state of defence, and seeing every thing ready for immediate action, he said, that the people on shore had informed him of our vigilance and activity, and in particular, of our having exercised our men at small arms every day. In return, the Captain told him, we should continue on our guard, which he seemed to approve, and we parted with mutual promises of friendship and good faith.

On Saturday the 16th, the resident, M. *Le Cerf*, with another officer, who was likewise an ensign, came on board and dined with us. After dinner, the Captain asked *Le Cerf*, what was become of his expedition to Bally, to which he answered drily, that it was laid aside, without saying any thing more on the subject. On the 23rd, he returned to Macassar, and the other ensign took upon him the command of the soldiers that still remained at this place. The season now advanced apace, when navigation to the westward would again be practicable, which gave us all great pleasure, especially as putrid fevers began to make their appearance among us, by which several were attacked, and one was carried off. On the 7th of May, Captain Carteret received a long letter, written in Dutch, from the governor of Macassar, the general purport of which was, to exculpate himself from the charge of having, in conjunction with the king of Bony, formed a design to cut us off. He denied, in the most solemn manner, his

having the least knowledge of such a project, and required the letter to be put into his hands, that the writer might be brought to such punishment as he deserved; but the Captain would not deliver up the letter, knowing that the writer would certainly have been punished with equal severity, whether the contents were true or false; and it must be confessed, we had the greatest reason to believe that there was not sufficient ground for the main charge contained therein, though it is not equally probable that the writer believed it to be false. By the 22nd, we were ready to sail from this place, but before we take our departure, we shall make a few observations; and also give a particular account of the situation, trade, and produce of the Sunda Islands, the manners and customs of the inhabitants, &c. as these places are generally mentioned, and some of them touched at, by all our circumnavigators.

I. *Of the Celebes, or the island of Macassar.*

Southward of the Philippines (of which we have given a full description) lies the island of Celebes, or Macassar, extending from 1 deg. 30 min. N. latitude, to 5 deg. 30 min. S. having the great island of Borneo on the west, and the Moluccas on the east. The length of it from the S. W. point to the N. E. is about 500 miles, and in the broadest part of it, it is near 200 miles over. The fourth part of the island is divided by a bay seven or eight leagues wide, which runs forty or fifty leagues up into the country, and on the east-side of the island are several bays and harbours, and abundance of small islands and shoals: towards the north there is some high land: but on the east the country is low and flat, and watered with many little rivulets. This island is divided into six petty kingdoms or provinces, the principal whereof are Celebes, on the N. W. lying under the equinoctial; and Macassar, which takes in all the south part of the island: the rest of the provinces were usually under the dominion of one of these; whereupon the island sometimes receives its name from one, and sometimes from the other.

The air is hot and moist, the whole country lying under or very near the line, subject to great rains. It is most healthful during the northern monsoons: if they fail of blowing at their accustomed time, the island grows sickly, and great numbers of people are swept away. They have mines of copper, tin, and gold, but we do not find they are much wrought; the gold they have is found chiefly in the sands of their rivers, and at the bottom of hills, washed down by torrents. In their woods they have ebony, calambac and sanders, and several sorts of wood proper for dying; and no place, it is said, affords larger bamboos, some of them being four or five fathoms long, and above two foot diameter, which they make use of in building their houses and boats. Their fruits and flowers are much the same with those in the Philippines, and therefore we shall not tire the reader with a repetition of them, only mention some of the principal. They have pepper and sugar of their own growth, as well as betel and arek, in great plenty; but no nutmegs, mace or cloves; however, of these they used formerly to import such quantities from the spice islands that they had sufficient for their own use, and sold great quantities to foreigners. Their rice is said to be better than in any other parts of India, it not being overflowed annually as in other countries, but watered from time to time by the husbandman as occasion requires; and from the goodness of their rice, the natives are of a stronger constitution than those of Siam or other parts of India. Their fruits are also held to be of a more delicious taste than the fruits of other countries which are exposed to floods: the plains here are covered with the cotton shrub which bears a red flower, and when the flower falls, it leaves a head about as big as a walnut, from whence the cotton is drawn; and that which comes from Macassar is accounted the finest in India. Of all their plants, opium is what they most admire; it is a shrub which grows at the bottom of mountains, or in stony ground: the branches

branches afford a liquor which is drawn out much after the same manner as palm wine, and being stopped up close in a pot, comes to a consistency, when they make it up in little pills: they often dissolve one of these pills in water and sprinkle their tobacco with it; and those who are used to take it can never leave it off: they are lulled into a pleasing dream, and intoxicated as with strong liquor; but it insensibly preys upon their spirits and shortens their lives: they will take the quantity of two pins heads in a pipe of tobacco, when they enter into a battle, and become almost insensible of wounds or danger till the effect of it is worn off.

The natives of this island are famous for the poisons they compound of the venomous drugs and herbs their country produces; of which, it is said, the very touch or smell occasions present death: their young gentlemen are instructed how to blow their little poisoned darts through a tube or hollow cane, about six feet in length; with these they engage their enemies; and if they make the least wound with these darts, it is said to be mortal. Though these weapons would not be much dreaded among people that are well clothed, yet as the natives engage naked, their skins are easily penetrated, and the poison operates so speedily, that it is not easy to cure them: they will strike a man with these darts at near an hundred yards distance.

Macassar, the chief city here, is situated on the banks of the river of the same name, near the S. W. corner of the island. Here the Dutch have a very strong fort, mounted with a great number of cannon; and the garrison consists of 800 men. The streets of the town are wide and neat, but not paved, and trees are planted on each side of them. The palaces, mosque, and great houses are of stone, but the houses of the meaner sort of wood of various colours, which make them look very beautiful, but are built on pillars like those of Siam, and the roofs like theirs also are covered with palm or cocoa leaves. Here are shops along the streets, and large market places, where a market is held twice in 24 hours, viz. in the morning before sun-rise, and an hour before sun-set, where only women are seen; a man would be laughed at to be found amongst them: from all the villages you see the young wenches crowding to market with flesh, fish, rice and fowls; they abstain only from pork, which their religion forbids. Upon a computation of the number of inhabitants, in this city and the neighbouring villages, some years ago, they amounted to 160,000 men able to bear arms; but now are not half that number, many of them having forsaken their country since the Dutch deprived them of their trade. The rest of the towns and villages were once equally populous, but are now many of them deserted. The people of Macassar have excellent memories, and are quick of apprehension, they will imitate any thing they see, and would probably become good proficients in all arts and sciences, if they did not want good masters to improve their talents.

They have also strong robust bodies, are extremely industrious, and as ready to undergo fatigues as any people whatever: nor are any people more addicted to arms and hardy enterprises, inasmuch that they may be looked upon as almost the only soldiers on the other side the bay of Bengal; and accordingly are hired into the service of other princes and states on that side, as the Swiss are in this part of the world: even the Europeans frequently employ them in their service, but have sometimes suffered by trusting them too far; or rather, our people being too apt to use them like slaves, as they do the poor Portuguese and Mustees in their service; this is a treatment which the Macassarians will not bear, and never fail to revenge whenever it is attempted by our European governors.

The people of Macassar are of a moderate stature, their complexions swarthy, their cheek-bones stand high, and their noses are generally flat; the last is esteemed a beauty, and almost as much pains taken to make them so in their infancy, as to make the Chinese ladies have little feet.

They have shining black hair, which is tied up and

covered with a turban, or cloth wound about their heads when they are dressed, but at other times they wear a kind of hat or cap with little brims.

They continually rub and supple the limbs of their infants with oil, to render them nimble and active; and this is thought to be one reason there is hardly ever seen a lame or crooked person among them.

Their male children of the better sort, it is said, are always taken from their mothers at six or seven years of age, and committed to the care of some remote relation, that they may not be too much indulged and effeminated by the caresses of the mother: they are sent to school to their priests, who teach them to write and read and cast accounts, and the precepts of the koran: their characters very much resemble the Arabic, which is not strange, since their ancestors, many of them, were Arabians.

Besides their books, every child is bred up to some handicraft trade; they are also taught several sports and martial exercises, if they are of quality; but the meaner sort are employed in husbandry, fishing, and ordinary trades, as in other places.

This people seem to be inspired with just notions of honour and friendship, and there are instances of many of them who have exposed their lives even in defence of foreigners and Christians; and of others who have generously relieved and maintained people in distress, and even suffered them to share their estates. They retained that love of liberty, that they were the last of the Indian nations that were enslaved by the Dutch, which did not happen neither till after a long and very expensive war, wherein almost the whole force of the Hollanders in India was employed. The people in general are very much subject to passion; and they will condemn their own rashness if they are in the wrong.

The women are remarkable chaste and reserved, at least they cannot help appearing so; for the least smile or glance on any but their husbands, is held a sufficient reason for a divorce: nor dare they admit of a visit even from a brother, but in the presence of the husband: and the law indemnifies him for killing any man he shall find alone with his wife, or on whom she has conferred any mark of her favour. But the inhabitants of this country are in general so little addicted to infamous practices, or litigious disputes, that they have neither attorneys or bailiffs among them. If any differences arise, the parties apply personally to the judge, who determines the matter with expedition and equity. In some criminal cases, such as murder, robbery, &c. he has a right to execute justice himself, by destroying the offender. On the other hand, the man keeps as many wives and concubines as he pleases, and nothing can be more ignominious than the want of children, and the having but one wife: the love of women, and the desire of children is universal; and according to the number of women and children the man possesses his happiness is rated.

To proceed; though the women of fashion generally keep close, yet upon certain festivals they are suffered to come abroad and spend their time in public company, in dancing and other diversions used in the country; but the men do not mix with them as in this part of the world, only they have the happiness to see and be seen, which makes them wait for this happy time with impatience.

Their princes and great men wear a garment made of scarlet cloth or brocaded silk, with large buttons of gold, they have likewise a very handsome embroidered sash made of silk, in which their dagger and purse are placed, with their knife, crice, and other little trinkets. People of figure dye the nail of the little finger of the left-hand red, and let it grow as long as the finger. The women wear a muslin shift, or rather waistcoat, close to their bodies, and a pair of breeches, which reaches down to the middle of the leg, made of silk or cotton, and have no other head dress than their hair tied up in a roll, with some curls hanging down their necks; they throw a loose piece of linen or muslin over

all when they go abroad; nor have they any ornaments but a gold chain about their necks. They are fond of a fine equipage and a great number of servants to attend them, and if they have not so many of their own as their quality requires, they will not stir out, till they have got the usual number, by hiring or borrowing them. The furniture of their houses consist chiefly of carpets and cushions, and the couches they sleep on. They sit cross-legged on mats and carpets, as most Asiatics do.

This island produces most animals except sheep. There are monkeys and baboons in abundance, that will set upon travellers; some of them are quite black, some of a straw colour, and others white, the latter of which are generally as big as mastiffs, and much more mischievous than the others. Some have long tails, and walk on all-fours; others are without tails, and walk upright, using their fore-feet as hands, and in their actions greatly resemble the human species. Their going in large companies secures them from the more powerful beasts of the forests; but they are sometimes conquered by the large serpents, which pursue them to the tops of trees, and destroy them.

The natives do not scruple eating any flesh but pork, this no Mahometan will touch; but their food is chiefly rice, fish, herbs, fruit and roots; flesh they eat but little of. They have but two meals a day, one in the morning, and the other about sun-set; but their chief meal is in the evening; they chew betel and areka, or snuke tobacco mixed with opium most part of the day. Their liquor is tea, coffee, sherbet, or chocolate, and they have palm wine, arrac, or spirits, which they sometimes indulge in, though it is prohibited by their religion. They loll upon carpets at their meals, and eat off of dishes made of China, wood, silver or copper, which are set on little low lacquered tables; and take up the rice with their hands instead of spoons, which they seem not to know the use of. In the celebration of marriage the husband receives no other portion with his wife than the presents he received before marriage. As soon as the priest has performed the ceremony, the new-married couple are confined in an apartment by themselves for three successive days, having only a servant to bring them such necessaries as they may have occasion for, during which time their friends and acquaintances are entertained, and great rejoicings made at the house of the bride's father. At the expiration of the three days the parties are set at liberty, and receive the congratulations of their friends; after which, the bridegroom conducts his wife home, and both apply themselves to business, he to his accustomed profession, and she to the duties belonging to housewifery, and the management of a family. When a man has reason to suspect his wife of infidelity, he applies to a priest for a divorce; and if the complaint appears just, there is no difficulty in obtaining it. In this case the secular judge pronounces the accused party guilty, declares her to be divorced, and settles the terms; both parties, after this judgment, have liberty to marry again.

The Macassarians had originally strange notions of religion: they believed there were no other gods but the sun and moon; and to them they sacrificed in the public squares, not having materials which they thought sufficiently valuable to be employed in erecting temples. According to their creed, the sun and moon were eternal, as well as the heavens, whose empire they divided between them. These absurdities, however, had not so lasting an influence either over the nobles or people, as is found from the religious doctrines of other nations; for the Turks and apostles of the koran arriving in the country, the sovereign and his people embraced Mahometanism, and the other parts of the island soon followed their example. They are great pretenders to magic; and carry charms about them, supposing these will secure them from every danger. When any one is so ill as to be given over by the physician, the priests are sent for, who, attributing the violence of their disease to the influence of some evil spirit, first pray to them, and then write the names of God and Mahomet

on small pieces of paper, which are carefully hung about their necks; and if the patient does not soon recover, his death is considered as inevitable, and every preparation is made for his expected departure. These people perform their funeral ceremonies with great decency; to secure which, the meanest person makes provision while in health, by assigning a certain sum to defray the necessary expences attending it. As soon as a person is dead, the dead body is washed, and, being clothed in a white robe, is placed in a room hung with white, which is scented with the strongest perfumes. Here it continues for three days, and on the fourth it is carried on a palanquin to the grave, preceded by the friends and relations, and followed by the priests, who have attendants that carry incense and perfumes, which are burnt all the way from the house to the grave. The body is interred without a coffin, there being only a plank, at the bottom of the grave for it to lie on, and another to cover it: and when this last is placed, the earth is thrown in, and the grave filled up. If the person is of any distinguished quality, a handsome tomb is immediately placed over the grave, adorned with flowers, and the relations burn incense and other perfumes for 40 days successively.

This island was formerly under a monarchial government; and in order to prevent the crown falling to an infant, the eldest brother succeeded after the death of the king. All places of trust in the civil government were disposed of by the prime ministers; but the officers of the revenue and of the household were appointed by the sovereign. The king's forces, when out of actual service, were not allowed any pay, but only their cloaths, arms, and ammunition. It is said, that in former wars he has brought 12,000 horse, and 80,000 foot into the field; but the last war with the Dutch, proved the total destruction of both king and country; since which, this island has been under the government of three different princes, who are constantly at variance with each other; which is a favourable circumstance for the Dutch, who might otherwise meet with a powerful opposition, and be deprived of those advantages they have so long possessed on this side the globe. These princes hold assemblies at particular times on affairs that concern the general interest; and the result of their determinations becomes a law to each state. When any contests arises, it is decided by the governor of the Dutch colony, who presides at the above diet. He keeps a watchful eye over these different sovereigns, and holds them in perfect equality with each other, to prevent any of them from aggrandizing themselves to the prejudice of the company. The Dutch have disarmed them all, under pretence of hindering them from injuring each other, but in reality only to keep them in a state of subjection.

Jampadan is another port-town about 15 miles south of Macassar River, one of the best harbours in India, and the first town the Dutch took from the natives; here they sunk or seized all the Portuguese fleet when they were in full peace with that nation. The rest of the towns and villages lying in the flat country near the sea or the mouths of rivers, are for the most part built with wood or cane, and stand upon high pillars on account of the annual flood, when they have a communication with one another only by boats.

About the Celebes are several islands that go by the same name, the principal of which is situated about five leagues from the S. E. corner. This island is about 80 miles long, and 30 broad: on the east-side of it is a large town and harbour called Callacassong, the streets of which are spacious, and enclosed on each side with cocoa trees. The inhabitants are governed by an absolute prince, speak the Malayan tongue, and are Mahometans. The straits of Patience are on the other side of this island; they are so called from the great difficulty in passing them, which arises from the violence of the currents, and the contrariety of the winds.

II. *Of the situation, trade, and produce of Borneo, Sumatra, and Java, commonly called the Sunda Islands; and of the manners and customs of the inhabitants, &c.*

THE most considerable of the Sunda Islands, called so from the straits near which they lie, are Borneo, Sumatra and Java.

Borneo extends from 7 deg. 30 min. N. latitude, to 4 deg. S. latitude, and from 107 to 117 degrees of longitude, being about 700 miles in length and 500 in breadth, and is computed to be 2500 miles in circumference. The figure of this island being almost round, it probably contains a greater number of acres than any island hitherto discovered. To the eastward of it lies the island of Celebes or Macassar, to the south the island of Java, to the west the island of Sumatra, and to the N. E. the Philippine Islands.

The air of this country is not excessive hot, considering it is situated under the equinoctial, being refreshed almost every day with showers and cool breezes, as all other countries that are under the line; but as those parts of the island which border on the sea-coast lie upon a flat for several hundred miles, and are annually flooded; upon the retiring of the waters, the whole surface of the ground is covered with mud or soft ouze, which the sun darting its rays perpendicularly upon, raises thick noisome fogs, which are not dispersed till nine or ten in the morning, and render those parts of the island very unwholesome. The multitude of frogs and insects that the waters leave behind, and are soon killed by the heat of the sun, cause an intolerable stench also at that time of the year, and corrupt the air: add to this the cold chilling winds and damps which succeed the hottest days; from all which, we may conclude it must be very unhealthful, at least to European constitutions: and the loss of our countrymen, who yearly travel thither, sufficiently convinces us of this truth. As to their monsoons, or periodical winds, they are westerly from September to April, or thereabouts; during which time is their wet season, when heavy rains continually pour down, intermixed with violent storms of thunder and lightning; and at this time it is very rare to have two hours fair weather together on the south coast of the island, whither the Europeans principally resort. The dry season begins usually in April and continues till September; and in this part of the year too, they seldom fail of a shower every day, when the sea breeze comes in.

The harbours of greatest note, and to which the Europeans usually resort, are Banjar Masscen, Succadanea and Borneo, but much more to Banjar Masscen than either of the other; the greatest quantities of pepper growing towards the source of that river, which falls into the sea 3 deg. 18 min. S. latitude. The town of Banjar formerly stood about 12 miles up the river, and was built partly on wooden pillars, and partly on floats of timber in the river; but there is now no sign of a town there, the inhabitants being removed to Tatas, about six miles higher.

The city of Borneo, formerly the residence of the principal sultan or king of the island, lies on the N. W. part of the island, in 4 deg. 55 min. N. latitude, and is a very commodious harbour. This city is very large, the streets spacious, and the houses well built; they are in general three stories high, covered with flat roofs, and the sultan's palace is a very elegant and extensive building. It is the chief seat of commerce in the island, and the port is continually crowded with ships from China, Cambodia, Siam, Malacca, &c. The English and Portuguese have some trade here, though no settled factory. The port of Succadanea lies on the west-side of the island, in 15 min. S. latitude, and was heretofore more resorted to by the Europeans than any other. Over against this, on the east-side of the island, stands another sea-port town, called Passair, in 15 min. S. latitude, but is not a place of any great trade.

One of the most considerable inland towns is Caytonge, the sultan whereof is now the most potent prince in the island; this city lies about 100 miles up the river

Banjar; and about 200 miles higher stands the town of Negaree, the residence of another sultan. The names of the other principal towns are Tanjongbuoro, Sedang, Tanjongdatoo, Sambas, Landa, Pisagadan, Cotapang Sampit, Tanjong, Selatan, Gönwarengen and Po-manooacan.

Their chief rivers are, 1. Banjar. 2. Tatas. 3. Java. 4. Succadanea; and, 5. Borneo.

Banjar is a fine river, rising in the mountains in the middle of the island, and, running south, discharges itself into a bay on the S. E. part of the island, being navigable for several hundred miles; the banks are planted with tall ever-green trees. The river Tatas falls into the mouth of Banjar River, and is frequently called the China River, because the China junks lie in the mouth of it. The rivers Java and Succadanea run from the N. E. to the S. W. and fall into the bay of Succadanea in the S. W. part of the island.

The river Borneo falls into the bay of Borneo, in the N. W. part of the island. The tides in the river Banjar flow but once in 24 hours, and that in the day-time; they never rise more than half a foot in the night (unless in a very dry season) which is occasioned by the rapid torrents, and the land winds blowing very strong in the night-time. There lie three islands within the entrance of the river, the first of which is covered with tall trees, that may be seen at sea, and are a good mark for sailing over the bar. If a ship be aground, the ebb is so very strong, occasioned by the land floods, that she will run the hazard of being broke to pieces; and the trees continually driving down the river, render the navigation still more dangerous. The best anchoring place is a mile or two within the river; it is best to fail up with the flood, the tide of ebb runs so strong. There are a great many fine bays and harbours on the coast, but that most resorted to is at the mouth of the river Banjar.

The natives of Borneo consist of two different people, that are of different religions; those upon the sea coast are usually called Banjareens, from the town of Banjar, to which most nations resort, to trade with them. The Banjareens are of a low stature, very swarthy, their features bad, resembling much the negroes of Guinea, though their complexion are not so dark; they are well proportioned, their hair is black, and shines with the oil with which they perpetually grease it. The women are of a low stature and small limbs, as the men are, but their features and complexion much better, and they move with a good grace. The lower class of people go almost naked; they have only a little bit of cloth before, and a piece of linen tied about their heads. Their betters, when they are dressed on days of ceremony, wear a vest of red or blue silk, and a loose piece of silk or fine linen tied about their loins, and thrown over their left shoulder. They wear a pair of drawers, but no shirt, and their legs and feet are bare; their hair is bound up in a roll, and a piece of muslin or callico tied over it; they always carry a crice or dagger in their sash when they go abroad. The Byaios or mountaineers are much taller and larger bodied men than the Banjareens, and a braver people, which their situation and manner of life may account for, being inured to labour, and to follow the chase for their daily food; whereas the Banjareens use very little exercise, travelling chiefly by water. The Byaios have scarce any clothing, but, not admiring their tawny skins, paint their bodies blue, and, like all other people that live in hot climates, anoint themselves with oil, which smells very strong; and the better sort, it is said, pull out their fore-teeth, and place artificial ones, made of gold, in their stead; but their greatest ornament consists of a number of tygers teeth, which are strung together, and worn about the neck. Some of them are very fond of having large ears; to obtain which, they make holes in the soft parts of them when young; to these holes are fastened weights about the breadth of a crown piece, which is continually pressing on the ears, and expand them to such a length, as to cause them to rest upon the shoulders. The

The Banjareens are an hospitable friendly people, where they are not abused, or apprehend foreigners have a design upon their liberties; they seem to be men of good sense, but not being acquainted with the world, are frequently imposed upon in their traffic with the crafty Chinese. The chief part of their food here is rice, as it is in other hot countries, but with it they eat venison, fish, or fowl, and almost all kind of meat, except hogs flesh; and men of figure are served in gold or silver plate; the common people are content with brass or earthen dishes, and all sit cross-legged upon mats or carpets at their meals, and indeed almost all day long, chewing betel and arek, or smoaking tobacco, which both sexes are very fond of when it is mixed with opium. The whole company usually smoke out of one pipe; the master of the feast having smoaked first, passes it round the company, and they will sometimes sit smoaking so long, that they grow stupid. At other times they divert themselves with comedies, and the Chinese have taught them to game; their rural sports are hunting, shooting, and fishing. They have such plenty of fish, that they may take as many as will serve them a day at one cast, from their houses, which are built upon floats in their rivers. Their usual salute is the salam, lifting up their hands to their heads, and bowing their bodies a little; and before their princes, they throw themselves prostrate on the ground: no one presumes to speak to a great man, till he is first spoken to, and required to tell his business: they usually travel in covered boats upon their rivers; but the great men who live in the inland country ride on elephants or horses. Besides rice, already mentioned, the produce of this country is cocoa-nuts, oranges, citrons, plantains, melons, bananas, pine-apples, mangoes, and all manner of tropical fruits; cotton, canes, rattans, and plenty of very fine timber; gold, precious stones, camphire, bezoar, and pepper. There are three sorts of black pepper; the first and best is the Molucca, or lout pepper; the second is called Caytonge pepper, and the worst sort is the Negaree pepper, of which there is the greatest plenty. This is small, hollow and light, and commonly full of dust, and the buyer will be imposed on if he buys it by measure, and does not weigh it. He must take care also, that the pepper be not mixed with little black stones, which are not easily seen. The white pepper grows on the same tree as the black pepper does, and bears twice the price: it is conjectured to be the best of the fruit that drops of itself, and is gathered up by the poor people in small quantities, before it turns black, and the scarcity of it occasions it to be so dear; but we seem to want a more satisfactory account of this matter.

The animals here are the same as on the continent of India, viz. bears, tygers, elephants, buffaloes, deer, &c. but the most remarkable animal, and which is almost peculiar to this island, is that monstrous monkey called the oran-outang, or man of the woods, near six feet high, and walks upon his hinder legs. He has a face like a man, and is not so ugly as some of the human species, particularly the Hottentots; he has no tail, or any hair on his body, but where a man has hair. Mr. Beeckman, captain of an Indiaman, purchased one of them, who would drink punch, and open his case of brandy to get a dram, if he was left alone with it, drink a quantity, and then return the bottle to the case. He would lay himself down to sleep as a man does: if the Captain appeared angry with him, he would whine and sigh till he was reconciled. He would wrestle with the seamen, and was stronger than any of them, though he was not a year old when he died; for the Captain lost him as soon as he came into cold weather, having been bred in the hottest climates.

Among their minerals is gold, which the mountaineers get out of the sands of their rivulets in the dry season, and dispose of it to the Banjareens, from whom the Europeans receive it: there are also iron mines, and the load-stone is found here.

The principal articles of merchandize imported from Borneo by the Europeans, are pepper, gold, diamonds,

camphire, bezoar, aloes, mastick and other gums; and the goods proper to be carried thither, besides bullion and treasure, are small cannon from 100 to 200 weight, lead, callimancoes, cutlery wares, iron bars, small steel bars, hangers, the smallest sort of spike nails, twenty-penny nails, grapplings of 40 pounds weight, red leather boots, spectacles, clock-work, small arms with brass mountings, horse pistols, blunderbusses, gun-powder and looking-glasses. The purchasing gold is a profitable article, and diamonds may be had reasonably, though they are generally small ones: they usually purchase gold with dollars, giving a certain number of silver dollars for the weight of one dollar in gold. The current money is dollars, half and quarter dollars; and for small change they have a sort of money made of lead in the form of rings, which are strung on a kind of dry leaf.

The language of the inhabitants on the coast is the Malayan; but the islanders have a language peculiar to themselves, and both retain the superstitious customs of the Chinese. They are intirely ignorant of astronomy; and when an eclipse happens, they think the world is going to be destroyed. Arithmetic they know but little of; and their only method of calculating, is, by parallel lines and moveable buttons on a board. They have likewise little knowledge of physic; and the letting of blood, how desperate soever the case of the patient may be, is to them a circumstance of a very alarming nature, as they suppose, by the operation, we let out our very souls and lives. It is their opinion, that most of their distempers are caused through the malice of some evil demon; and when a person is sick, instead of applying to medicine, they make an entertainment of various kinds of provisions, which they hold under some conspicuous tree in a field; these provisions, which consist of rice, fowl, fish, &c. they offer for the relief of the person afflicted; and if he recover, they repeat the offering, by way of returning thanks, for the blessing received; but if the patient dies, they express their resentment against the spirit by whom he is supposed to have been afflicted. Both Pagans and Mahometans allow a plurality of wives and concubines; and the marriage ceremonies of both are the same as in other Mahometan countries. The girls are generally married at the age of ten, and leave child-bearing before they are twenty-five. The women are very constant after marriage; but are apt to bestow favours with great freedom when single; and however indiscreet they may have been in this point, they are not considered the worse for it by their husbands, nor dare any one reproach them for what they have committed previous to their marriage. They in general live to an advanced age, which is attributed to their frequent use of the water; for both men and women bathe in the rivers once in the day; and from this practice they are very expert swimmers. In burying their dead, they always place the head to the north, and they throw into the grave several kinds of provisions, from an absurd and superstitious notion that these may be useful to them in the other world. They fix the place of interment out of the reach of the floods; and the mourners, as in Japan and China, are dressed in white, and carry lighted torches in their hands.

In the inland part of this country, are several petty kingdoms, each of which is governed by a rajah, or king. All the rajahs were formerly subject to the rajah of Borneo, who was esteemed the supreme king over the whole island; but his authority has been of late years greatly diminished; and there are other kings equal, if not more powerful than himself; particularly the king of Caytonge. The town where this prince resides is situated about 80 miles up the Banjar River. His palace is a very elegant building erected on pillars, and is open on all sides. Before the palace is a large building, consisting only of one room, which is set apart for holding councils, and entertaining foreigners. In the centre of the room is the throne, covered with a rich canopy of gold and silver brocade. About the palace are planted several cannon, which are so old, and

mounted on such wretched carriages, that they are neither ornamental nor useful. This prince is esteemed the greatest, on account of the customs he receives at the port of Banjar Massén, which are estimated at 8000 pieces of eight per annum. The king or Sultan of Negaree is the most considerable prince, next to the above: his palace is situated at a place called Metapoor, about 10 miles from Caytonge. There is a handsome armoury before the gates of his palace, which contains a great number of fire-arms, and several cannon. He is always on good terms with his neighbour the prince of Caytonge, and the rest are subordinate to these two princes; great homage is paid them by the natives, and it is difficult for a stranger to get access to them: the only means to effect this, is, by complimenting them with some valuable present, for avarice is their darling passion; and the stranger will be treated with respect in proportion to the present he makes.

Sumatra is one of the Sunda Islands, situate in the Indian ocean, between 93 and 104 deg. of eastern longitude, and between 5 deg. 30 min. N. latitude, and 5 deg. 30 min. S. latitude, the equinoctial line running cross the middle of it; having Malacca on the N. Borneo on the E. Java on the S. E. and the Indian ocean on the west, and is 800 miles long, and about 150 broad. The air is generally unhealthful near the coast, the country being very hot, and very moist, and changing suddenly from sultry heat in the day-time, to cold chilling winds in the night. It is the first of the remarkable islands that form the great Archipelago of the east, the entrance of which is, as it were, blocked up by this island and Java, which form a barrier separating the Indian from the Chinese ocean; except that in the center between the two islands there is an opening, which appears as if purposely designed to admit a free passage for the advantages of commerce. This opening is called the strait of Sunda, the south part of which is the north of Java, and called Java Head; and the north point is the south of Sumatra, called Flat Point. These two are about six leagues asunder, between which ships pass from Europe directly to Batavia or China, without touching at the Indies: they stretch away east from the Cape of Good Hope, and make no land till having traversed the whole Indian sea they arrive at Java Head.

In Sumatra are no physicians, but they rely upon the skill and experience of some good old women, who are acquainted with the nature of their simples. The flux is the distemper that usually carries off foreigners, against which the fruit guava and the pomegranate are certain remedies, if taken before the distemper becomes violent; but most other fruits promote the disease. Bathing in cold water is esteemed another remedy for the flux. Their water, unboiled, as well as sherbet, is very unwholesome; full meals of flesh ought to be avoided, occasioning a distemper called the Mort Duchin, which is attended with a violent vomiting and purging, and usually carries off the patient in 24 hours. Those gentlemen that drink strong liquors to excess, usually avoid the flux, but are carried off by fevers. The cholic and small-pox are often fatal to the natives, as well as foreigners; but they are seldom troubled with dropries, gout, or stone. People who are careful of their health, eat and drink moderately, and boil their water; nor do they avoid wine or arrack punch altogether, for these drunk moderately in this moist air preserve, rather than destroy health.

There is a chain of mountains which runs the whole length of the island, from the N. W. to the S. E. and here the air is something better than on the coast; but the European factories are generally situated at the mouths of rivers near the sea, for conveniency of trade; and here three years may be reckoned a long life, the salt stinking outfe sends up such unwholesome vapours as perfectly poison foreigners that are sent thither. The monsoons, or periodical winds, shift here at the equinoxes, as they do in other parts of the Indian seas, blowing six months in one direction, and six months in the opposite direction; and near the coast there are other periodical winds, which blow the greatest part of the

day from the sea, and in the night-time and part of the morning from the land; but these scarce extend seven miles from the coast. Here is also a mountain called Single-diamond, about 40 miles S. E. of Bencoolen, which is a mile in height perpendicular; the rocks near the west coast are generally barren, producing little besides shrubs; but towards the bottom of them grows some good timber. The country has a great many small rivers, but none of them navigable much above their mouths, falling from high mountains, and discharging themselves precipitately into the sea, either on the E. or W. after a very short course; the rains continuing here, as they do in most places near the equinoctial, six months and upwards, every year, and nowhere with more violence. The waters of the river Indapoor, during rains, look red for two miles beyond the mouth out at sea, occasioned, it is said, by the great number of oaks that grow in their boggy grounds, and are almost covered when the floods are highest. The waters of all their rivers, which overflow the low countries, are very unwholesome, foul, and not fit to be drunk till they are settled, nor indeed till they have been boiled, and tea or some other wholesome herbs infused into them; and this, no doubt, is one cause of the unwholesomeness of the air, it being a very just observation, that wherever the water is bad, the air is so too.

The island of Sumatra was antiently, and is at present, divided into a great many kingdoms and states, of which Achen is the most considerable, whose king is the most powerful monarch in the island, the north part of it being in a manner subject to him. Besides this prince, there are several orancayas, or great lords, in this kingdom, who exercise sovereign authority in their respective territories; but they all acknowledge the king of Achen their superior, and accept of the great officers in his court. In former times the kings have exercised such despotic power as to displace some of these, and depose others; and, on the other hand, instances have been known where these princes have deposed the king, and placed another on the throne. There have been frequent struggles between the king of Achin and these princes for sovereign power; and if the former has in some reigns been absolute, he has in others had a very limited authority. The king has the power of disposing of the crown, during his life, to such of his children as he thinks proper, whether born of a wife or a concubine: but if the king does not dispose of it in his life time, there are sometimes several competitors for it; and he who is most favoured by the orancayas, or vassal princes, usually carries his point; so that the crown is elective in these cases.

Achen, the metropolis of the kingdom of the same name, is situated at the N. W. end of Sumatra, in 93 deg. 30 min. E. longitude, and in 5 deg. 30 min. N. latitude, and is much the most considerable port in the island. It stands in a plain, surrounded with woods and marshes, about five miles distant from the sea, near a pleasant rivulet: it is an open town, without wall or moat, and the king's palace stands in the middle of it, being of an oval figure, about half a league in circumference, surrounded by a moat 25 feet broad, and as many deep: and about the palace there are cast up great banks of earth instead of a wall, well planted with reeds and canes, that grow to a prodigious height and thickness, insomuch that they cover the palace, and render it almost inaccessible; these reeds also are continually green, and not easily set on fire. There is no ditch or draw-bridge before the gates, but on each side a wall of stone about ten feet high that supports a terrace, on which some guns are planted; and a small stream runs through the middle of the palace, which is lined with stone, and has steps down to the bottom of it, for the conveniency of bathing. There are four gates, and as many courts, to be passed before we come to the royal apartments; and in some of these outward courts are the king's magazines, and the standings of his elephants: as for the inward courts of the palace, foreigners, or even the natives, hardly ever approach them.

them; and therefore a just description of these is not to be expected. But notwithstanding the fortifications of this palace or castle, as it is sometimes called, are very mean and inconsiderable, yet the avenues to it are naturally well defended; for the country round about Achen is full of rivulets, marshes, and thick woods of cane or bamboo, which are almost impenetrable, and very hard to cut: there are several little forts erected also at proper distances in the marshes, where guards are planted to prevent any surprize. In the king's magazines, some authors tell us, are found a numerous artillery, and a good quantity of fire-arms, and that his guards consist of many thousand men; but that his greatest strength is in his elephants, who are trained up to trample upon fire, and stand unmoved at the report of a cannon; but this we shall examine more particularly when we come to speak of the maintenance of the prince, both with respect to domestic and military supplies, for later travellers do not seem to admire his power or grandeur. The city consists of 7 or 8000 houses, which take up the more ground because they are not contiguous, every person surrounding his dwelling with a pallisado pale that stands some yards distant from it; except in two or three of the principal streets where the markets are kept, and where foreigners inhabit, who chuse to live near one another, to defend themselves from thieves, robberies being very common here. The harbour which is so large as to be capable of containing any number of the largest ships, is commanded by a spacious fortress encompassed with a ditch well fortified according to the Italian manner, and mounted with cannon. The English, Dutch, Danes, Portuguese, Guzarats, and Chinese, are the chief traders in this city. The king has a great number of horses, which, as well as the elephants, have rich and magnificent trappings. He is at no expence in times of war, for all his subjects are obliged to march at their own expence, and carry with them provisions for three months: he only furnishes them with arms, powder, lead, and rice, which is very trifling. In peace, it does not cost him any thing, even for the maintenance of his family, for his subjects supply him with all kinds of provisions: they also provide him and his concubines with cloaths. He is heir to all his subjects who die without issue male, and to all foreigners who die within his territories; and succeeds to the estates of all those who are put to death. From all which it appears, that the revenue of this prince, though not paid in money, is very considerable.

The inhabitants of Achen are more vicious than in other places on the coast: they are proud, envious, and treacherous; despise their neighbours, and yet pretend to have more humanity than the inhabitants of any other nation. Some of them are good mechanics, especially in the building of galleys; and they are very dexterous in doing all kinds of smiths work: they also work well in wood and copper, and some of them are skilled in making artillery. They live very abstemiously, their chief food being rice, to which some of the better sort add a small quantity of fish, and their usual drink is water. They are very fond of tobacco, though they have but little of their own raising; and for want of pipes, they smoke in a bunco, in the same manner as the inhabitants on the coast of Coromandel. The bunco is the leaf of a tree, rolled up with a little tobacco in it, which they light at one end, and draw the smoke through the other till it is nearly burnt to the lips. These rolls are very curiously formed, and sold in the public markets in great quantities.

They hold a court of justice five times a week, for determining all matters of controversy, in which one of the chief orancayas presides as judge. There is also a criminal court, where cognizance is taken of all quarrels, robberies, murders, &c. committed in the city: and there is a third court, in which the cadi, or chief priest, presides, who judges concerning all infringements of an ecclesiastical nature. Besides these, there is a court for determining disputes between merchants, whether foreigners or natives. An exact account is kept here of all the customs, gifts, fines, and commodities, belong-

ing to the king, with a list of all the persons who buy of his majesty, pay the duty, or make presents to him. Offenders are brought to a speedy trial, and the punishment is inflicted immediately after their conviction. If the offence be of a trifling nature, the punishment for the first time is the loss only of a hand or foot, and the same for the second; but for the third, or if they rob to a considerable amount, they are impaled alive. When the hand or foot is to be cut off, the limb is laid on the edge of a broad hatchet, and the executioner strikes it with a large mallet till the amputation is perfected; and then they put the stump into a hollow bamboo stuffed with rags or moss, to prevent the criminal from dying by loss of blood. After he has thus suffered whether by the king's command, or by the sentence of the judge, all the ignominy of his crime is wiped off; and if any one upbraids him with it, he may kill him with impunity. Murder and adultery are punished with death; and, in this case the criminal has many executioners, he being placed amidst a number of people, who stab him with their daggers; but female offenders are put to death by strangling. The king is frequently a spectator of these punishments, and sometimes even acts as executioner: and though such a spectacle must to a feeling mind, appear extremely shocking, yet so little does he seem affected by it, that instances have been known of his executing a criminal, and immediately after entertaining himself with cock-fighting; a diversion which in this country is more universally esteemed than any other.

Having given the situation of the most considerable places on the east-side of Sumatra, we proceed through the straits of Sunda to the west-coast; and advancing from thence towards the north, the first English settlement we meet with is Sillabar, which lies in a bay at the mouth of a large river of the same name, in 4 deg. S. latitude. Here the English have a residence, or a small detachment from Marlborough fort. (erected soon after the destruction of York Fort at Bencoolen) to receive the pepper the natives bring hither. Ten miles to the northward of Sillabar stands the town of Bencoolen, where was the principal settlement the English had upon the island Sumatra, from the year 1685 to the year 1719, when there happened a general insurrection of the natives, who cut off part of the garrison; the rest escaping in their boats to sea.

Bencoolen is known at sea by a high slender mountain that rises 20 miles beyond it in the country, called the Sugar-loaf. Before the town of Bencoolen there lies an island, within which the shipping usually ride; and the point of Sillabar extending two or three leagues to the southward of it, makes a large bay; besides these marks the old English fort, which fronted towards the sea, might have been discerned when a ship came within seven or eight miles of the place. The town is almost two miles in compass, and was inhabited chiefly by the natives, who built their houses upon bamboo pillars, as in other parts of the island. The Portuguese, Chinese, and English had each a separate quarter. The Chinese people built all upon a floor, after the custom of their country. The English houses were after their own model; but they found themselves under a necessity of building with timber, (though there was no want of brick or stone), upon account of the frequent earthquakes. The adjacent country is mountainous and woody, and in some parts are volcanoes that frequently vomit fire. The air is very unwholesome, and the mountains are generally covered with thick clouds that burst in storms of thunder, rain, &c. The soil is a fertile clay, and the chief produce is grass; but near the sea it is all a morass. There is a small river on the N. W. side of the town, by which the pepper is brought here from the inland part of the country; but there is a great inconvenience in shipping it, on account of a dangerous bar at the mouth of the river. The road is also dangerous for ships, as it has no other defence from the violence of the sea during the S. W. monsoons, than a small place called Rat Island, which, with the land point of Sillabar, makes the haven.

The

The pepper brought here comes from the territories of the two-neighbouring rajahs, one of whom resides at Sindle-démond, at the bottom of a bay 10 or 12 miles to the north; and the other of Bafar, 10 miles to the east. There two rajahs have houses in the town, whither they come when they have any business to transact with the English, who pay them half a dollar duty for every 560 pounds weight of pepper; and they also pay to the owner for every such quantity 10 Spanish dollars, weighing each 17 penny weights and 12 grains.

The English have also other settlements to the N. W. of the above, particularly at Cattoun, situated about 40 miles from Bencoolen; Ippo, about 30 miles farther to the north; Bantall, which is upwards of 100 miles north of Bencoolen; and Mocho, situated a little to the south of Indrapour. There are likewise several good Dutch settlements on this island, the most considerable of which is Pullambam, or Pullamban, situate about 120 miles N. E. of Bencoolen. The chief article of trade here is pepper, of which the Dutch have prodigious quantities, being under contract with the king of Pullamban, and other Indian princes, to take it at a certain price, one half of which they pay in money, and the other in cloth. All other nations are prohibited from trading except the Chinese, by means of whom the English get a share of their pepper, as our ships pass through the straits of Banca. The Dutch formerly carried on a great trade here in opium; but as that was found to impoverish the country, by drawing away its ready cash, the king, in 1708, ordered only three chests of about 160 pounds each, to be imported; and that if any should be detected in acting contrary to this order, they should forfeit not only their goods, but their lives also.

Pullambam is a very large town, and pleasantly situated on the banks of a fine river, which divides itself into several branches that run by four channels into the sea. It continued to be a considerable city till the year 1659, when it was destroyed by the Dutch, in revenge for some injuries they pretended to have received from the natives. About this time the Dutch reduced the chief of the kingdoms in the south part of this island; but several of them were afterwards recovered by the natives, who have ever since remained independent. The Dutch have several other factories here; namely, (1.) Bancalis, situated nearly opposite to Malacca, on the banks of a spacious river of its own name. The chief articles sold by the company here are, cloth and opium; in return for which, they receive gold-dust. The country is very fertile, and in the woods and mountains are prodigious numbers of wild-hogs, whose flesh is exceeding sweet and fat. They have likewise some good poultry, and there are various kinds of fish in the river. (2.) Siack, situate on the river Andraghima: this is a very inconsiderable place, on account of the unwholesomeness of the air, which is attributed to the great number of shads caught in the river at a particular season of the year, for the sake of the roes; and the rest of the fish being thrown in heaps, corrupt, and exhale pestilential vapours. These roes the natives pickle, and then dry in smoke; after which they put them in large leaves of trees, and then send them to different countries between Achen and Siam. They call it Turbow, and reckon it a great delicacy. (3.) Pedang, which is situated about 60 miles south of the equator, and has a fine river, where large ships may come up, and ride in safety; but it is the most insignificant settlement the Dutch have on this island: it produces but a small quantity of pepper; and the trade in gold is so trifling, as hardly to defray the natural expences attending it. Many other places on this island are independent of the English and Dutch; the chief of which are the following.

Priaman, it lies nearly opposite to Pedang, about 100 miles N. W. of Indrapour. It is very populous, and plentifully supplied with most kinds of provisions. The natives carry on a considerable trade with the inhabitants of Manimcabo. The Dutch had a factory here for many years, but were at length driven from it by the king of Achen.

Ticow, another very considerable place, which is situated about seven leagues from Daffaman, in 20 deg. S. latitude. The inland part of the country is very high; but that next the sea is low, covered with woods, and watered with several small rivers, which render it marthy. There are, however, many pleasant meadows well stocked with buffaloes and other horned cattle, which are purchased at a very easy price. It likewise affords plenty of rice, poultry, and several sorts of fruits, as durians, ananas, oranges, citrons, pomegranates, melons, mangoes, cucumbers, and potatoes: but its most valuable produce is pepper, with which it abounds, and is in quality esteemed superior to that of any other place on the island. The pepper chiefly grows at the bottom of the mountains; for which reason those parts are exceedingly populous. The city stands about two miles from the sea, opposite to a small island. It is but a little mean place, for the city and suburbs do not contain 800 houses, which are chiefly built with reeds, and are neither strong or commodious. The king is subject to the kings of Achen, who appoints a new governor every three years, and without him the king of Ticow cannot execute any business of importance. The governor, therefore, is the person applied to by foreigners in the transacting of business, and even the natives pay him the most distinguished respect. The inhabitants of the city are Malaysians, but the inland parts are possessed by the natives, who disown the king of Achen's authority, and have a peculiar language and king of their own. This part of the country produces great quantities of gold, which the natives exchange with the Dutch, or the inhabitants near the coast, for pepper, salt, iron, cotton, red-cloth, and Surat pearls. The air here is very unhealthy, particularly from July to October, and the people are very subject to fevers, which are so violent in their nature, as seldom to admit of a cure; so that were it not for the pepper, no stranger would venture to go near them. Every person who trades to this place, must have a licence for that purpose from the king of Achen; and when that is obtained, they cannot be interrupted either by the king or governor of Ticow. They sell their pepper by bahars of 116 pounds avoirdupois: and the king of Achen has 15 per cent. out of all that is sold, that is, seven and a half for the export of the pepper, and seven and a half for the import of the merchandize given in exchange for that commodity.

Barras, which belongs to the king of Achen, is one of the most considerable places on the west coast; it is situated on a fine river near the center between Ticow and Achen, and, like the former, no person must trade here without permission from the king. This place produces great plenty of gold, camphire, and benjamin, the latter of which serves the natives instead of money. The country is very pleasant, and abounds with rice, and several sorts of the most delicious fruits. The Dutch and English, as also the inhabitants of the coast, buy up the camphire here, in order to carry it for Surat, and the straits of Sunda.

The province of Andzigzi is small, but remarkable for producing great quantities of pepper: and gold is cheaper here than in any other part of the island.

Jamly is situated on a river on the east-side of the island, about 50 miles from the sea, in 2 deg. S. latitude. Great quantities of pepper are produced in it, which is said to be much superior in quality to that of Andrigri. The Dutch had a factory here, the most considerable of all their settlements on the coast, but they withdrew from it in 1710. The English had likewise a factory near it, which they also quitted on account of the obstructions they met with from the Dutch in their trade.

Pedir is situated about 30 miles east of Achen, and is a large territory; it has the advantage of an excellent river. The soil is very fertile, and the country produces such quantities of rice, that it is called the granary of Achen. It also produces a large quantity of silk, part of which is wove by the natives into stuffs, that are valued in most parts throughout the island.

island, and the rest is sold to the inhabitants of the coast of Coromandel.

Pallaiman, almost under the equinoctial, is a large place, situated at the foot of a very high mountain, but is remarkable only for producing pepper, which is both large and excellent in its quality.

Cinquale produces annually a large quantity of camphire, which the inhabitants of Surat, on the coast of Coromandel, purchase for 15 or 16 rials the coss, or 28 ounces. Daya abounds in rice and cattle.

In the island of Sumatra, they have a small breed of horses; they have also buffaloes, deer, goats, hogs, tigers, hog-deers, monkeys, squirrels, guanoes, porcupines, alligators, serpents, scorpions, muskatoes, and other insects: from the hog-deer is obtained a species of the bezoar-stone, which is of a dark brown colour, and has two coats; a small quantity of this stone, dissolved in any liquor, will remove an oppression of the stomach, rectifies foul blood, and restores the appetite: it is also very efficacious in other disorders incident to human nature. Here are also hens, ducks, and other poultry; pigeons, doves, parrots, parakeets, macaws and small birds; sea and river fish also are very plentiful, and turtle or sea tortoise. They have elephants, but they are supposed not to be natives. Rice is much the greatest part of their food in all their meals: strong soup, made of flesh or fish, and a very little meat high seasoned, serves to eat with their rice. The Mahometans that inhabit the coast, abstain from swine's flesh, and from strong liquors, as they do in all countries of the same faith. The mountaineers will eat any flesh, except beef, the bull being one of the objects of their worship, and if we could give any credit to their neighbours, the people of Achen, they eat human flesh; but the world is pretty well satisfied by this time that there are no nations of cannibals. Their common drink is tea, or plain water; but they sometimes use the liquor of young cocoa-nuts, which is very cooling and pleasant. They always sit cross-legged on the floor at their meals. Their salutations are much the same as in other Asiatic countries.

Learning is not to be expected here. The common language is the Malayan tongue, and the koran and religious books of the Mahometans are written in Arabic, which is now a dead language. They have indeed the use of letters here, as they have almost in every other eastern nation except China; but those gentlemen were so self-sufficient, so much above being taught by people they look upon as their inferiors, that they have now the least pretence to learning of any nation on the face of the earth. The Mahometans of Sumatra speak and write the Malayan language. The Pagan mountaineers have a language peculiar to themselves. As the Malayans write from the right-hand to the left, the mountaineers write as we do, from the left-hand to the right; and instead of pen, ink, and paper, they write, or rather engrave, with a stile on the outside of a bamboo cane; the Malays, indeed, use ink and a coarse brown paper. Both nations are poor accomplices, and are forced to make use of the Banians that reside amongst them as their clerks, when they have any considerable accounts to make up, the Banians being said to be possessed of great abilities in this particular, and are also some of the sharpest traders in the world.

The inhabitants of this island are in general of a moderate stature, and a very swarthy complexion: they have black eyes, flat faces, and high cheek bones: their hair is long and black, and they take great pains to dye their teeth black: they likewise besmear themselves with oil, as in other hot countries, to prevent being stung by the insects; and let their nails grow exceedingly long, scraping them till they are transparent, and dyeing them with vermilion: the poorer sort go almost naked, having only a small piece of cloth fastened round the waist; and about their heads they wear a piece of linen, or a cap made of leaves, resembling the crown of a hat; but they have no shoes or stockings. The better sort wear drawers, or breeches, and a piece of cal-

lico or silk wrapped about their loins, and thrown over the left shoulder, and they wear sandals on their feet, when in towns. They are very proud and revengeful in their dispositions; and are so indolent, that they will neither endeavour to improve themselves in arts and sciences, or in husbandry, but suffer their manufactures to be neglected, and their lands to lie without cultivation. If foreigners, therefore, were not to supply their defects, they would in all probability suffer themselves to be reduced to a savage state, and only preserve their existence, like the beasts of the country, with what the earth spontaneously produces. The king has no other standing forces than his guards, but depends on his militia, which, as we hinted above, are as numerous as the people in his kingdom, all who are able to bear arms, are obliged to appear under arms whenever they are summoned. They have scarce any fortified towns and castles, but what are natural; and the country seems to be so inaccessible, that the natives boast it has never been conquered by any foreign power; but this must be a mistake, for the present generation, who are masters of the north part of the island and the sea-coast, are not the original inhabitants, but came from Egypt and Arabia, and having driven the Pagans up into the mountains, succeeded them on the sea-coasts. The religion of Mahomet is professed at Achen, and upon all the coasts of Sumatra; but they are not such bigotted zealots as they are in some other Mahometan countries. Their temples or mosques are but meanly built, some of them no better than cottages. The chief priest resides at Achen, and has a great influence on affairs of state. Their marriage contracts are made before their priests, who are judges in cases of divorce, as well as in civil causes. Their priests also assist at their celebration of their funeral rites, as in other Mahometan states.

This, as well as the rest of the Indian islands, was, no doubt, first peopled from the neighbouring continent. The Phœnicians, Egyptians, and Arabians afterwards trafficked with them; and we find Solomon desiring Hiram, king of Tyre, to send him skilful mariners to pilot his fleet into these seas; and the Ophir mentioned in scripture, is supposed to be this very island, from whence he fetched his gold. The Arabians and other nations bordering on the red-sea, afterwards planted colonies here, and became so potent, that they drove the former inhabitants up into the mountains, and possessed the coast. The Portuguese found the descendants of those nations fixed on the shores of the Indian continent as well as the islands when they arrived there. The Portuguese enjoyed the sole traffic with this and the adjacent islands for near 100 years, viz. from the year 1500 almost to the year of our Lord 1600, when other nations followed them round the Cape of Good Hope, and put in for a share of the Indian trade. Some writers assure us, that this kingdom has been ever governed by queens; others affirm that there never was a queen regent here; we may, however, take the middle way, and allow that it has been subject both to kings and queens: certain it is, a king was upon the throne when we first visited this island, because we have his letter which he wrote to queen Elizabeth, and kings have of late years filled that throne.

The inhabitants of the mountains are governed by the chiefs of their respective tribes, who are under a necessity of maintaining a good correspondence among themselves in order to defend their country against their powerful neighbours; for as they are possessed of all the gold the island produces, there is no doubt but the Mahometan princes that lie round them, would make an effort to subdue those golden mountains, if their princes were at variance: or if they did not, the Dutch would find a way to their gold, if they should find their chiefs divided: for the Dutch are possessed of several strong places and countries in the island, which would be supported in such an enterprise by fleets and forces from Batavia and Malacca, that lie but a very little distance from them.

The coins of the country are, first cash, or pieces of lead, 1500 of which make one mas, valued at 15 pence, which is a gold coin. A pollum or copang is a quarter of a mas, 16 mas is one tael, which is an imaginary coin, and equivalent to 20 shillings sterling; dollars and other Spanish coins also are current here. With respect to their weights, five tael, make a buncal, 20 buncals one catty, and 100 catty one pecul, being 132 pounds English; three peculs are a China bahar of 396 pounds China weight; and of Malay weight, at Achen 422 pounds 15 ounces, and at Bencoolen, and the rest of the western coast, a bahar is 500 pounds great weight, or 560 pounds English. They make their payments at Achen oftener in gold pieces than in coin.

Several other islands belong to Sumatra, among which is one called by the inhabitants Pulo Lanchakay, and, by the natives of Achen, Pulo, Lada, or the island of Pepper. This is a large island, situated in 6 deg. 15 min. N. latitude. In the centre of it are two high mountains separated from each other by a very narrow valley; and at the foot of these mountains is a plain at least 12 miles in length. Pepper is produced in it; but the island is very thinly inhabited. The soil of the plain is well calculated for all kinds of drugs, fruit, rice, and cattle; and, as it has several good springs and rivers, it might produce excellent pasturage; but the inhabitants only attend to the cultivation of pepper, that being the article which turns out most to their advantage. The other parts of the island are covered with thick woods, in which are some remarkable strait and lofty trees. The winds are westerly from the beginning of July to the end of October, during which time they have very heavy rains; and the climate, as in other parts of the same latitude, is very unwholesome. The island at present produces 500,000 pounds weight of pepper annually, which is said to be preferable to that of any other place in the Indies. The inhabitants are Malaysians, but are naturally better disposed than those of Achen; their habits are much the same in make, but not so elegant: they are very zealous Mahometans, and in their customs and ways of living differ little from the inhabitants of Achen.

The island of Lingen is situated about 60 miles N. E. of Jamby, and about the same distance to the S. E. of Johore. It is 50 miles in length, and 10 in breadth: the interior part of it is very mountainous, but that next the sea lies low, and is very fertile. It produces pepper and canes, and in some parts of it are great numbers of porcupines. That of Banca is very large, being at least 150 miles in length, and about 20 in breadth. The natives, like most of the Malaysians, are treacherous, and very inhospitable to such strangers as unfortunately happen to be shipwrecked on the coast. At the mouth of the straits of Banca is Lucipara, a small island but so barren, that it has but few inhabitants, and only produces a small quantity of pepper. There are several other small islands belonging to Sumatra, most of which are either uninhabited, or so insignificant as not to merit a particular description.

Java, one of the Sunda islands, is situated in the Indian ocean, between 102 and 113 degrees of east longitude, and between 5 and 8 degrees of south latitude, being 700 miles long, and upwards of 100 broad, having the island of Borneo on the north, the straits of Bally on the east, the Indian ocean on the south, and the straits of Sunda (from whence it is called one of the Sunda Islands) on the N. W.

The air of Java, near the sea, is generally unhealthful, unless where the bogs have been drained, and the lands cultivated; there it is much better, and in the middle of the island much more so. The worst weather upon the north coast of Java is during the westerly monsoon, which begins the first week in November, when they have some rain. In December the rains increase, and it blows fresh, and in January it blows still harder, and the rains continue very heavy till the middle of February, when both the wind and rains become more moderate and decrease, till the end of March. Their fair season commences

in April, the winds are then variable, and it is sometimes calm, only at the change of the moon there are sudden gusts of wind from the west. In the beginning of May the eastern monsoon becomes constant, and in June and July there is a little rain; but in this monsoon they have generally clear, wholesome weather, until the end of September. In October the easterly wind blows faintly, and in November the westerly monsoon sets in again: when the westerly wind and currents are strongest here, namely, in December, January and February, there is no sailing against them. The easterly winds and currents are more moderate; ships may sail against this monsoon, and a ship may come from the westward through the straits of Sunda to Batavia almost at any time. There is good anchorage on the Java side, in 20 or 30 fathoms water: near the coast of Java and Borneo, from April to November, they have land and sea breezes from different points; the wind blows from the land between one and four in the morning, and continues till noon; at one or two in the afternoon it blows fresh from the sea for five or six hours.

A chain of mountains runs through the middle of the island from E. to W. which are covered with fine woods. It is said these mountains produce great quantities of gold; but the natives conceal it from the Europeans. The most distinguished of these mountains is called the Blue Mountain. The low lands are flooded in the time of the rains. Along the north coast of Java are fine groves of cocoa-nut trees, and wherever we see one of these groves, we do not fail to meet with a village of the natives.

The island was antiently divided into abundance of petty kingdoms and states, and when admiral Drake visited this island in his voyage round the globe, in the year 1579, he relates there were five kingdoms in it. We may now divide it into two parts, 1. The north coast, which is under the dominion of the Dutch; and, 2. The south coast, subject to the kings of Palamboan and Mataram. Bantam was, till lately, the most considerable kingdom of Java, but this king is now a vassal to the Dutch. We shall here give some account of that city.

Bantam, once the metropolis of a great kingdom (till the Dutch destroyed it, and deposed the king,) is seated in a plain at the foot of a mountain, out of which issues three rivers, or rather one river dividing itself into three branches, two whereof surround the town, and the other runs through the middle of it. The circumference of this city, when in its glory, was not less than 12 miles, and very populous. It lay open towards the land; but had a very good wall to the sea, fortified with bastions, and defended by a numerous artillery; and the palace, or rather castle, where the king resided, was no mean fortification; besides which there were several public buildings and palaces of the great men, which made no ordinary figure in this country. It was also one of the greatest ports in the eastern seas, to which all nations resorted, but is now become a wretched poor place, and has neither trade or any thing to render it desirable. The principal inhabitants are removed, and the buildings ruined, their king deprived of his sovereignty, and become a vassal to the Dutch.

Batavia, by the Indians named Jacatra, and by the natives and Chinese Calacka, or Calappa, as they call the fruit of the cocoa-trees, (which are very common here, and said to be superior to any in the Indies) lies in 6 deg. S. latitude, longitude from London 106, and stands about 40 miles to the eastward of Bantam; it is situated at the bottom of a fine bay, in which there are 17 or 18 small islands, which break the violence of the winds and waves; insomuch that 1000 sail may ride here very securely. Two large piers runs out half a mile into the sea, between which 100 slaves are constantly employed, in taking up the mud and soil which is washed out of the town, or the mouth of the river would be soon choaked up. The city of the same name stands in a flat country, and is almost square, and about the bigness of Bristol, regularly built like the towns in Holland.

Holland, but with white stone. Their streets are wide and strait, and in 12 or 15 of the principal are canals, faced with stone, and planted with ever-greens: the sides of the streets also are paved, and over their canals are reckoned no less than 56 stone bridges; after which description there cannot be much occasion to tell the reader that the place is extremely pleasant, and that travellers are surprized with its beauty. It is surrounded with a good wall, and 22 bastions well furnished with cannon, and so contrived as to be of equal service against an insurrection in the city, as against a foreign enemy; the guns being easily brought to point down the principal streets.

The houses are plain, but very neat, and behind them are large gardens well stocked with herbs and vegetables, and most kinds of fruit. They have several handsome public buildings, such as the great church: the stadthouse, the hospitals, the spin-house or house of correction, the pest-house, Chinese hospital, the house of artisans, &c. And there are two churches built for the reformed Portuguese, and another for the Malays; but they do not allow either the Papists or Lutherans the public exercise of their religion. The fort stands upon the west side of the city, and commands both the town and road: it is very large, and has four royal bastions faced with stone, but has no moat except the canals, which lie at some distance from the rampart, may have been mistaken for moats: they are about 25 feet broad, and fordable in most places; the inside of the fort is crowded with buildings, there being the general's house, as well as the houses of most of the principal officers, and companies servants: in the middle of the city there is a large square, which serves as a parade for the garrison, on the west-side of which stands the great church, on the south the stadthouse, on the north a fine range of buildings, and on the east is one of their great canals: there are also several spacious market-places in the city. The suburbs reach almost half a league into the country, and form a town larger than the former but not so compact: being intermixed with kitchen gardens and orchards. Here the Chinese chiefly live, and here they have their temples and burying places, and the free exercise of their religion, which is denied the Lutheran protestants. In this part of the town also live the Malays, and native Javans, and other nations, which the Dutch have transplanted from Banda, Amboyna, &c. There are small forts erected every way, at two or three leagues distance from the town, to defend the avenues; the Dutch being conscious that the king of Mataran and the natives would lay hold of any opportunity of repossessing themselves of their country, and driving the Hollanders from their coasts, however they may seem to acquiesce and tacitly consent, according to the modern phrase, to be insulted and tyrannized over by the Dutch, there is not a nation in India but would gladly throw off the yoke, and declare in behalf of liberty, and for any prince who should come to their relief.

The people who inhabit the city and suburbs of Batavia being formed of various nations, who all preserve the dresses, modes, and customs of their respective countries, they consequently exhibit a very strange appearance; we shall therefore, for the information of our readers, give a particular description of them.

The Chinese do not only drive the greatest retail trade here, but are many of them good mechanics; they also generally farm the fishery, excise and customs, and apply themselves to husbandry and gardening; to manure and cultivate the rice, cotton, and sugars which grow in the fields, about Batavia and other great towns; and exceeding the Dutch, it is said, in their thriftiness, as well as in cozening and over reaching those they deal with. They dress in a vest and gown of silk or callico, after the fashion of their country, and wear their hair wound up in a roll, on the hinder part of the head, and fastened with bodkins; for which every one pays a certain tribute to the Dutch. The Dutch company allow some privileges to the Chinese; for they have not only a governor of their own nation, who manages their affairs, but are also allowed a representative in the council.

They bring tea and porcelain hither from China; but they who are employed for this purpose, must not continue on the island longer than six months. They have singular maxims in the interment of their dead; for they will never open the same grave where any one has been buried; their burial grounds, therefore, in the neighbourhood of Batavia, cover a prodigious space of ground, for which the Dutch make them pay large sums. In order to preserve the body they make the coffin of very thick wood, not with planks fastened together, but cut out of a solid piece like a canoe; the coffin, being covered and put into the grave, is surrounded with a kind of mortar about eight inches thick, which in time becomes as hard as stone. A great number of weeping women, hired on purpose, attend the funeral, besides the relations of the deceased. In Batavia, the law requires that every man should be buried according to his rank; so that if the deceased has not left money sufficient to pay his funeral expences, an officer takes an inventory of his goods, which are sold, and out of the produce he buries him in the manner prescribed.

The greatest merchants here are the Dutch, who are also very good mechanics; they keep the chief inns and most places of public entertainment. They pay two reals a month for their licence, and 70 for every pipe they sell of Spanish wine: but these inn-keepers are far from being obliging to their guests, and particularly to foreigners. Here are also great numbers of Portuguese; and in order to distinguish them from other Europeans, they are called by the natives Oran-serante, or Nazarene men. They in general speak the Malayan language, but some of them a corrupt dialect of the Portuguese; and they have all renounced their religion, by professing the principles of Luther. They are chiefly employed in the most servile offices: some of them are handicraftsmen, others get their living by hunting, and the greatest number by washing linen. They have so closely followed the customs and manners of the Indians, that they are only distinguished from them by their features and complexion, their skin being considerably lighter, and their noses not so flat; and the manners of adjusting their hair constitutes the only difference in their dress. Most of the inhabitants have very tawny complexions. The Malays wear a short coat with strait sleeves, and a cloth about their loins, binding their temples with a piece of linen, in which they enclose part of their hair, the rest hanging down. The women wear a waistcoat and a cloth about their waist, which reaches half way down their legs, and serves instead of a petticoat; they wear nothing but their hair on their heads, and go bare-foot. The men get their living by fishing, and have some retail trade, though not comparable to the Chinese. They profess the Mahometan religion; but are naturally very profligate, and will not scruple to commit crimes of the most infamous nature.

The Amboyne wear vests, and wrap a piece of callico several times about their heads, the ends whereof hang down. Their women only wrap a piece of callico about their loins, throwing part of it over their breasts and shoulders, their legs and arms bare; the men are most of them carpenters, and some of these, as well as of the other nations, the Dutch enlist in their troops, being esteemed brave bold fellows, but given to mutiny, as the Dutch relate, by which they probably mean, they are not yet reconciled to slavery. Their houses are made of wood, and covered with branches of trees; they are pretty lofty, and the floors are divided into separate apartments, so that one house will contain several families. The native Javane wear a kind of skull cap, but their bodies are naked to the middle, wrapping a piece of silk or callico about their loins, which reaches below the middle of their legs, which are bare. The women cover their bodies with a piece of silk or callico, and have another piece wrapped about their loins, and dress in their hair. The men are employed in husbandry and fishing, or in building country boats. There is likewise a mixed breed, called

called Topasses or Mandikers, consisting of several nations, incorporated with the Dutch, and have greater privileges than the rest. Many of these are merchants, and differ but little in their habits, or way of life from the Dutch, only the men wear large breeches or trowsers, which reach down to their ankles. The women tie up their hair in a roll on their heads, wear a waistcoat, and a petticoat of silk or callico, which reaches down to their feet. These live both in city and suburbs, their houses are several stories high, built of brick or stone, and very neatly furnished within. The Macassars, whose ancestors possessed the island of Celebes, and were enslaved by the Dutch, though they went almost naked in their mother country, wear cloathing here. Several of the Timoreans, inhabitants of an island of East China, having been brought hither by the Dutch, now constitute part of the people of Batavia. The habits and customs of these and of the Macassars, are nearly the same: their chief employment is husbandry and gardening. As many of them profess Christianity, and are conformable to the Dutch in their religion and customs, it is to be presumed they clothe themselves as the Hollanders do. Some of the negroes here are pedlars, and hawk about the streets glass-beads and coral; others follow mechanical trades; but the most considerable of them deal in free-stone, which they bring from the neighbouring islands. These people are chiefly Mahometans. All the inhabitants enjoy liberty of conscience; but they are not allowed to exercise their different modes of worship. Priests and monks are permitted to live here, but they are prohibited from being publicly seen in the respective habits of their priestly orders.

As the women of Java are remarkable for their amorous disposition and constancy to the man they espouse, and expect that the man should be equally constant, if her lover goes astray, she makes no scruple to prepare a dose for him. An old traveller, who seems much enamoured with the Javanese ladies, gives this description of them: he observes that they are much fairer than the men, have good features, little swelling breasts, a soft air, sprightly eyes, a most agreeable laugh, and a bewitching mien, especially in dancing: that they express the greatest submission to their husband, prostrating themselves before him when he enters the house. Polygamy prevails here; the Javanese have several wives besides female slaves, of whom they make concubines when they see fit. There being a scarcity of European women, the Dutch are allowed to marry a native, provided she will profess Christianity, which she is seldom averse to, as it gratifies her pride; a Christian and the wife of a Dutchman taking place of a native Javanese, and being allowed a great many privileges, which the natives cannot enjoy; and her husband is obliged to confine himself to her bed, and bring no rivals into the family.

Rice is the principal grain that grows here. They have also plantations of sugar, tobacco, and coffee: their kitchen gardens are well replenished with cabbages, purslain, lettuce, parsley, fennel, melons, pumpions, potatoes, cucumbers, and radishes. Here are also all manner of Indian fruits, such as plantains, bananas, cocoas, ananas, mangoes, mangosteens, durions, oranges of several sorts; limes, lemons, the betel and arek nut; gums of several kinds, particularly benjamin: in March they plant rice, and their harvest is in July. In October they have the greatest plenty of fruit, but they have some all the year. They have good timber, cotton, and other trees proper to the climate, besides oak, cedar, and several kinds of red wood. The cocoa-tree is very common, which is of universal use, affording them meat, drink, oil and vinegar; and of the fibres of the bark they make them cordage; the branches cover their houses, and they write on the leaves with a steel stile, and with the tree, and the great bamboo cane, they build their houses, boats and other vessels. Here are buffaloes and some oxen, and a small breed of horses. The few sheep we find here have hair, rather than wool, and their flesh is dry. Their hogs, wild and

tame, are the best meat we find there, or in any other countries between the tropics; and their venison is good: here are also tygers and other wild beasts, crocodiles, porcupines, serpents, scorpions, locusts, and a multitude of insects. Monkeys of various kinds are found here, also flying squirrels; and a remarkable animal called jackoa; it is almost like a lizard, is very malicious, and darts its urine at every thing which offends it: the urine is of such a quality, that it will canker the flesh, and if the part is not immediately cut out, the object on which it falls must immediately perish. Few accidents, however, happen from this creature, as it always gives notice of its situation from the singularity of its voice, so that the natives, as well as animals, have an opportunity of escaping it. The food, salutations, and diversions of the Indians in this island, are the same as in Borneo and Sumatra, and therefore need not to be repeated here. The Dutch travel in coaches, and on horseback, and sometimes in pelanquins, or covered couches, carried on men's shoulders, as the Indians do, with a grand retinue. Not any of the nations of Europe are suffered to trade to Java, but from China 14 or 15 junks of 200 or 300 ton, used to come every year in November or December, and return home in June; which furnished the Dutch with the merchandize of China upon easier terms than they could purchase it in that country: and this is the reason the Dutch so seldom visit that kingdom, and permit other nations to trade thither, which they could prevent if they pleased, by shutting up the straits of Sunda and Malacca, which the squadrons of men of war they always keep in India, enable them to do. Besides the goods imported to Batavia by the Chinese, the Dutch themselves import the produce of Japan, the Spice Islands, Persia, Surat, Bengal, the coast of Coromandel and Malabar, and all the merchandize of Europe and Africa. Never were such magazines of goods laid up in any city, as are to be found in Batavia, except in Amsterdam itself; and as they barter the goods of one country for another, the Indian trade is so far from diminishing their treasure, that it brings them in more gold and silver than any other traffic.

The Dutch governor of Batavia takes great state upon him, and has in reality the power of a sovereign prince. A troop of horse-guards precede his coach when he goes out, halberdiers surround the coach, and a company of foot-guards march after it, cloathed in yellow satin, enriched with silver lace and fringe; and the governor's lady has her guards, and is attended in all respects, both within and in public, with a dignity equal to that of a queen. The most considerable officer next to him is the director-general, whose business is to purchase such commodities as are brought to the port, and to dispose of such as are taken from it. He is sole master of all the magazines, and has the supreme direction of every thing that relates to the commercial interest of the company.

Batavia being a place of the greatest trade in India, the customs must be very considerable; more especially as the inhabitants are in general wealthy, and almost every article is subject to a duty. The taxes are paid monthly; and to save the charge and trouble of gathering them, on the day they become due a flag is displayed on the top of a house in the center of the town, and all parties are obliged immediately to pay their money to the proper officers appointed to receive the same. The money current here consists of several sorts; as ducats, which are valued at 132 stivers; ducatoons, at 80 stivers; imperial rix-dollars, at 60; rupees of Batavia, at 30; schellings, at six; double cheys, at two stivers and an half; and doits, at one-fourth of a stiver. Some of these coins are of two sorts, though of the same denomination, namely, milled and unmilled, the former of which is of most value; a milled ducatoon is worth 80 stivers, but an unmilled one is not worth more than 72. All accounts are kept in rix-dollars and stivers which are here merely nominal coins; like our pounds sterling. The Dutch, besides their land forces, which are very numerous, have men of war sufficient to engage any fleet.

fleets they are likely to meet with on the Indian seas: and from their great strength and importance in this part of the globe, they assume the title of "Sovereigns of all the seas, from the Cape of Good Hope eastward, to Cape Horn in America."

Cherebon is situate about 80 miles east of Batavia: it is a place of considerable extent, and where the Dutch have a factory. The country is very fertile, and produces most kinds of provisions, particularly rice. The inhabitants are under the dominion of four great lords, called sultans, one of whom is particularly attached to the Dutch, and for that reason is distinguished from the rest by the name of the company's sultan. The rest, indeed, may not be undeserving of the like epithet, as they are in alliance with the Dutch, whose friendship they endeavour to preserve, and whom they consider as their sole protectors; for had it not been for them, these petty princes would have been reduced to the subjection of the king of Bantam, who made inroads on their district, but was repulsed by the interposition of the Dutch. Since this circumstance, the sultans have testified their gratitude by granting many distinguished privileges to their protectors in these dominions. The chief person belonging to the Dutch factory here is called the resident, who corresponds with the governor-general of Batavia, but is solely independant of any other officer. Here is a good fort, where the Dutch have a garrison consisting of 80 men; about a mile and a half from which is a large temple containing the tombs of several of the princes of Cherebon. It is a lofty building of variegated stones, and very elegantly ornamented within. The generality of their priests reside near this temple, the whole order of whom are treated with the most distinguished respect by the inhabitants. We shall now proceed to the description of Palamboan and Mataram, the latter of which is subject to the Dutch.

Palamboan, the capital of the kingdom of that name, is situate in 114 deg. of E. long. and in 7 deg. 30 min. S. lat. on the straits of Bally, through which the East India ships sometimes pass, when they are homeward bound from Borneo; such ships touch at the town of Palamboan for fresh water and provisions; but the surf often beats with such violence on the shore, that makes it difficult watering there. This kingdom, which is independant of the Dutch, lies at the S. E. end of Java, in a pleasant country, watered with several rivulets, which fall on each side of the town into the neighbouring straits. The rajah, or king of this country, generally resides either at Palamboan, or at a fort 15 miles from the sea. His dominions reach from the east end of Java, 80 miles along the south coast, and about 60 miles from N. to S. but its extent up the country is not known. This kingdom is said to produce gold, pepper and cotton, also rice, India corn, roots, and garden stuff. Their animals are horses, buffaloes, oxen, deer, and goats, and they have great plenty of ducks, geese, and other sorts of poultry. The sovereign and his subjects are Pagans, but there are some Mahometans among them, and a few Chinese.

Mataram, when in its most flourishing state, extended its dominion over the whole island, and even now takes up a considerable part of it: this kingdom was the last in the island which the Dutch reduced under their government; having continued its struggles for independency till the year 1704, when the Dutch took the advantage of an opportunity that offered in a dispute relative to the succession of the crown, between the son and brother of the deceased sovereign. These two rivals produced an universal division in the nation. He who was intitled to the crown by order of succession had so much the advantage over his antagonist, that had it not been for the Dutch, who declared in favour of his rival, he would certainly have possessed himself of the supreme power. After a series of contests, the party espoused by the Dutch at length prevailed: the young prince was deprived of his succession, and his uncle, who was unworthy of the character, assumed the sovereignty. After the death of this prince the company placed the legal heir on the throne, and dictated such

laws to him as they thought best calculated to answer their sinister purposes. They chose the place where his court was to be fixed, and secured his attachment by erecting a castle, in which a guard was kept with no other apparent view than to protect the prince. They employed every artifice to lull his attention by pleasures, made him valuable presents, and soothed him by pompous embassies. From this time the prince and his successors have become mere tools of the company. The necessary protection allowed them by the company consists of 300 horse and 400 foot; but the expences the company are at on this account are amply repaid by the advantages that accrue to them.

The harbours afford docks for building all the small vessels employed in the service; and they are supplied from hence with the chief part of the timber that is used in their respective settlements. Besides these advantages, they are furnished with various productions of the country at stipulated prices, which are so low as to be extremely profitable to them.

This country is in general very fertile, and produces great quantities of rice, as also plenty of fruit. There are also various sorts of animals, particularly horses, sheep, goats, and remarkable large oxen. The rivers abound with fish, and the woods produce great plenty of game; but the most valuable articles in this kingdom are, rice, pepper, cadiang, cotton, yarn, cardamum and indigo; the latter of which is esteemed to be as good in quality as any found in this part of the world. The residence of the king is usually at Mataram, the capital of the kingdom. His palace is a very handsome spacious building, adjoining to which are many good houses belonging to his nobles, who continually wait on him, and the greatest homage is paid him by his subjects in general; for though these princes are vassals, yet they are permitted to live in as great state as when they were independant monarchs; and the orders of the Dutch are always executed in their names. They therefore assume a dignity not inferior to that of the most despotic prince, and when they go abroad, a very distinguished mark of loyalty is bestowed on them.

Japara is the last place of importance that remains to be mentioned in this island; it is situated at the bottom of an eminence called the Invincible Mountain, on the top of which is a fort built of wood. It is a very considerable town, and has a good road secured by two small islands. The English had once a factory here, but they were driven from it by the Portuguese, who at that time were masters of the place. This country produces almost every necessary of life, especially cattle, hogs, and poultry: they have also great plenty of rice, with various sorts of the most delicious fruits; and their waters abound with the best of fish. But the most valuable commodities here are pepper, ginger, cinnamon, and indigo. In the woods and mountains are several kinds of wild beasts, as buffaloes, flags, tygers, and rhinoceros's: the latter of these the natives hunt for the sake of their horns, which are much admired, because they will not contain poison; for they will immediately break to pieces if any such composition is put into them. As to the natives of this country, they very much resemble those of other Indian nations, and have the same kind of customs and ceremonies. They are fond of public diversions, particularly the representation of comedies, which principally consist in singing and dancing; and they are slaves to cock-fighting, that by the large sums they bet, they are frequently reduced to the most abject distress and poverty. They are chiefly of the Mahometan religion, as is also the king, who generally resides at a place called Kattafura, where the Dutch have a fort and garrison. This prince reigns absolute among his subjects, who are very faithful to him, and pay him the greatest homage. Like most eastern monarchs, he is constantly attended by women, and takes as many wives and concubines as he thinks proper. When his courtiers obtain an audience, they approach him with the profoundest humility; and even his priests so much revere him, that some of them go in pilgrimage

pilgrimage to Mecca, to make vows, and pray for his prosperity, and that of his family and government.

The island of Balla, or lesser Java, is only divided from the larger by the straits of Bally, and eastward of this are the islands Lambock, Combava, Flores, Solor, Timor, and several more, upon which the Dutch have forts and settlements, and take the liberty of governing and even transplanting the natives whenever they please, from hence they frequently recruit their troops, and thus make one nation of Indians contribute to keep another in subjection.

Timor is the largest of these islands, being about 200 miles in length, and 50 in breadth, and is divided into several petty states, which the Dutch oppose against one another, and by that means govern the whole. It has not any navigable rivers or harbours, but there are several commodious bays. The Portuguese had formerly colonies here, whose descendants are now so intermixed with the original natives, that they are scarce to be distinguished from them, especially as they profess the same religion. The principal kingdoms in this island are Namquimal, Lortiby, Pobumby, and Amaby; each of which has an independant and absolute sovereign: these have several Rajahs, and other distinguished officers under them; all of whom, with their subjects in general, pay them the greatest homage. Each kingdom has a language peculiar to itself, but the manners and customs of the inhabitants differ but little. There are some Pagans and Mahometans still remaining, and the Chinese come hither to trade once a year; the inhabitants are so very swarthy, that they are sometimes taken for blacks, and those that are not under the government of the Portuguese or Dutch are represented as savages; they wear no clothing but a little piece of cloth about their loins, and the better sort wear a kind of coronet about their temples, adorned with thin plates of gold or silver; the rest have caps made with palmetto leaves. Their arms are swords, darts, and lances or spears, and with these they run down and kill their game. Their animals are the same as in the island of Java, as well as their forest and fruit trees. The Dutch do not seem to make any great profit of these islands; the principal design of their building forts here, is to defend the avenues to the spice islands, which lie in their neighbourhood. On this last mentioned island there is a Portuguese settlement, called Laphao: it is situated by the sea-side, about three leagues to the east of the Dutch fort, called Concordia. It is a very small place, containing only a few mean houses, and a church made of boards, covered with palmetto leaves. There is a kind of platform here, on which are six iron guns; but the whole are so much decayed, as to be rendered almost useless. The people, in general, speak the Portuguese language; and the natives have been so intermixed with the Portuguese by marriages, that it is difficult to know one from the other. Most of them profess the Roman catholic faith; but in the other parts of the island they are either Mahometans or Pagans. The chief trade is carried on at Porta Nova, situated at the east end of the island, and where the Portuguese governor usually resides. Some years ago a pirate attacked, plundered, and then destroyed several of the buildings in this town, with that of Concordia belonging to the Dutch.

Mandura is an island opposite the easternmost point of Java, the most valuable produce of which, for foreign markets, are deer skins. Its principal town is Arabia, situated near a deep bay, about eight leagues from the westernmost land of Java. The soil of this island is very fertile, and produces several sorts of grain, particularly rice; also several kinds of the most delicious fruits. The chief animals are buffaloes, horses, sheep, and oxen, the latter are remarkably large, and the flesh little inferior to those of Europe. Their buildings, maxims, customs, &c. resemble those of other Indian nations: some of them are Mahometans, and others Pagans. The men are in general very robust and courageous, for which reason, when there is any deficiency in the fixed number of the Dutch troops, they recruit from them their forces at Batavia and other settlements.

We now proceed to the continuation of the history of our voyage. By our account the town of Macassar lies in latitude 5 deg. 10 min. and in 117 deg. 28 min. East longitude from London. It is built upon a point, or neck of land, and is watered by a river or two which either run through, or very near it. It seemed to us to be large, and there is water for a ship to come within half a cannon shot of the walls. The country about it is level, and has a most beautiful appearance; it abounds with plantations, and groves of cocoa-nut trees, with a great number of houses interspersed. At a distance inland, the country rises into hills of a great height, and becomes rude and mountainous.

The Bay of Bonthain is large, with good soundings, and a soft bottom of mud; wherein ships may moor with perfect security; nor is there any danger coming in; for the rocks at the entrance are above water, and a good mark for anchoring. The highest land in sight here is Bonthain hill; and a ship in the offing, at the distance of two or three miles from the land, should bring this hill N. or N. half W. and then run in and anchor. We lay right under the hill, at the distance of about a mile from the shore. In this bay are many small towns: Bonthain lies in the N. E. part of it; and the fort which we have mentioned, is intended for no other purpose than to keep the country people in subjection. The Dutch resident has the command of the place, and of Bullocomba, which lies about twenty miles farther to the eastward. There are several small rivers from whence water may be got upon occasion: indeed wood and water are here in great plenty: we cut our wood near the river, under Bonthain hill: our water was procured partly from that river, and partly from another; when from the latter, our boat went above the fort with the casks that were to be filled, where there is a good rolling way; but as the river is small, and has a bar, the boat, after it is loaded, can come out only at high water. Fresh provisions were purchased here, at reasonable rates: the beef is excellent, but not in plenty; but rice may be had in any quantity, as may fowls and fruit. In the woods are abundance of wild hogs, and as the natives, who are Mahometans, never eat them, they may be purchased at a low price. The natives at times, supplied us with turtle; for this, like pork, is a dainty which they never touch. The bullocks here are the breed that have a bunch on their backs. The arrack and sugar that are consumed are brought from Batavia. Celebes is the key of the Molucca or spice islands, which, whoever is in possession of it, must necessarily command: most of the ships that are bound to them, or to Banda, touch here, and always go between this island and that of Solor. The latitude of Bonthain hill is 5 deg. 30 min. S. longitude 117 deg. 53 min. E.

On Sunday the 22nd of May, at day break, we sailed from Bonthain Bay, keeping along shore till the evening, when we anchored in the passage between the two islands of Celebes and Tonikaky; the latter of which, according to our account, lies in latitude 5 deg. 31 min. S. longitude 117 deg. 17 min. E. On the 23d, we weighed, steered to the southward of Tonikaky, and stood to the westward. At three o'clock P. M. we were abreast of the easternmost of three islands, called by the Dutch Tonyn's islands. These make a right angle triangle with each other; the distance between the easternmost and westernmost is eleven miles, and their relative bearings are nearly east and west. At six o'clock, after we had founded and got no ground, we suddenly found ourselves upon a shoal, having not three fathoms water, which, being smooth and clear, afforded us the sight of great crags of coral rocks under our bottom. We immediately threw all our sails aback, and providentially got off without damage. This is a very dangerous shoal, and seemed to extend itself to the southward and westward, all round the two westernmost of these three islands, for near six miles, but about the easternmost island there seemed to be no danger; we observed also a clear passage between this island and the other two. The latitude of the easternmost and westernmost of these islands is 5 deg. 31 min. S. The eastern-

A Draught of

*Situated about 30 Leagues to the
S^E of MACASSAR in the
ISLAND of CÉLEBES.*

most is distant 34 miles due W. from Tonikaky, and the westernmost lies ten miles farther. On the 25th P. M. we found the water much discoloured; soon after we went over the northernmost part of a shoal. Here we found the water very foul when to the southward, but to the northward of us it appeared to be clear. At 11 o'clock we saw to the northward of us, the southernmost islands of Salombo, in latitude 5 deg. 33 min. S. at the distance of eighty-two leagues west of Tonikaky. We must here remark, that off the island of Madura, the winds of the monsoons are commonly a month later in settling than at Celebes. On Thursday the 26th P. M. we saw from the mast head the island of Luback, which is in latitude 5 deg. 43 min. S. and in longitude 5 deg. 36 min. W. of Tonikaky, and distant from thence 112 leagues. To the northward of this island we found a current setting W. N. W. On the 29th we saw the cluster of small islands, called Carimon Java, distant from Luback 45 leagues. The easternmost island is the largest, and is in latitude 5 deg. 48 min. S. longitude 7 deg. 52 min. W. of Tonikaky, from which it is distant about 158 leagues.

Thursday, the 2nd of June, we made that part of the island of Java which makes the easternmost point of the bay of Batavia, called Carawawang. When we first got sight of the land we decreased gradually our soundings, and, having steered along the shore for Batavia, we had thirteen fathoms, in which depth, night coming on, we anchored, in sight of Batavia, near the two small islands called Leyden and Alkmar. On the 3d we came to an anchor in the road, which is so good that it may be considered as a harbour. We thought ourselves happy in having attained our present situation; for with great difficulty we had prevented the Swallow from sinking by the constant working of the pumps, during her whole passage from Celebes. In this road of Batavia we found laying eleven large Dutch ships, besides several that were less, one Spanish ship, a Portuguese snow, and several Chinese junks. On the 4th we saluted with 11 guns, which number was returned; and this being his Majesty's birth day, we afterwards fired 21 guns more on that occasion. In the afternoon captain Carteret waited upon the governor, requesting permission to repair the defects of the ship; but he was directed to petition the council. Accordingly on Monday the 6th when the council met, the captain sent a letter, stating to them the defects of the ship, and requesting permission to repair her; adding that he *hoped* they would allow him the use of such wharfs and store-houses as should be necessary. On the 7th in the afternoon, the shebender, Mr. Garrison, a merchant, as interpreter, and another person, came to the captain, saying, that he was sent by the governor and council for a letter, which they had heard he had received when at Bonchain, that the author of it, who had injured both him and their nation, might be punished. Captain Carteret acknowledged he had received information of a design to cut off the ship, but said, he had never told any one it was by means of a letter. The shebender then desired to know if the captain would take an oath, of his not having received the letter in question; to which the captain returned, that if the council had any such extraordinary requisition to make of him, he desired it might be in writing, and then he would give such a reply, as, upon mature consideration, he should think proper. He then asked the shebender, what answer he had been instructed to give to his letter, concerning the refitting of the ship; to which the shebender replied, that the council had taken offence, at his having used the word *hoped*, all merchants having, upon a like occasion, used the title of *request*; captain Carteret in return said, that no offence had been intended on his part, and that he had used the first words that occurred, which he thought most expressive of his meaning. On the 9th the same gentlemen visited the captain a second time, when the shebender required a writing under his hand, importing, that he believed the report, of an intention formed at the island of Celebes to cut off the Swallow, was false and malicious,

observing at the same time, that he hoped the captain had a better opinion of the Dutch nation, than to suppose them capable of suffering so execrable a deed to be perpetrated under their government. After this altercation Mr. Garrison read a certificate, which, he said, had been drawn up, by order of the council, for captain Carteret to sign. This the captain refused to do, because it appeared to be made a condition of complying with his request respecting the ship. During this conversation, the captain desired to see by what authority the Shebender made his requisition: he replied, he had no testimony of authority, but that of the notoriety of his being a public officer, and the evidence of the gentlemen who were present, who would confirm his declaration, that he acted in this particular by the express order of council. The captain now repeated his request of having the requisition of the council in writing; the Shebender said, he could not do this without an order from his superiors; the captain upon this absolutely refused to sign the paper, and they parted not in very good humour with each other.

On Wednesday, the 15th, the same three gentlemen paid captain Carteret a third visit, informing him, that the council had protested against his behaviour at Macassar, and his refusing to sign the certificate, as an insult upon them, and an act of injustice to their nation. The captain said, he was not conscious of having, in any instance, acted contrary to the treaties subsisting between the two kingdoms, unworthy of his character as an officer, honoured with a commission from his Britannic Majesty, or unsuitable to the trust reposed in him; nor did he think he had been used by the governor of Macassar as the subject of a friend and ally; he then requested, that if they had any thing to alledge against him, it might be reduced to writing, and laid before the king his master, to whom alone he thought himself to be responsible. With this answer they departed; and, the next day, the captain wrote a second letter to the governor and council, in which he represented, that the leaks of the Swallow were every day increasing, and urged, in more pressing terms, his request, that she might be repaired. In consequence of this application, on Saturday the 18th the Shebender informed us, that the council had given orders for the repair of the ship at Onrust, and, as there was no store-house empty, they had appointed one of the company's vessels to receive our stores. The captain inquired of the Shebender whether he had not an answer to his letter; he said he had not; nor was this the usual mode with the council, a message by him, or some other officer, being always thought sufficient. All disputes being now terminated, without any improper compliances on the part of this intrepid commander, he was, after this, supplied for his money with every thing he could desire from the company's stores, and a pilot was ordered to attend us to Onrust, where we came to anchor on Wednesday the 22nd. We immediately began to clear the ship, and put her stores on board the company's vessel. On examination we found the poor weather-beaten Swallow in a very decayed state. Her bowsprit and cap, as well as her main yard, were rotten, and altogether unserviceable, her sheathing was every where eaten off by the worms, and the main planks were so much damaged, that it was absolutely necessary to heave her down, before she could be sufficiently repaired; but the wharfs being at this time pre-engaged by other ships, her repairs did not commence till the 24th of July. When the Dutch carpenters came to examine her bottom, they were all of one opinion, that the whole should be shifted. This the captain strenuously opposed, being afraid, as the Swallow was an old ship, that should her bottom be opened, and found worse than was imagined, she might undergo the fate of the Falmouth, and be condemned: he therefore desired, that a good sheathing, only might be put over all; but the Bawle, or master carpenter, would not undertake the required repairs, unless the captain would certify under his hand, that what should be done was in consequence of his own express orders, judgement,

ment, and direction; which the Dutchman thought was necessary for his own justification; for, said he, should the Swallow never reach England, the blame, if I go according to your directions, will nevertheless consequently fall upon me. This being thought a reasonable proposition, the Captain readily assented to it; but being by this act become responsible for the fate of the ship, he thought proper to have her surveyed carefully by our own carpenter and mate, he himself with his officers always attending. Among other defects, seven chain-plates were useless; the iron work was in a very decayed state; several of the knees were loose, others were broken, and the butt-ends of the planks that joined the stern were so open, that a man's hand might be thrust in between.

During our stay at this port, we found, among other private ships from India, the *Dudley*, from Bengal; and application having been made to the council, leave had been granted to careen her, but as the wharfs had been kept in continual use, she had been put off above four months. The Captain apprehending, that if he suffered a delay much longer, the worms would eat through the bottom of his vessel, applied to our Commander to intercede for him with Admiral Houting, which he did with such success, that a wharf was immediately allotted her. "Admiral Houting," says Captain Carteret, "is an old man, in the service of the states, with the rank of Commander in chief of their marine, and the ships belonging to the Company in India. He received his first maritime knowledge on board an English man of war, speaks English and French extremely well, and does honour to the service both by his abilities and politeness: he was so obliging as to give me a general invitation to his table, in consequence of which I was often with him, and it is with pleasure that I take this opportunity of making a public acknowledgement of the favours I received from him, and bearing this testimony to his public and private merit: he was, indeed, the only officer from whom I received any civility, or with whom I had the least communication; for I found them, in general, a reserved and supercilious set of people." The spirited behaviour of Captain Carteret to the governor at this Dutch settlement, in refusing to pay him an extravagant homage, which is exacted of the Captains of all merchant ships which touch here, deserves also particular notice. The governor of Batavia, although a servant of the republic, assumes the state of a sovereign prince. When he goes abroad, he is escorted by a party of horse-guards, and two black footmen run before his coach, each having a large cane in his hand, with which they take the liberty of chastising those who do not make the obeisance that is expected from persons of all ranks, whether belonging to the country or strangers. In this settlement almost every one keeps a carriage, which is drawn by two horses, and driven by a man upon a box, like our chariots, but is open in front. When any one of these coaches meets that of the governor's, either in the town, or upon the road, it is drawn on one side, and the persons in it must get out to pay their respects, while his excellency's coach goes by; nor, if a coach is behind, must it drive past that of the governor's, however pressing necessity may require speed. A similar homage is likewise required by the members of the council, called *Edele Heeren*, only that the person does not quit his carriage, but standing up in it, pays them a respectful homage. One black man, with a stick in his hand, runs likewise before the coach of every member of the council, nor must any one presume to pass it any more than that of the governor's. It was hinted to Captain Carteret by the landlord of the hotel where he lodged, that his carriage must stop, if he should meet the governor, or any one of the *Edele Heeren*; this ceremony being generally complied with by the captains of Indiamen, and other trading ships; and he intimated, that the *Shebander* had ordered him to give the Captain this information: but our Commander disdaining to pay a degree of servile homage to the servants of the States of Holland, which is not paid

to the king of Great Britain, would not consent to perform any such ceremony; and when the landlord mentioned the black men with their sticks, he pointed to his pistols, which then happened to lie upon the table, and told him, that he would be upon his guard; and should any insult be offered to his person, he knew well how to defend himself: upon this he went out, and in a few hours after told the Captain, he had orders from the governor, to let him know, that he might do as he pleased. We had now been at Batavia between three and four months, and during that time, says Captain Carteret, "I had the honour to see the governor but twice: the first time was at my arrival, when I waited upon him at one of his houses, a little way in the country; the next was in town, as he was walking before his house there, when I addressed him upon a particular occasion. Soon after the news of the Prince of Orange's marriage arrived at Batavia, he gave a public entertainment, to which I had the honour of being invited; but having heard, that Commodore Tinker, upon a like occasion, finding that he was to be placed below the gentlemen of the Dutch council, had abruptly left the room, and was followed by all the captains of his squadron; and being willing to avoid the disagreeable dilemma, of either sitting below the council, or following the Commodore's example, I applied to the governor to know what station would be allotted me, before I accepted his invitation, and finding I could not be permitted to take place of the council, I declined it. On both these occasions I spoke to his excellency by an English merchant, who acted as an interpreter. The first time he had not the civility to offer me the least refreshment, nor did he the last time so much as ask me to go into his house." The ship was now repaired to our satisfaction, though the Dutch carpenters thought she was not in a condition to proceed to Europe; and admiral Houting intimated, that if we went to sea before the proper time, we should meet with such weather off the Cape of Good Hope, as would make us repent our haste; but the Captain being ill, and the people very sickly; and especially as the west monsoon was setting in, during which the mortality is yet greater at Batavia than at other times, we thought it better to run the risk of a few hard gales off the cape, than to remain longer in this unhealthy place.

We therefore, on Wednesday the 15th of September, sailed from Onrust, without returning, as is usual, into Batavia Road, and the Captain, on account of his illness, sent his lieutenant, Mr. Gower, to take leave of the governor, and to offer him his service, if he had any dispatches for Europe. When we left this port 24 of our seamen, which were brought from Europe, had died, and the same number were now very ill, seven of whom died on our passage to the cape; but we were so happy as to procure a number of English seamen at Batavia before our departure, which recruited the strength that had been wasted in the voyage, and without these recruits, in the Captain's opinion, we should not at last have been able to bring the ship home. On Monday the 20th, we anchored on the S. E. side of Prince's Island, in the strait of Sunda, at which time we had the wind fresh from the S. E. We have just given a descriptive, historical, and geographical account, of the islands of Sunda, and Java, and in a former voyage of the *Philippine Isles*, to render which full and complete, we shall here describe some other noted islands and places in the Indian seas, to which, at least, references are made in the instructive and entertaining voyages which compose this work.

(1.) The *Nicobar Islands*, which are situated in the Indian sea, between 7 and 10 degrees of north latitude, and between 92 and 94 degrees east longitude, near the entrance of the bay of Bengal, a little north of the island of Sumatra. These isles form three clusters; the middle, called *Sombrero*, are well inhabited, except one; the northern cluster, called *Carnicubars*, are not so populous. The southern cluster of the *Nicobars*, are very mountainous, and the people much more savage than those of the middle and northern clusters. The priests of

of Sombrero, are dressed much in the same manner as we paint the devil, by which appearance they keep the inhabitants in awe. The largest of these islands, which lies most to the south, is 40 miles long, and 15 broad: the south end is mountainous, and there are some steep rocks near the sea; the rest of the island is covered with woods, but has no high land. It is a rich soil, that would produce almost any grain, if it was cultivated. The groves of cocoa-nut trees that grow in the flat country near the sea, are exceeding pleasant; but we do not find an account of any towns; only, as we sail by sea, we can perceive groups, containing each five or six houses in every creek and bay, which are built on bamboo pillars, eight or nine feet above the surface of the ground, the roof being neatly arched with bended cane, and covered with palm branches.

These islanders are of the middle stature, their complexion a deep olive, their long hair and eyes black. The men wear no cloaths, but a piece of linen cloth about their loins; that of the women reaches below the knees. Their women might be esteemed handsome, if it was not the custom to pull the hair off their eye-brows by the roots. They neglect to clear the country, and cultivate the ground, which is over-run with wood; and they live chiefly on fish, and such fruits as the country produces spontaneously. They have little trade or commerce with any other people; but as ships sail in their way to and from the straits of Malacca, they bring off hogs, poultry, and such fruits as the country affords, taking tobacco, linen, and other necessaries in return.

(2.) The Andoman, and Cocoa Islands. The former are situated in the bay of Bengal, north of the Nicobar Islands, in between 10 and 15 degrees of north latitude, longitude 92 degrees east. These islands do not seem to differ much from those of Nicobar, except in producing rice, which is cultivated and eaten by the natives as well as fish and fruit. The Cocoa Islands lie 35 leagues W. S. W. of Cape Negrais; they produce great abundance of cocoa-trees, but are uninhabited.

(3.) The famous island of Ceylon, which lies between 5 deg. 30 min. and 10 deg. 16 min. N. latitude; and between 79 deg. 40 min. and 82 deg. 45 min. E. longitude; at the distance of about 190 miles from Cape Comorin. Ptolemy described this island under the name of Taprobane. It is 900 miles in circumference, 300 in length, and 140 in breadth. It is for the most part a mountainous country, covered with wood; but there are several fruitful plains and valleys, well watered by rivulets. A very remarkable mountain, which stands on the south-side of Condula, the name of the northern division, is, by the natives, called Hamalel; but by the Europeans, Adam's Peak, being of a pyramidal form, only on the top is a little rocky plain, with a print of a man's foot on it, near two feet long, to which the natives go in pilgrimage once a year, to worship the impression, having a tradition, according to some, that their god Buddow ascended to heaven from hence, leaving this print of his foot, which the Portuguese, when they possessed this island, called Adam's foot, and the mountain Pico de Adam; but others affirm, that it received its name from a tradition of the natives, that Adam was created and buried here. In this mountain rise the principal rivers, which run into the sea in different directions. The largest of these is the Mavillagonga, which runs N. E. of the cities of Candy and Alatur, discharging itself into the ocean at Trincomale. These rivers run with such rapidity, and are so full of rocks, that none of them are navigable: the rains, which happen when the sun is vertical, increase their waters, and create abundance of torrents, which are not visible in the dry season. The air is for the most part healthful, except near the sea, and the north part of the island, where they have no springs, or rivers; and if the rain fails them, they are sure to be afflicted with famine or sickness. The chief towns are, 1. Candy, the capital of the island, and situate near the center of it, in latitude 8 deg. N. and 79 deg. E. longitude. This is an open town with fortifications, and yet almost inaccessible.

No. 37.

ble, being surrounded by rocks and thick woods that are impassable, except through some lanes, which are fenced with gates of strong thorns: and yet it appears that the Portuguese made themselves masters of Candy, and almost demolished it, obliging the king to retire to Digligyneur, five miles S. E. of Candy. 2. Columbo, the capital of the Dutch settlements, is a great port town in the S. W. part of the island, in 7 deg. N. latitude, and in 78 deg. E. longitude. It has a good harbour, defended by a castle, and several batteries of guns. In this castle resides the governor, merchants, officers and soldiers, belonging to the East India Company; and 4000 slaves have their huts between the castle and the sea. The Dutch have two hospitals here: one for the sick and wounded, and another for the orphans. As the boys grow up, they are entered into the sea and land service; and the girls are married at 12 or 13 years of age; and they have a Malabarian school for teaching the Indian language. 3. Negumbo, which is also a port town, lies about 25 miles north of Columbo. 4. Jaffnapatan, the capital of the province of the same name, and the northern division of this island. There is no cinnamon in this part of the island, nevertheless the Dutch have fortified it all round, to prevent any other nation sending colonies thither. 5. Trincomale is situate on the east-side of the island, about 80 miles south of Punta Pedra, the most northerly promontory of the island. 6. Battadialio is another fortress, 50 miles south of the former: besides which places, there are the seven little islands Ourature, Xho, Desferba, Analativa, Caradiva, Pongardiva, and Nainandiva.

With regard to the history of this island, the country villages of the natives are very irregular, being not laid out in streets, but every man incloses a spot of ground, with a bank or pale suitable to his circumstances, and there are frequently 20 or 30 of these inclosures pretty near together. The buildings are mean, the houses of the generality of the people, low thatched cottages, consisting of one or two ground rooms, the sides whereof are splintered with rattans or cane, which they do not always cover with clay, and if they do, it seems they are not permitted to white-wash them, this being a royal privilege. The better sort of people have a square in the middle of their houses, and as many rooms on the sides of it as the number of the family requires, with banks of earth raised a yard high above this square court, whereon they sit cross-legged, and eat or converse with their friends. Their meat is dressed in their yards, or a corner of the room. Their furniture consists of a mat, a stool or two, a few china plates, with some earthen and brazen vessels for water, and to dress their meat in, except one bedstead, which is allotted to the master of the house to sit or sleep on, and this is corded, if we may use the expression, with rattans or small canes; and has a mat or two and a straw pillow upon it, but no tester and curtains. The women and children lie on mats by the fire-side, covering themselves only with the cloth they wear in the day time; but they will have a fire burning at their feet, all night, the poorest among them never wanting fuel, wood being so plentiful that no one thinks it worth while to claim any property in it. Their Pagodas or Temples, which are of any antiquity, are built of hewn stone, with numbers of images both on the inside and out, but no windows in them, and in all other respects like those on the neighbouring continent of India; but their temples of a modern date are little low buildings with clay walls, almost in the form of a dove-house; and besides their public temples, they have small chapels in their yards, sometimes not more than two feet square, which they set upon a pillar four feet high, and having placed in it the image they reverence most, they light candles and lamps before it, and every morning strew flowers while performing their devotions.

The natives are esteemed men of good parts and address, grave, yet of an easy temper. They eat and sleep moderately, but are lazy and indolent, which is

the case in most hot climates. It is said, that they are not given to thieving, but are much addicted to lying, which seems to be a paradox; for a man who will lie and deceive, would not make much scruple to cheat. They are far from being jealous, or restraining of their women from taking innocent freedoms. The men are of a moderate stature, and well proportioned, wear long beards, and have good features; their hair and eyes are black; they have dark complexions, but not black as the natives upon the neighbouring continent of India are. They sit on mats and carpets on the floor, but have a stool or two for persons of distinction; but the vulgar are prohibited the use of stools. Young men of figure wear their hair long and combed back; but, in a more advanced age, caps in the form of a mitre are worn. Their dress is a waistcoat of callico, and a piece of the same wrapped round their waists, in which they put their knives and trinkets, and they have a hanger by their side, in a silver scabbard: besides which they walk with a cane or tuck, and a boy carries a box with betel and areca after them. The betel is a leaf of the shape of a laurel leaf, and the areca-nut about the bigness of a nutmeg, which they cut in thin slices, with an instrument made on purpose for it, and this, with a paste made of lime, they chew together almost all day long, as most other Indians do: this mixture seems to be a kind of opiate, and renders them perfectly easy while they use it. They have a person to carry a covered silver pot, or one made of some other metal, to spit in: for this composition has a nauseous smell, and it would be the greatest affront imaginable to spit on the carpets or floors in a friend's house, and those that chew it spit perpetually. It makes their lips very red, of which they are proud, and this may be one reason for their taking it; but there is nothing inviting in the taste of this luxurious dainty, though universally chewed, and is the first thing offered a stranger when he makes a visit. The women wear their hair long without any covering, and make it shine with cocoanut oil, which has a very rancid smell, though the natives esteem it a perfume, for custom will bring people to like almost any thing. The women are dressed in a callico waistcoat, which discovers their shape, and they wrap a piece of callico about them, which falls below their knees, and does the service of a petticoat: these are longer, or shorter, according to the quality of the person who wears them. They bore holes in their ears, in which they hang such a weight of jewels, or something that resembles them, that you may put a half crown through the hole of their ears: they load their necks also with weighty necklaces, which fall upon their breasts, containing a great many strings or rounds of beads: their arms are adorned with bracelets; and they have a number of rings on their fingers and toes; and a girdle of silver wire surrounds their waists. When they go abroad, they throw a piece of striped silk over their heads, which sometimes resembles a hood. The people are obliged to go bare-footed, because none but the king is allowed to wear shoes and stockings. The usual salutation among these people, is the same as in other parts of India, namely, the carrying one or both hands to their heads, according to the quality of the person they salute. Talkative people are in no repute; for the nearest relations, or most particular friends, do not talk much when they visit, but sit silent a great part of the time. A man before marriage, sends a friend to purchase the woman's cloaths, which she freely sells for a stipulated sum. In the evening he carries them to her, sleeps with her all night, and in the morning appoints the day of marriage; on which he provides an entertainment of two courses for the friends of both parties. The feast is held at the bride's house, when the young couple eat out of the same dish, sleep together that night, and on the ensuing morning depart for the bridegroom's habitation. The meaning of making a purchase of the bride's cloaths is, that she and her friends may be satisfied with respect to the man's circumstances. They are permitted to part with each other whenever they please; but if there should be any

children, the man is obliged to maintain the boys, and the woman the girls; and they are so inclined to avail themselves of this liberty, that some of them have been known to change a dozen times. The profession of a midwife is unknown, as the women, in general, are both willing and qualified on that occasion to assist each other.

This island produces rice, of which they have several kinds: one of them will be seven months before it comes to maturity, some six, and others five, between the seed time and harvest: that which grows fastest is the best tasted, but yields the least increase; and as all sorts of rice grow in water, the inhabitants are at great labour and expence in levelling the ground they design for tillage, and making channels from their wells and repositories of water, to convey to these fields: they cut out the sides of their hills from the top to the bottom, into little level plains, one above another, that the water may stand in them till the corn is ripe; and these levels not being more than six or eight feet wide, many of them look like stairs to ascend the mountain, at a little distance. In the north part of the island, where there are few springs, they save the rain water in great ponds, or tanques, of a mile in compass, in the time of the monsoons, and when their seeds are sown, let it down into them gradually, so that it may hold out till harvest. They do not thrash, but tread out their corn with oxen and buffaloes, frequently in the field where it grows. When it is reaped, they lay out a round spot of ground for this purpose, about 25 feet over, which they dig a foot and a half deep, and the women, whose business it is, bring the corn in bundles on their heads, after which the cattle are driven round the pit till they have trampled it out of the straw: then a new floor is laid; and with half a dozen oxen they will trample out 40 or 50 bushels a day. Before they begin to tread out the corn, they always perform a religious ceremony, and apply to their idols for a blessing on their labours. They have several other kinds of grain, which they eat at the latter end of the year, when rice begins to be scarce, particularly coracan, which is as small as a mustard seed. Having beat this, and ground it into flour, they make cakes of it. This grain grows in dry ground, and is ripe within three or four months after it is sown. They have also a seed, called tola, of which they make oil, and anoint themselves with it.

In this island are a great variety of fruits, but the natives seldom eat them ripe, or cultivate any but those which serve to make pickles for their soup or curree, and for sauces, when they are green, to eat with their rice. Of the betel they have great abundance, which they formerly exported to the coast of Coromandel, to great advantage, before the Dutch excluded them from all trade with foreigners. The fruit called jacka, is part of their food. They grow upon large trees, are round in their shape, and as big as a peck loaf. They are covered with a green prickly rind; have seeds and kernels in them as big as a chestnut; and are in colour and taste like them. They gather these jackas before they are ripe; and, when boiled, they eat much like cabbage; if suffered to grow till ripe, they are very good to eat raw. The natives roast the kernel in the embers, and carry with them when they take a journey, for their provision. There is another kind of fruit called jumbo, which is very juicy, and tastes like an apple: it is white, streaked with red, and looks very beautiful. They have also some fruits that resemble our plums and cherries; nor do they want any of the common Indian fruits, such as mangoes, cocoas, pine-apples, melons, pomegranates, oranges of several sorts, citrons, limes, &c. They frequently dedicate their fruit to some demon, to prevent their being stolen: after which their neighbours dare not touch them, lest the demon, to which they are devoted, should punish them for the theft; and before the owner eats of it himself, he offers part of it to the idol. Their kitchen gardens are well stored with roots, plants, and herbs, for the Portuguese and Dutch have introduced

all manner of European plants that grow in our kitchen gardens. They also abound in medicinal herbs, which they know very well how to apply, and with which they perform many notable cures.

Nor are they in want of flowers of various colours, and a delicious scent, which grow spontaneously; but are never cultivated: with these, the young people of both sexes adorn their hair. With a variety of others, they have white and red roses, as sweet and beautiful as those in Europe, and a white flower resembling jessamine, which the king reserves for his own use, no subject being allowed to wear it. There is another flower, which is observed to open about four every evening, and close again at four in the morning.

Among their trees the talipot, which grows very tall and straight, is in high repute. A single leaf of this will cover 15 or 20 men, and will fold up like a fan: they wear a piece of it on their heads, when travelling, to screen them from the sun. They also serve the soldiers for tents to lie under in the fields; and their leaves are so tough, that they make their way with them through the thickets without tearing them. There is likewise a tree called kettule, a kind of palm, as high as a cocoa-tree, from whence they draw a pleasant liquor; an ordinary tree yielding three or four gallons a day; and when boiled, it makes a kind of brown sugar, called jaggory. The wood of this tree is black, hard, and very heavy. But that of most value to the Dutch, as it was formerly to the Arabs, and the Portuguese, is the cinnamon-tree, which grows commonly in the woods, on the S. W. part of the island. The tree is of a middle size, and has a leaf of the form of a laurel leaf. When the leaves first appear, they are as red as scarlet, and being rubbed between the fingers, smell like cloves. It bears a fruit like an acorn, which neither smells nor tastes like the bark; but if boiled in water, an oil swims on the top, which smells sweetly, and is used as an ointment in several distempers: but as they have great plenty of it, they frequently burn it in their lamps. The tree having two barks, they strip off the outside bark, which is good for little, and then cut the inner bark round the tree with a pruning knife; after which they cut it long ways in little slips, and after they have stripped these pieces off, lay them in the sun to dry, when they roll up in the manner we see them brought over. The body of the tree is white, and serves for building, and other uses, but has neither the smell nor taste of the bark. When the wind sets off the island, the cinnamon groves perfume the air for many miles out at sea, of which we have incontestible evidence; and most likely it is at that time of the year, when the cinnamon trees are in blossom.

Of the animals that abound in this island, are elephants of a very large size; also oxen, buffaloes, deer, hogs, goats, monkeys, and some wild beasts; but they had neither horses, asses, or sheep, till they were imported by the Europeans; nor have they any lions or wolves. The elephants feed upon the tender twigs of trees, corn, and grass, as it is growing, and do the husbandmen a great deal of mischief, by trampling down their corn, as well as eating it, and spoiling their trees. The monkeys have black faces and white beards, much resembling old men. Alligators and crocodiles abound, as do also serpents of a monstrous size; and here is an animal in all respects like a deer, but not bigger than a hare. Vermin and insects are very numerous, particularly ants, which eat every thing they come at, except iron, and such hard substances. Their houses are pestered with them. When full grown they have wings, and fly up in such clouds, that they intercept the light of the sun; soon after which they fall down dead, and are eaten by fowls, who devour them also at other times. The common sort of bees build in hollow trees, or in holes of the rocks; but there are much larger bees, of a more lively colour, which form their combs upon the high boughs of trees, and, at the proper season, the country people go out into the woods and take their honey. In the season when the rains

begin to fall, they are troubled with small red leeches, which are not at first much bigger than a hair; these run up the bare legs of travellers, and fixing themselves there, are not easily removed, till the blood runs about their heels. The remedy used against their bite is, to rub the legs with a composition of albes, lemon-juice, and salt. The bite of these creatures is so far from being attended with any ill consequences, that the bleeding, which is the effect of it, is esteemed very wholesome. Their fowls are geese, ducks, turkeys, hens, woodcocks, partridges, snipes, wild peacocks, parrots, and a beautiful sparrow as white as snow, all but its head, which is black, with a plume of feathers standing upright upon it. The tail of these birds is a foot in length.

In this island the inhabitants make savoury soups of flesh or fish, which they eat with their rice: people of condition will have several dishes at their tables, but they consist chiefly of rice, soups, herbs, garden-roots, and vegetables. Of flesh and fish they eat but little. Their meat is cut into small square pieces, and two or three ounces of it laid on the side of the dish by their rice, and, being seasoned very high, gives a relish to that insipid food. They use no knives or forks, but have ladles and spoons made of the cocoa-nut shell. Their plates are of brass or china-ware; but the poor have a broad leaf instead of a plate, and sometimes several leaves sewed together with bents, where broad ones are not to be had. Water is their usual drink, which they pour out of a cruce or bottle, holding it more than a foot above their heads; and some of them will swallow near a quart of water in this manner without gulping once. Neither wine nor beer is made in this country, but arrack and spirits are drawn from rice. They never eat beef, the bull and cow being objects of adoration. Neither the people in a high or low station eat with their wives: the man sits by himself, and the women and children eat after he has dined. In this woody and mountainous country are no wheel carriages, unless what belong to the Dutch near the seacoast. The baggage is carried usually upon the backs of their slaves. The chief manufactures here are callico and cotton cloths: they make also brass, copper, and earthen vessels, swords, knives, and working tools: they also now make pretty good fire-arms; and goldsmith's work, painting, and carving, are performed tolerably well. We may trace their foreign trade up to the earliest ages. They supplied Persia, Arabia, Egypt, and Ethiopia, with their spices, before Jacob went down into Egypt, which is above 3000 years since, as appears by the history of Joseph's being sold to Ishmaelite merchants, who were travelling with a caravan across Arabia to Egypt with the spices of India, of which the cinnamon of Ceylon, that lies near the coast of hither India, was no doubt the chief; and so profitable was this branch of trade, that all the nations above mentioned sent colonies hither, whose descendants were planted here when the Portuguese first visited this coast.

Here the Portuguese language is spoken; however, the natives have a language of their own, which comes nearest to that spoken on the Malabar coast: the Bramins or priests speak a dead language, in which the books relating to their religion are written. They write upon the leaves of the talipot cut into pieces of three fingers broad, and two foot long, with a steel style or bodkin. They have long studied astronomy, which they learnt from the Arabians, and foretell eclipses tolerably well: they are great pretenders also to astrology, and by the planets calculate nativities, and direct people when will be the most lucky days to enter upon any affair of moment, or to begin a journey; and they find those who are weak enough to be imposed upon, though they may have been many times disappointed. Their year is divided into 365 days, and every day into 30 pays or parts, and their night into as many; and they have a little copper dish, with a hole in the bottom of it, which being put into a tub of water, is filled during one of their pays, when it sinks, and then it

is put into the water again to measure another pay; for they have neither sun-dials nor clocks.

In Ceylon, the criminals are frequently impaled alive; others have stakes driven through their bodies; some are hung upon trees; and many are worried by dogs, who are so accustomed to the horrid butchery, that, on the days appointed for the death of criminals, they, by certain tokens, run to the place of execution. But the most remarkable punishment is inflicted by the king himself, who rides an elephant trained up on purpose. The beast tramples the unhappy wretch to death, and tears him limb from limb. Some are punished by fines and imprisonment, at the discretion of the judges. When the fine is decreed, the officers seize the culprit, wherever they meet him, strip him naked, his cloaths going as part of payment, and oblige him to carry a large stone, the weight being increased daily, by the addition of others that are smaller, till the remainder of the mulct is either paid or remitted. Any of the male cinglosses may indifferently charge another within hearing (as we do the constables) to aid and assist them in the execution of their duty, or upon any emergency; but the women are not permitted to mention the king's name, upon the severe penalty of having their tongues cut out for the offence. A creditor sometimes will go to the house of the debtor, and very gravely affirm, that if he does not discharge the debt he owes him immediately, he will destroy himself: this so terrifies the other, that he instantly collects all the money he can, even selling his wife and children rather than be deficient in his payment of the sum demanded. This is owing to a law, which specifies, that, if any man destroys himself on account of a debt not being discharged, the debtor shall immediately pay the money to the surviving relations, and forfeit his own life, unless he is able to redeem it by a large fine to the king. They have two modes of deciding controversies; the one is by imprecating curses to fall upon them if they do not speak the truth; and by the other, both persons are obliged to put their fingers into boiling oil, when the person who can bear the pain the longest, and with the least appearance of being affected, is deemed innocent. They have, however, methods of evading both these laws; the first, by using ambiguous expressions; and the latter, by certain preparations, which prevent the oil from doing them any injury. It is not lawful to beat a woman without permission from the king; so that the females may thank his majesty for all the blows they get. But they may be made to carry heavy baskets of sand upon their heads as long as the man pleases, which is much more dreadful to them than a hearty drubbing. The circumstances of the children depend upon those of the mother; for if the mother is a free woman, they are free, but if she is a slave, they are always vassals.

They have neither physicians nor surgeons among them; yet, as to physic, every one almost understands the common remedies, applying herbs or roots, according to the nature of the complaint; and they have an herb which cures the bite of a snake. As they abound in poisonous herbs and plants, so they have others that are antidotes against them. Their diseases are chiefly fevers, fluxes, and the small-pox. They are never let blood, except by the leaches, already mentioned, from which they acknowledge they have sometimes received great benefit.

With regard to the religion of these people, they worship God, but make no image of him; however, they have idols, the representatives of some great men, who formerly lived upon the earth, and are now, they imagine, mediators for them to the supreme God of heaven. The chief of those demi-gods is Baddow, who according to their tradition originally came from heaven to procure the happiness of men, and ascended thither again from Adam's Mountain, leaving the impression of his foot upon the rock. They are said, likewise, to worship the devil, that he should do them no mischief; and another of their objects of worship is the tooth of a monkey. They worship also the sun,

moon, and other planets. Every town has its tutelar daemon, and every family their penates, or household gods, to whom they build chapels in their courts, paying their devotions, and sacrificing to them every morning; but to the supreme deity they erect no temples or altars. There are three classes of idols, and as many orders of priests, who have their several temples, to which estates in land are appropriated. Buddow is the chief of these subordinate deities, and his priests in the greatest esteem, being all of the highest cast or tribe in the nation. They wear a yellow vest and mantle, have their heads shaved, and their beards grow to a great length. Their disciples fall down on their faces before them; and they have a stool to sit on wherever they visit, which is an honour only shewn to their princes and great men. These priests have no commerce with women, drink no strong liquor, and eat only one meal a day; but they are not debarred from flesh, except beef. They are styled sons of the god Buddow, and cannot be called to account by the civil power, whatever crimes they commit. There is a second order of priests, that officiate in the temples of other idols; these are allowed to follow any secular employment, and are not distinguished from the laity by their habits, but have, however, a certain revenue. Every morning and evening they attend the service of their temples; and when the people sacrifice rice and fruits, the priest presents them before the idol, and then delivers them to the singing men and women, and other servants that belong to the temple, and to the poor devotees, who eat the provisions: no flesh is ever sacrificed to the idols of this class. The third order of priests have no revenues, but build temples for themselves, without any election or consecration, and beg money to maintain themselves. These mendicants are mountebanks in their way, shewing a variety of whimsical tricks for their bread. They are prohibited by law, from touching the waters in wells or springs, nor must they use any but what is procured from rivers and ditches. They are considered in so despicable a light, that it is held disgraceful to have any connections with them. Wednesdays and Saturdays are the days they resort to their temples; and at the new and full moon they offer sacrifices to the god Buddow; and on new year's-day, in the month of March, they offer a solemn sacrifice to him, on a high mountain, or under a spreading tree that is deemed sacred. The principal festival of the Chingulays is observed in the month of July, in honour of the moon, when a priest goes in solemn procession with a garland of flowers, to which the people present their offerings. The ridiculous pageantry attending this festival, was attempted to be abolished in 1664; but the attempt occasioned an insurrection, so that the kings of Ceylon are obliged to let them continue the pompous mummery. They have also idols of monstrous shapes and forms, made of silver, brass, and other metals, and sometimes of clay; but those in Buddow's temples are the figures of men sitting cross-legged, in yellow habits, like his priests, representing some holy men, who, they say, were teachers of virtue, and benefactors to mankind.

The island of Ceylon was formerly divided into nine monarchies, but, at present it is under the dominion of one king, whose court is kept in the center of the island, at a place called Digligy-Neur: the palace is but newly built, the gates large, stately, and finely carved: the window-frames are made of ebony, and inlaid with silver: the kings elephants, troops, and concubines, are numerous. The guards are commanded by Dutch and Portuguese renegade officers. This monarch assumes great dignity, and demands much respect, which his subjects readily pay him, as they imagine, that all their kings immediately on their demise, are turned into gods. He expects that Christians should salute him kneeling, and uncovered, but requires nothing more of them. His title is, Emperor of Ceylon, king of Candy, prince of Onva, and the four Corles, great duke of the seven Corles, marquis of Duranura, lord of the sea-port, and

and fisheries of pearls, and precious stones, lord of the golden sun, &c. His revenue consists in the gifts and offerings of his subjects; his palaces are built upon almost inaccessible places, for the greater security: no bridges are permitted to be erected over rivers or streams, nor any good roads to be made, to render the country as impassable as possible. None are suffered to approach his palace without a passport stamped in clay. The troops are hereditary, and their weapons are swords, guns, pikes, bows and arrows. They are subtle, but not courageous, and will not engage an enemy but by surprise, or when there is some manifest advantage in their favour. It is so difficult to penetrate into the inland parts, and all the passes are so well guarded, that even the Dutch themselves are unacquainted with the greatest part of the island. In the year 1505 the Portuguese landed in Ceylon, and about twelve years after they established factories there, the reigning king permitting them to build forts; and, upon his demise, he declared the king of Portugal his heir; but in process of time the Portuguese behaving with great insolence and cruelty, the young king of Candy invited the Dutch, in 1639, who after a tedious war, at length, in the year 1655, subdued the Portuguese, and became masters of the trade and coast: upon which they drove the king, their ally, into the mountains, and, with their wonted gratitude, made him their tributary. The Dutch have in subsequent years committed many cruelties, and the natives frequently retaliate by making excursions among them, or murdering all they meet with at a distance from the forts, and in the interior part of the island.

(4.) The Maldives. The Maldivia islands, so called from Male, the chief of them, which is the residence of their king, lie about four hundred miles south west of Ceylon and Cape Comorin. They extend from 4 deg. S. to 8 deg. N. latitude; and are about 600 miles in length, and upwards of 100 in the broadest part. They are said to be 1000 in number, but many of them are only large hillocks of sand, and from the barrenness of the soil, are uninhabited. The whole country is divided into 13 provinces, called Attolons, each of which contains many small islands, and is of a circular form, about 100 miles in circumference. These provinces all lie in a line, and are separated from each other by channels, four of which are navigable for large ships; but are very dangerous, on account of the amazing rocks that break the force of the sea, and raise prodigious surges. At the bottom of these channels is found a substance like white coral, which, when boiled in cocoa-water, greatly resembles sugar. The currents generally run east and west alternately six months, but the time of the change is uncertain; and sometimes they change from N. to S. The climate is exceeding sultry, this country lying near the equinoxial line on both sides: the nights, however, are tolerably cool, and produce heavy dews that are refreshing to the trees and vegetables. Their winter commences in April, and continues till October, during which they have perpetual rains, with strong easterly winds, but never any frost. The summer begins in October, and continues six months, during which time the winds are easterly, and the heat is so excessive as scarce to be borne, there not being any rain throughout that season.

In general these islands are very fertile, and produce great quantities of millet, and another grain much like it, of both which they have two harvests every year. Here are also several kind of roots that serve for food, particularly a sort of bread-fruit, called nell-pou, which grows wild and in great plenty. The woods produce excellent fruits, as cocoas, citrons, pomegranates, and India figs. Their only animals for use are sheep and buffaloes, except a few cows and bulls that belong to the king, and are imported from the continent; but these are only used at particular festivals. The natives have not much poultry, but they are supplied with prodigious quantities of wild fowl that are caught in the woods, and sold at a very low price. They have

No. 37.

also plenty of wild pigeons, ducks, rails, and birds resembling sparrow-hawks. The sea produces most kinds of fish, great quantities of which are exported from hence to Sumatra. Among the fish is one called a cowrie, the shells of which (called in England black-moor's teeth) are used in most part of the Indies instead of coin.

The only poisonous animals here are snakes; a dangerous sort of them infest the borders of the sea. The inhabitants also are much troubled with rats, dormice, pismires, and other species of vermin, which are very destructive to their provisions, fruit, and other perishable commodities; for which reason they build their granaries on piles in the sea, at some distance from the shore; and in this manner most of the king's granaries are built.

In these islands the natives are very robust, of an olive complexion, and well featured. They are naturally ingenious, and apply themselves with great industry to various manufactures, particularly the making of silk and cotton. They are cautious, and sharp in trading, courageous, and well skilled in arms. The common people go almost naked, having only a piece of cotton fastened round the waist, except on festival days, when they wear cotton or silk jerkins, with waistcoats, the sleeves of which reach only to their elbows. The wealthier sort tie a piece of cloth between their legs, and round the waist, next to which they have a piece of blue, or red cotton, that reaches to the knees, and to that is joined a large piece of cotton and silk, reaching to their ancles, and girded with a square handkerchief embroidered with gold or silver; and the whole is secured by a large silk girdle fringed, the ends of which hang down before; and within this girdle, on the left side, they keep their money and betel, and on the right side a knife. They set great value on this instrument, from its being their only weapon; for none but the king's officers and soldiers are permitted to wear any other. The rich have silk turbans on their heads, richly adorned, but those of the poor are made of cotton, and only ornamented with ribbons of various colours. The women are fairer than the men, and, in general, of a very agreeable disposition. They wear a coat of cotton, or silk, that reaches down to the ancles, over which they have a long robe of taffety, or fine cotton, that extends from the shoulders to the feet, and is fastened round the neck by two gilt buttons. Their hair, which is esteemed a great ornament, is black; and to obtain this, they keep their daughters heads shaved till they are eight or ten years of age, leaving only a little hair on their foreheads to distinguish them from the boys. They wash their heads and hair in water, to make the latter thick and long, and let it hang loose that the air may dry it; after which they perfume it with an odoriferous oil. When this is done, they stroke all the hair backwards from the forehead, and tie it behind in a knot, to which they add a large lock of a man's hair; and the whole is curiously ornamented with flowers of various sorts. The common people have houses built of cocoa-wood, and covered with leaves sewed one within another; but the superior sort build their houses of stone, which is taken from under the flats and rocks in the following manner: among other trees in this island, is one called Candou, exceedingly soft, and, when dry, and sawed into planks, is much lighter than cork: the natives, who are excellent swimmers, dive under water, and, having fixed upon a stone for that purpose, they fasten a strong rope to it: after this, they take a plank of the Candou-wood, which, having a hole bored in it, is put on the rope, and forced down quite to the stone: they then run on a number of other boards, till the light wood rises up to the top, dragging the stone along with it. By this contrivance the natives weighed up the cannon and anchors of a French ship that was cast away near their coast about a century ago.

The Maldivians, in general, are very polite, particularly those on the island of Male; but they are very libidinous, and fornication is not considered as any crime;

crime; neither must any person offer insult to a woman that has been guilty of misconduct previous to marriage. Every man is allowed to have three wives if he can maintain them, but not more. The girls are marriageable at eight years of age, when they wear an additional covering on their necks; the boys go naked till seven, when they are circumcised, and wear the usual dress of their country afterwards. These people are very abstemious in their diet, their principal food consisting of roots made into meal, and baked; particularly those called *nell-pou*, and *elas*, the latter of which they dress several ways: they also make a pottage of milk, cocoa, honey, and bread, which they esteem an excellent dish; and their common drink is water. They sit cross legged at their meals, in the same manner as in other eastern countries. The floor on which they sit is covered with a fine mat, and they use banana leaves instead of table cloths. Their dishes are chiefly of china, all vessels of gold, or silver, being prohibited by law: they are made round with a cover, over which is a piece of silk to keep out the ants. They take up their victuals between their fingers, and in so careful a manner as not to let any fall; and if they have occasion to spit, they rise from the table and walk out. They do not drink till they have finished their meal, for they consider that as a mark of rudeness; and they are very cautious of eating in the presence of strangers. They have no set meals, attending only to the call of nature, and all their provisions are dressed by the women, for to cook is accounted disgraceful to a man. Being naturally very cleanly, as soon as they rise in the morning they wash themselves, rub their eyes with oil, and black their eye-brows. They are also very careful in washing and cleansing their teeth, that they may the better receive the stain of the betel and areca, which is red, a colour they are particularly fond of. They present betel, which they keep always about them, upon occasional salutations, as we do snuff.

They have many pagan customs, though they profess the religion of the Mahometans. When they meet with any disaster at sea, they pray to the king of the winds; and there is in every island a place, where those who have escaped danger make offerings to him of little vessels made for the purpose, in which they put fragrant woods, flowers, and other perfumes, and then turn the vessel adrift to the mercy of the waves. They dare not spit to the windward, for fear of offending this aerial deity; and all the vessels that are devoted to him, are kept as clean as their mosques. They impute crosses, sickness, and death to the devil; and in order to pacify him, in a certain place, make him banquets and offerings of flowers. Each of their mosques is situated in the center of a square, and round it they bury their dead: they are very neat buildings, have three doors, each ascended by a flight of steps: the walls within are wainscoted, and the ceiling is of wood beautifully variegated. The floor is of polished stone, covered with mats and tapestry; and the ceiling and wainscoting are firmly joined, without either nails or pegs. Each mosque has its priest, who, besides the duties of his office, teaches the children to read and write the Maldivian language, which is a radical tongue: he also instructs them in the Arabic tongue, and is rewarded for these services by the parents. Those of the people, who are very religious, go to their mosques five times a day; and before they enter it, they wash their feet, hands, ears, eyes and mouth. They who do not go to the mosque, may say their prayers at home; but if they are known to omit doing one or the other, they are treated with the greatest contempt, and every body avoids their company. They keep their Sabbath on Friday, which is celebrated with great festivity; and the same is observed on the day of every new moon. They have several other festivals in the course of the year; the most distinguished of which is called *maulude*, and is held in the month of October, on the night of which Mahomet died. On this occasion a large wooden house, or hall, is erected on a particular part

of the island, the inside of which is lined with the richest tapestry. In the middle of the hall is a table covered with various sorts of provisions, and round it are hung a prodigious number of lamps, the smoke of which gives a most fragrant scent. The people assemble about 8 o'clock in the evening, and are placed by proper officers appointed for that purpose, according to their respective stations. The priests, and other ecclesiastics sing till midnight, when the whole assembly fall prostrate on the ground, in which posture they continue till the chief priest rises, when the rest follow his example. The people are then served with betel and drink; and when the service is entirely over, each takes a part of the provisions on the table, and preserve the same, as a sacred relic, with the utmost care. When two persons enter into the state of marriage, the man gives notice of his design to the *pandiar*, or *maybe*, who demands of him, if he is willing to have the woman proposed for his wife: on his answering in the affirmative, the *pandiar* questions the parents as to their consent; if they approve of it, the woman is brought, and the parties are married in the presence of their relations and friends. After the ceremony is over, the woman is conducted to her husband's house, where she is visited by her friends, and a grand entertainment is provided on the occasion. The bridegroom makes presents to the king, and the bride likewise pays the same kind of compliment to the queen. The man does not receive any dowry with his bride, and he is not only obliged to pay the expence of the nuptial ceremony, and to maintain her, but he must also settle a jointure upon her, though, if she thinks proper, she may relinquish it after marriage. A woman cannot part from her husband without his consent; but a man may at any time divorce his wife; however, if her assent to the separation is not obtained, she may demand her jointure; yet as this is considered as a mean act, it is seldom practiced.

When any one dies, the corpse is washed by one of the same sex, of which there are several in each island appointed for that purpose. After this it is wrapped up in cotton, with the right hand placed on the right ear, and the left on the thigh. Then it is laid on the right side in a coffin of candou wood, and carried to the place of interment by six relations or friends, and followed by the neighbours, who attend without being invited. The grave is covered with a large piece of silk, or cotton, which, after the interment, becomes the property of the priest. The corpse is laid in the grave with the face towards Mahomet's tomb; and when deposited, the grave is filled up with white sand, sprinkled with water. In the procession both to and from the grave, the relations scatter cowries, for the benefit of the poor, and gives pieces of gold and silver to the priest, according to the circumstances of the deceased. The priest sings continually during the ceremony; and when the whole is over, the relations invite the company to a feast. They inclose their graves with wooden rails, for they consider it as a sin for any person to walk over them; and they pay such respect to the bones of the dead, that no persons, not even the priests, dare to touch them. On this occasion they make little difference in their habits: the mourners only go bare-headed to the grave, and continue so for a few days after the ceremony of the funeral. If a person dies at sea, the body, after being washed, is put into a coffin, with a written paper, mentioning his religion, and requesting those who may meet with the corpse to give it a decent interment. They then sing over it, and after having completed their ceremonies, commit it to the waves on a plank of candou wood.

Male, the island where the king resides, is situated in the center of the rest, and is about five miles in circumference. The palace is built of stone, and divided into several courts and apartments; but it is only one story high, and the architecture very insignificant: however, it is elegantly finished within, and surrounded with gardens, in which are fountains and cisterns of water. The portal is built like a square tower; and on festival days

days the musicians sing and play upon the top of it. The ground floors of the respective apartments are raised three feet, to avoid the ants, and are covered with silk-tapestry, fringed, and flowered with gold. The king's beds are hung, like hammocks, between two pillars ornamented with gold, and when he lies down his attendants rock him to sleep. His dress is usually a coat made of fine white cloth or cotton, with white and blue edgings, fastened with buttons of solid gold: under this is a piece of red embroidered tapestry that reaches down to his heels, and is fastened with a large silk girdle fringed, with a great gold chain before, and a locket formed of the most precious stones. On his head he wears a scarlet cap, which is a colour so esteemed, that no other person may presume to wear it. This cap is laced with gold, and on the top of it is a large gold button with a precious stone. The grandees and soldiers wear long hair, but the king's head is shaved once a week; he goes bare legged, but wears sandals of gilt copper, which are worn only by the royal family. When he goes abroad, his dignity is distinguished particularly by a white umbrella, which no other persons, except strangers, are permitted to use. He has three pages near his person, one of whom carries his fur, another his sword and buckler, and a third his box of betel and areca, which he almost constantly chews. He goes to the mosque on Fridays in great pomp, his guards dancing, and striking their swords on each others targets to the sound of music; and is attended on his return, by the principal people of the island. He either walks, or is carried in a chair by slaves, there being no beasts of burden. When the queen appears in public, she is attended by a great number of female slaves, some of whom go before, to give notice to the men to keep out of the way; and four ladies carry a veil of white silk over her head, that reaches to the ground: on this occasion, all the women from the several districts meet her with flowers, fruits, &c. She and her ladies frequently bathe in the sea for their health, for the convenience of which they have a place on the shore close to the water, which is inclosed, and the top of it covered with white cotton. The only light in the chambers of the queen, or those of the ladies of quality, is what lamps afford, which are kept continually burning, it being the custom of the country never to admit day-light. The drawing room, or that part where they usually reside, is blocked up with four or five rows of tapestry, the innermost of which none must lift up till they have coughed, and told their names. The guards appointed to attend on the king's person consist of six hundred, who are commanded by his grandees; and he has considerable magazines of arms, cannon, and several sorts of ammunition. His revenues consist chiefly of a number of islands, appropriated to the crown, with certain taxes on the various productions of others; in the money paid to purchase titles and offices, and for licences to wear fine cloaths. Besides these, he has a claim to all goods imported by shipping; for when a vessel arrives, the king is acquainted with its contents, out of which he takes what he thinks proper, at a low price, and obliges his subjects to purchase them of him again, at what sum he pleases to fix, by way of exchange, for such commodities as best suit him. All the ambergris found in this country (which produces more than any other part of the Indies) is also the property of the king; and so narrowly is it watched, that a person would be punished with the loss of his right hand, if detected in converting it to his own use. Most of the nobility and gentry live in the north part of this island, for the convenience of being near the court; and so much is this quarter esteemed, that when the king banishes a criminal, the sending him to the south is thought to be a sufficient punishment.

The government here is absolute monarchy, every thing depending on the king's pleasure. Each atollon, or province, has a naybe, or governor, who is both a priest and doctor of the law. He not only presides over the inferior priests, and is vested with the management

of all religious affairs, but he is likewise intrusted with the administration of justice, both in civil and criminal cases. They are in fact so many judges, and make four circuits every year throughout their jurisdiction; but they have a superior, called the pandiare, who resides in the isle of Male, and who is not only the supreme judge of all causes, but also the head of the church: he receives appeals from the governor of each province, but does not pass sentence without consulting several learned doctors; and from him appeals are carried to the king, who refers the matter to six of his privy council. The pandiare makes a circuit once a year through the island of Male (as does every governor in his respective province) and condemns all to be scourged who cannot say their creed and prayers in the Arabic tongue, and construe them in that of the Maldivian. At this time the women must not appear in the street unveiled, on pain of having their hair cut off, and their heads shaved, which is very disgraceful. They have various modes of punishment for crimes. If a man is murdered, the wife cannot prosecute the criminal; but if the deceased has left any children, the judge obliges him to maintain them till they are of age, when they may either prosecute or pardon the murderer. Stealing any thing valuable is punished with the amputation of a hand, and, for trifling matters, they are banished to the southern islands. An adulteress is punished by having her hair cut off, and those guilty of perjury pay a pecuniary mulct. Notwithstanding the law makes homicide death, yet a criminal is never condemned to die, unless it is expressly ordered by the king; in which case he orders his own soldiers to execute the sentence.

The chief articles exported from these islands are cocoa-nuts, cowries, and tortoise-shells, the latter of which is exceeding beautiful, and not to be met with in any other place, except the Philippine Islands. The imported articles are, iron, steel, spices, china, rice, &c. all which, as has been observed, are ingrossed by the king, who sells them to his subjects at his own price. They have only one sort of money, which is silver, called lorrins, each of which is about the value of eight pence. It is two inches long, and folded, the king's name being set upon the folds in Arabic characters. One thousand two hundred cowries make one lorrin. In their own market they frequently barter one thing for another. Their gold and silver is all imported from abroad, and is current here as in all other parts of the Indies, by weight.

The Maldives are happily placed, with respect to each other, for producing mutual commerce, to the respective inhabitants; for though the 13 Atollons are in the same climate, and all of them very fertile, yet they produce such different commodities, that the people in one cannot live without what is found in another. The inhabitants have likewise so divided themselves, as greatly to enhance this commercial advantage; for all the weavers live in one island, the goldsmiths in another, and the like of the different manufactures. In order, however, to render the communication easy, these artificers have small boats, built high on the sides, in which they work, sleep, and eat, while sailing from one island to another to expose their goods to sale, and sometimes they are out a considerable time before they return to their fixed habitations.

(5.) Bombay. This is seated on an island near the west coast of India, in 19 deg. N. latitude, and in 72 deg. E. longitude. It is an excellent harbour, from whence the Portuguese, the first possessors of the Europeans, gave it the name of Boonbay, now corruptly called Bombay. The island on which it stands, is about 20 miles in circumference: the chief town is a mile in length, meanly built: the fort stands at a distance from it. The island is inhabited by English, Portuguese, and Moors: there are three or four more small towns on the island. The soil is barren, and the water bad; they preserve therefore the rain water in cisterns; and there is a well of pretty good fresh water about a mile from the town. The king of Portugal transferred this island to Charles II. king of England,

as part of the portion of the Infanta Katherine, whom he married in the year 1662, and the king afterwards gave it to the East India Company. The fort has been besieged both by the Mogul and the Dutch, but neither of them were able to take it. Notwithstanding Bombay lies within the tropics, yet the climate is not disagreeable to the constitution of Europeans; there being but few days in the course of the year, in which the weather is in any extreme. The short hot season precedes the periodical return of the rains: the night dews, however, are very dangerous, therefore great care should be taken not to be exposed to them. If people would but live temperately in this place, they need not be afraid of the climate, which is far healthier than in any other of the Europeans settlements; and there are some good physicians on the island. They have wet weather at Bombay about four months in the year, which is commonly introduced by a very violent thunder storm: during this season all trading vessels are laid up. The rains begin about the latter end of May, and continue till September, when the black merchants keep a festival, gilding a cocoa-nut, which they consecrate and commit to the waves. What they abound in most is their groves of cocoa-nut trees, their rice fields, and onion grounds. Their gardens also produce mangoes, jacks, and other Indian fruits; and they also make large quantities of salt, with very little trouble, from the seawater.

The town or city of Bombay is a mile long, and surrounded by a wall or ditch; it has also a pretty good castle; so that it is well secured, and esteemed one of the strongest places belonging to our East India Company. The houses of the English consist, in general, of a ground floor, with a court both before and behind, in which are out-houses and offices. Most of the windows are of transparent oyster-shells, which admit a tolerable good light. The flooring of their habitations is a sort of stucco, composed of shells that have been burnt; this they call *chunam*, which being well tempered, and becoming hard, receives an excellent polish. The English church is a very neat building, situate on a pleasant green, round which are the houses of the English; as to those in which the black merchants reside, they are, in general, ill contrived structures; and the pagodas of the *gentoos*, are most wretched edifices.

The government is entirely English, subordinate to the India Company, who appoint by commission a president and council; and the maritime and military force is under the immediate direction of the president, who is styled commander in chief. The common soldiers are of many nations; but what are called *topasses*, are for the most part black, or of a mixed breed from the Portuguese. There are also regular companies of the natives, who are called *seapoys*. Any popish priest, except a Portuguese, may officiate in the churches of the three Roman catholic parishes, into which Bombay is divided; but the English formed an objection against the Portuguese, from an apprehension that those fathers might have rather too close a connection with others of their own country, in the adjacent settlements belonging to their master: however, there are no disputes in this town about professions in religion, all alike being tolerated. Liberty of conscience, freedom of speech, riches, and honours, distinguish the people and climate.

Bombay is inhabited by a mixture of all nations; English, Portuguese, and Indians, amounting, as it is said, to 50 or 60,000. The president of Surat is usually governor of the place, who has a deputy here, and courts of justice, regulated as in England. The governor, when he is upon the island, appears in greater state than the governor of fort St. George, being attended, when he goes abroad, by two troops of Moors and *Bandarins*, with their standards. The natives, and those who are seasoned to the country, enjoy a tolerable good state of health, and, if they use temperance, live to a good old age. Near Bombay are several islands, the chief of which are Butcher's Island, Elephanta, and Salfette. The first took its name from great numbers of cattle being kept in it for the use of Bombay; and the

second from the enormous figure of an elephant cut in stone, and which, at a distance, has the appearance of one alive, the stone being exactly of the colour of that quadruped. On this island, which is nearly one entire hill, and about three miles in circumference, there is a temple hewn from the rock. This real curiosity is supported by two rows of pillars, and is 10 feet high. It is an oblong square, about 80 feet in length, and above 40 in breadth, and its roof is formed of the rock cut flat. At the farther end of this singular structure stand the figures of two giants, the faces of which, however, have been much mutilated. The Portuguese, when they became possessed of this island, disfigured and injured these pieces of antiquity as much as possible. This curious fabric has two doors, which front each other; near one of them are several images, much disfigured, and there is one image standing erect, with a drawn dagger in one hand, and a child in the other. The other door, which opens on the left-hand, has an area before it; at the upper end of which is a range of pillars, or colonade, adjoining to an apartment ornamented with regular architecture, round the cornices of which are some paintings. The whole of this temple differs from all of the most antique *gentoo*-buildings; but with respect to the era when genius and labour produced it, no discoveries have yet been made.

Salfette lies northward of Bombay, being about 26 miles long, and 9 broad. Here is a ruined place called Canara, where are several caverns in rocks, which considerably gratify the curiosity of such Europeans who visit them. The soil is extremely fertile, and great plenty of game is found in this island, which it must be acknowledged, is a most agreeable situation. It was originally comprehended under the regality of Bombay, and of consequence became the property of the English crown when Bombay was given to King Charles the second; but the Portuguese defrauded us of it; they, however, lost this island by the invasion of the Marattas, who inhabit the continent bordering on Bombay: they are a very formidable tribe of *gentoos*, who have extended their dominions by dint of arms. Their chief, or king, resides generally in the mountains of Decan, at a fort called Raree; reported to be the strongest place in the universe: it is so well and powerfully guarded by nature, that no enemy can approach it, being surrounded by steep, inaccessible rocks. In this fort the king, or *mar-rajah*, holds his court, and lives in great splendor. He has long been the avowed foe of the Moguls, Subahs, and Nabobs; making war, and concluding treaties, just as he thought his interest might be best promoted. The Marattas are all bred to arms and agriculture: the use of the former they learnt from the Europeans, though they depend greatly on their targets, which will turn the ball of a pistol, and even a musket from a distance. Their swords are excellent, with which they do great execution, but their muskets are very indifferent. Their horses are small, active, and will go through much fatigue. European arts and manufactures receive little encouragement among these people, who prefer those of their own country to the most curious that can be shewn them from foreign parts.

(6.) In 15 deg. 20 min. N. latitude, and 74 deg. 20 min. E. longitude from London, on an island, about 20 miles in length, and six in breadth, stands the large and strong town of Goa, which is the principal place belonging to the Portuguese in India: it was taken by them A. D. 1508. It has the convenience of a fine salt-water river, capable of receiving ships of the greatest burden, where they lie within a mile of the town. The banks of the river are beautified with a great number of handsome structures, such as castles, churches, and gentlemen's houses. The air without the town is very unwholesome, for which reason it is not so well inhabited as formerly. The viceroy's palace is a noble building, and stands at a small distance from the city, which leads to a spacious street, terminated by a beautiful church. Goa contains a great number of handsome churches, convents, and cloisters, with a stately large hospital.

hospital, all well endowed, and kept in good repair. The market-place takes up an acre of ground; and in the shops about it may be had the produce of Europe, Bengal, China, and other countries of less note. Every church has a set of bells, some of which are continually ringing. Their religion is Roman Catholic, and they have a most horrid cruel inquisition. There are a great number of Indian converts, who generally retain some of their old customs, particularly, they cannot be brought to eat beef. However, there are many gentoos in the city, who are tolerated, because they are more industrious than the Christians, and better artists. The clergy are very numerous, and illiterate; but the churches are finely embellished, and have numbers of images. Their houses, which are of stone, are spacious and handsome, and make a fine shew; but they are poorly finished within. The inhabitants are contented with greens, roots, and fruit, which, with a little bread, rice, and fish, is their only diet, though they have hogs and fowls in plenty. They are much addicted to women, and are generally weak, lean, and feeble. Captain Hamilton, when he was in this island, stood on a hill near the city, and counted above 80 churches, convents, and monasteries, and he was told, that there were about 30,000 priests and monks. The body of St. Francis Xavier is buried in St. Paul's Church, and, as they pretend, performs a great many miracles. None of the churches, except one, have glass windows, for they make use of oyster-shells instead of glass. The town itself has few manufactures, or productions, their best trade being in arrack, which they distil from toddy, the sap of the cocoa-nut tree. The river's mouth is defended by several forts and batteries, well planted on both sides with large cannon; and there are several other forts in different places. This settlement is 250 miles N. by W. of Cochin.

(7.) The island of Diu or Dio. This is situated in 21 deg. 45 min. N. latitude, and in 68 deg. 55 min. E. longitude; and is three miles long, and two broad. The town, which bears the same name, is pretty large, and fortified by a high stone wall, with bastions at convenient distances, and well furnished with cannon. The harbour is well secured by two castles, one of which is made use of for powder, and other warlike stores. It was one of the best places in those parts, the structures being built of free stone and marble. It contains five or six fine churches well embellished within, with images and painting, built by the Portuguese; but it is much decayed of late years, not one fourth part of it being inhabited. In 1670 it was taken by the Arabs, who plundered all the churches, and other places, of their riches, but were driven away with the loss of 1000 men. There are not now above 200 Portuguese inhabitants, for the rest are Banians, who may amount to 40,000.

(8.) The Johor Islands. These lie to the N. E. of Cape Romano, but produce nothing fit for the carrying on of commerce. Pulo Aure, one of them, is peopled by Malays, who are said to form a kind of republic, headed by a chief. In this island are several mountains, on which are many plantations of cocoa-trees. Articles of trade are purchased here with iron, and the people have the character of being very honest, friendly, and hospitable.

(9.) Sincapour, or Sincapora, is an island and town, which lie at the southernmost point of the peninsula of Malacca, and gave name to the S. E. part of Malacca Straits. Here is a mountain which yields excellent diamonds; and sugar canes grow to a great size. The soil of Sincapour is fruitful, and the woods produce good timber for ship-building.

(10.) Pulo-Condore, the only one inhabited of several islands in the East India sea, lying off the coast of Cambodia. It is situated in 107 deg. 40 min. E. longitude, and 8 deg. 36 min. N. latitude. It is about 13 miles in length, and nine in breadth, but in some places not above a mile over. The inhabitants of this island are of a middle stature, and well shaped, but their complexion is exceedingly swarthy. Their hair is strait and black, their eyes are remarkably small, and their noses high: they have thin lips, small mouths, white teeth,

No. 38.

and in their dispositions are very courteous. They go almost naked, except on particular occasions, when they are dressed in a long garment girded about the waist, and ornamented with various coloured ribbands. Their houses are built of bamboos, covered with long grass; but they are very small. They are raised several feet from the earth, on account of the dampness of the ground; and they have neither doors nor windows; so that one side is left open as well for convenience of light, as for the entrance of the people. They are very free of their women, and will bring them on board the ships, where they are kept by the sailors while they stay. These people are idolaters, but of what kind is not known; however, they have images of elephants in their temples which are mean edifices built of wood: on the south-side of the island is one of this kind; within it is the figure of an elephant, and without is that of a horse. The soil of this island is a blackish mould, but the hills are somewhat stony. The trees are not very thick, but large, tall, and fit for any use. The principal fruits are mangoes, a sort of grapes, and bastard nutmegs. The animals are hogs, lizards, and bastard nutmegs. There are fowls of various kinds, as turtle doves, pigeons, wild cocks and hens, parrots, and parroquets, and several sorts of birds, not known in Europe. The sea produces great plenty of turtles, limpets, and muscles. The chief employment of the inhabitants is to get tar out of the very large trees that grow here. In 1702, the English settled in this island, after the factory of Chusan, on the coast of China, was broke up. However, they continued here but a short time; for having made an agreement with some Macassars, natives of the island of Celebes, to serve for soldiers, and assist in building a fort, and not discharging them at the end of three years, (for which term they were engaged) they rose in the night, and murdered every Englishman they could find on the island. The English had purchased this island of the king of Cambodia, to whom, after this event, it again reverted. Few remains of the fort are now standing, it having been for the most part demolished. There are several other small islands in these seas, namely,

(1.) Pulo-Pinding, near the continent of Malacca, which belongs to the Dutch where they have a fort.

(2.) Pulo-Timon, on the eastern coast of the peninsula of Malacca, in 3 deg. 12 min. N. latitude, and 105 deg. 40 min. E. longitude. It is pretty large, covered with trees, and the valleys are very pleasant. It is often touched at for wood, water, and other refreshments, and there is great plenty of green turtles.

(3.) Pulo-Way, near the island of Sumatra: it is situated in 5 deg. 40 min. N. lat. and in 21 deg. 47 min. E. long. It is the largest of all those islands which form the entrance of the channel of Achem, and is peopled by culprits who are banished from thence.

(4.) Puna, 120 miles north of Patay. It lies at the entrance of the bay of Guaiquil, in 3 deg. 15 min. S. latitude, and 100 deg. 5 min. W. longitude.

Having given this copious, geographical, descriptive, and historical account of the most remarkable islands in the Indian sea, we shall now return to the Swallow Sloop, which we left at anchor off Prince's Island, in the Strait of Sunday.

Friday the 25th of September, we weighed, and got under sail; for we could not get a sufficient quantity of wood and water at Prince's Island, to complete our stock, the wet monsoon having but just set in, and consequently not rain enough had fell to supply the springs. We would have departed from this part of the island sooner, but we had the wind fresh from the S. E. which made a lee shore; but it being this day in our favour, and more moderate, we worked over to the Java shore. We anchored in the evening, in a bay called by some New, and by others Cauty Bay, which is formed by an island of the same name. In these parts New Bay is the best place for wooding and watering; the water being so clear and excellent, that, in order to get a fresh supply, we staved all that had been taken on board at Batavia and Prince's Island. It is to be had from a fine strong run on the Java shore, which falls down from

the land into the sea, and by means of a hoase it may be laded into the boats, and the casks filled without putting them on shore, which renders the work very easy and expeditious. There is a small reef of rocks within which the boats go, not in the least dangerous, and the boats lie in as smooth water, and as effectually sheltered from any swell, as if they were in a mill-pond; and if a ship, when lying here, should be driven from her anchors by a wind that blows upon the shore, she may, with the greatest ease, run up the passage between New Island and Java, where there is sufficient depth of water for the largest vessel, and a harbour, in which, being land locked, she will find perfect security. Wood may be procured any where, either upon Java or New Island, neither of which at this part are inhabited. In our present station, we had 14 fathoms water, with a fine sandy bottom. The peak of Prince's Island bore N. 13 W. The westernmost point of New Island S. 82 W. and the easternmost point of Java that was in sight, N. E. We were distant from the Java shore a mile and a quarter, and from the watering-place a mile and a half. In a few days having completed our wood and water, we weighed, and stood out of the strait of Sunday, with a fine fresh gale at S. E. which continued till we were distant from the island of Java 700 leagues.

On Monday the 23rd of November, we had in view the coast of Africa; on the 28th, at day-break, we made the land of the Cape of Good Hope; and, in the evening, cast anchor in Table Bay. Here we found only a Dutch ship from Europe; and a snow belonging to the cape, which was in the company's service, for the inhabitants are not permitted to have any shipping. This Bay, in summer, is a good harbour, but not in winter; on which account the Dutch vessels lay here no longer than the 15th of November, after which they go to False Bay, where they are sheltered from the N. W. winds, which blow here with great violence. At this place we breathed a pure air, had wholesome food, went freely about the country, which is exceeding pleasant; and found the inhabitants hospitable and polite; there being scarcely a gentleman, either in a public or private station, from whom we did not receive some civility; and Captain Carteret observes, "he should ill deserve the favours they bestowed, if he did not particularly mention the first and second governor, and the fiscal." We continued near six weeks at the cape, in order to recover our sick.

On Wednesday the 20th of January, in the evening, A. D. 1769, we set sail, and before it was dark cleared the land. After a fine and pleasant passage, on Wednesday the 20th, we anchored off the island of St. Helena, from whence we again sailed on Sunday the 24th. On Saturday the 30th, we came in sight of the N. E. part of Ascension Island, and early in the morning ran in close to it. We sent out a boat to discover the anchoring-place, and in the afternoon came to an anchor in Cross Hill Bay. To find this place, bring the largest and most conspicuous hill upon the island to bear S. E. When the ship is in this position, the bay will be open, right in the middle between two other hills, the westernmost of which is called Cross Hill, and gives name to the bay. A flag-staff is upon this hill, which, if a ship brings to bear S. S. E. half E. or S. E. by E. and runs in, keeping so till she is in 10 fathom water, she will be in the best part of the bay. In our run along the N. E. side of the island, we observed several other small sandy bays, in some of which our boat found good anchorage, and saw plenty of turtle. At this place, where we lay, they also abound. In the evening we landed a few men to turn the turtle, that should come on shore during the night, and in the morning they had secured 18, from 4 to 600 weight each. There being no inhabitants on this island, we, according to a usual custom, left a letter in a bottle, with our names, and destination, the date, and a few other particulars.

On Monday the 1st of February, we weighed, and set sail. On the 19th, we came in sight of a ship, in the south quarter, which hoisted French colours; and on Saturday the 20th, she tacked in order to speak with

us. Her commander, we, after she had left us, found to be M. de Bougainville, whose frequent traces of the English navigators had very remarkably occurred in the course of the three voyages, which they made round the world. This gentleman made a voyage to Falkland's islands, called by the French, after the Dutch, Mauritius, in the year 1765, and was seen by commodore Byron, in the straits of Magellan, as we have related in our history of that voyage. Soon after his return home, he sailed from port L'Orient, in November 1766, on board the Bourdeuse frigate, attended by the Etoile sloop, on a voyage of discovery, and to encompass the world: but being baffled in his attempts to pass the straits of Magellan, he returned to the eastern coast of South America, and wintered at Buenos Ayres. On the return of the season, he renewed his attempt with better success, touched at the island of Juan Fernandez, where he stayed two months, followed Captain Wallis and Captain Carteret, in the manner already related, and, by successfully completing his design, became the first native of France, who had also touched at the world, at least in one continued voyage. At this time he was on his return in the Bourdeuse, having left the Etoile at the Mauritius: he had also touched at the island of Ascension; and after having hailed us, sent an officer on board, in order to receive some letters, which were to be conveyed to France, who, under colour of general conversation, endeavoured to obtain information concerning the route and incidents of our voyage, while by a string of plausible fictions he concealed their own; but Captain Carteret could not be brought to be communicative, so that all the endeavours of the Frenchman proved fruitless: on the other hand, the crew of the boat in which the officer had arrived soon imparted all they knew to those of our sailors who conversed with them. Captain Carteret observes very justly on this transaction, "that an artful attempt to draw him into a breach of his obligation to secrecy, whilst the French commander imposed a fiction, that he might not violate his own, was neither liberal nor just."

We had now a fresh gale, and all our sails set, when the French ship, though foul from a long voyage, and we had been just cleaned, shot by us as if we had been at anchor. On Sunday, the 7th of March, we passed between the western islands of St. Michael and Tercera. As we proceeded farther to the westward, the gale increased, and on the 11th it blew very hard from W. N. W. with a great sea, which blew our fore-sail all to pieces, before we could get the yard down; this obliged us to bring to; and having bent a new sail, we bore away again. On Tuesday, the 16th, we were in latitude 49 deg. 15 min. north, and on the 18th, we found ourselves by the depth of water in the channel. The next day we had a view of the Start-Point; and on the 20th after a fine passage, and a fair wind from the Cape of Good Hope, to our great joy, the Swallow came to an anchor at Spithead: and to what can we ascribe her arriving safe at last, after having gone through, apparently, insurmountable difficulties, but to the merciful interposition of a particular Providence. In following her and her brave crew, through this voyage, our astonishment is excited, not so much at the number and importance of the discoveries made, but that such wants, such embarrassments, and such dangers, as these neglected and devoted people had to encounter, should have been overcome, in a ship that had been thirty years in the service! It is also no less surprising, how it came to pass, that so able and gallant an officer should have been so cruelly treated, when sent upon a service, which, in almost every other instance, has been particularly attended to, and received the most ample supplies: and, to conclude, if we consider the many impediments which lay in the way of Captain Carteret, beyond what any other navigator had to struggle with, we must acknowledge that this voyage does great honour to him as the conductor of it: indeed this sensible officer seems to have been animated with the true spirit of discovery, and to have possessed such an uncommon share of fortitude and perseverance, as nothing short of death could subdue.

NEW, AUTHENTIC, and COMPLETE ACCOUNT and NARRATIVE, of
A VOYAGE Towards the NORTH POLE,
 UNDERTAKEN and PERFORMED

By the Hon. Com. PHIPPS, (now Lord MULGRAVE),

In his Majesty's Ship the RACEHORSE, accompanied by
 Capt. LUTWYCH in the CARCASE Sloop.

TO WHICH IS PREFIXED,

A genuine Account of the several Voyages undertaken for the Discovery of a
 NORTH-EAST Passage to CHINA and JAPAN.

I N T R O D U C T I O N.

IT is fortunate for commerce, and the intercourse of nations, that there is implanted in man's nature a desire of novelty, which no present gratification can satisfy; that when he has visited one region of the earth, he is still, like Alexander, fighting for another to explore; and that, after having escaped one danger in his progress, he is no less eager to encounter others, that may chance to obstruct him in the course of his pursuits.

If the history of former hardships could have deterred men from engaging in new adventures, the voyage, the particulars of which we are now about to relate, would probably never have been undertaken. The dreary regions that surround the poles are so little accustomed to feel the kindly influences of the enlivening sun, and are so destitute of the ordinary productions of the earth in happier climates, that little less than one whole quarter of the globe is, by its sterility, rendered uninhabitable by human beings, and but thinly occupied by a very inconsiderable number of the race of quadrupeds. The many and almost insuperable difficulties that must therefore be expected in traversing these forlorn deserts, where no relief is to be expected, but from the favourable interposition of that power, whose merciful providence extends to the remotest corners of the earth, are, upon reflection, enough to cool the ardour of the most enterprising, and to stagger the resolution of the most intrepid.

In the contention between powers, equally formed by nature to meet an opposition, it may be glorious to overcome; but to encounter raging seas, tremendous rocks, and bulwarks of solid ice, and desperately to persist in attempts to prevail against such formidable enemies; as the conflict is hopeless, so the event is certain. The hardest and most skilful navigator, after exposing himself and his companions to the most perilous dangers, and suffering in proportion to his hardness the most complicated distresses, must at last submit to return home without success, or perish in his perseverance.

This observation will be sufficiently justified, by a brief recapitulation of the voyages that have been undertaken, with a view to the discovery of a north-east passage to China and Japan.

The first who attempted this discovery was Sir Hugh

Willoughby, with three ships, so early as the year 1553, the era of perilous enterprizes. This gentleman sailed to the latitude of 75 degrees north, within sight, as it is imagined, of New Greenland, now called Spitzbergen; but by a storm was driven back, and obliged to winter in the river Arzena, in Lapland, where he was frozen to death with all his company. He left upon his table a concise account of all his discoveries, in which he mentions, having sailed within sight of a country in a very high latitude, about which geographers are divided; some affirming, as has been said, that it could be no other than New Greenland, afterwards discovered, and named by the Dutch Spitzbergen; others, that what he saw was only a fog-bank; and of this latter opinion is Capt. Wood, an able navigator, of whom we shall have occasion to speak hereafter.

To Sir Hugh Willoughby succeeded Captain Burroughs, afterwards Comptroller of the Navy to Queen Elizabeth. This gentleman attempted the passage with better fortune, and returned full of hope, but without success. He passed the North cape in 1556, advanced as far north as the 78th deg. discovered the Wygate, or strait that divides Nova Zembla from the country of the Sammoys, now subject to Russia: and having passed the easternmost point of that strait, arrived at an open sea, from whence he returned, having, as he imagined, discovered the passage so painfully sought, and so ardently desired. Some affirm, his discoveries extended beyond the 80th deg. of latitude, to a country altogether desolate, where the mountains were blue and the valleys snow.

Be that as it may, the favourable report of Captain Burroughs encouraged Queen Elizabeth to fit out two stout vessels to perfect the discovery. The command of these ships was given to the Captains Jackman and Pett, who, in 1580, sailed through the same strait, that had been discovered by Burroughs, and entered the eastern sea; where the ice poured in so fast upon them, and the weather became so tempestuous, that after enduring incredible hardships, and sustaining the most dreadful shocks of ice and seas, terrible even in the relation, they were driven back and separated; and neither Pett nor his ship or crew were ever heard of afterwards.

After

After this disaster and disappointment, the desire of visiting the frozen seas to the N. E. began to abate among the English, but was assumed by the Dutch with an obstinate perseverance, peculiar to that phlegmatic nation. The first Dutchman we read of who made the attempt was John Cornelius, of whose voyage, in 1595, we have but a very imperfect account; he was followed however in 1606 by William Barrans, or, as some write, Barents, an able and experienced seaman and mathematician, who being supplied with every necessary for so hazardous a voyage, by the generosity and patronage of Prince Maurice, proceeded in the same course which had been pointed out to him by the English navigators; but having passed the Wygate, found the like incumbrances, and the like tempests which the English had experienced; and not being able to bear up against them, returned thoroughly convinced, that the wished-for passage was not to be attained in that direction. However, he traversed the coast of Nova Zembla, gave names to several promontories and head-lands, and planned to himself a new course to steer, by which he hoped to accomplish what he had failed in discovering, by following the steps of those who had gone before him.

In 1607, animated rather than discouraged by disappointment, he entered upon his second voyage, with the spirit of a man fully prepossessed with success. He had heard, that some of the whalers, who had now begun to frequent the north seas, had, either by design or accident, advanced much farther to the northward than those who had been purposely fitted out upon discoveries; he therefore determined to steer to the northward of Nova Zembla, till he should arrive at the height of the pole, under which he was persuaded he should find an open sea; and by changing his course to the southward, avoid those obstructions which had retarded his passage to the N. E.

In this hope he continued till he arrived on the coast of Nova Zembla, where before he had reached the 77th deg. he was so rudely attacked by the mountains of ice, that every where assailed him, that not being able to withstand their fury, he was driven against the rocks, and his ship dashed to pieces. Barents and the greatest part of his crew got safe to land, but it was to experience greater misery than those underwent who perished in the attempt. They were obliged to winter in a country, where no living creature besides themselves appeared to have existence; and where, notwithstanding their utmost efforts to preserve their bodies from the cold, the flesh perished upon the bones of some of them, and others died of the most excruciating pains.

In this extremity, and notwithstanding the anguish they endured, those who survived had still the fortitude and ingenuity to frame a pinnace from the wreck of their broken ship, in which, at the approach of summer, they made sail for Lapland; but before they arrived at Colu, their Captain died, and with him the hopes of perfecting his discovery.

It was now the active season for naval enterprizes. Private adventurers began to fit out ships for the north seas. Innumerable sea animals had been observed to bask upon the ice; the tusks of whose jaws were found to excel, in whiteness, the finest ivory, and their carcasses to yield plenty of excellent oil. In the infancy of the whale fishery, these were pursued with the same eagerness, with which both the English and Dutch endeavour at this day to make the whales their prey, and perhaps with no less profit. In following these, many islands were discovered to which they resorted, and, in course of time, the seas that were so formidable to the first discoverers, became frequented at the proper seasons by the ships of every nation.

Foreign navigators, however, were more sanguine in their notions of a N. W. passage, than of the existence of a passage to the N. E. and it was not till many unsuccessful trials had been made to discover the former, that the latter was again attempted. The celebrated Hudson, who discovered the straits that lead to the great western bay, which still bears his name; after he

had exerted his skill in vain to find a passage westward, was persuaded at last to undertake a voyage in search of a passage to the N. E. This he performed in 1610, but being discouraged by the miscarriages of others, and the fatal issue that had attended their obstinate perseverance, on viewing the face of the country, examining the currents, and traversing an immense continent of ice, that stretched along the ocean, in a direction from E. S. E. to W. N. W. he concluded, that no passage could be practicable in that direction, and therefore returned without making any other material discovery.

From this time till the year 1676, the prosecution of this discovery was totally neglected by the English; and though the Dutch whalers amused the world with wonderful relations of their near approach to the pole, yet little credit was given to their reports till the arrival of one John Wood, who had accompanied Sir John Narborough in his voyage to the South Sea, with a view to establish a new trade with the Chilians, and natives of that vast tract of country, reaching from the straits of Magellan to the confines of Peru.

This able and enterprising navigator, being himself an excellent mathematician and geographer, and reading in the Philosophical Transactions a paper, by which the existence of a N. E. passage to the eastern or Indian ocean was plausibly asserted, and this exactly coinciding with his own notions of the construction of the globe, he was induced, by this and other reasons, to apply to king Charles II. for a commission to prosecute the discovery; the accomplishment whereof, it was said, would add to the glory of his majesty's reign, and immensely to the wealth and prosperity of his kingdoms.

Many about the court of that needy prince, hoping to share in the profits of the voyage, were earnest in prevailing with his majesty to forward the design, who being himself fond of novelty, ordered the Speedwell frigate to be fitted out at his own charge, manned, victualled, and provided with every necessary; while the duke, his brother, and seven other courtiers, joined in the purchase of a pink of 120 tons, to accompany her, which they likewise manned and victualled, and furnished with merchandizes, such as were thought marketable on the coasts of Tartary or Japan; the countries they most probably would first fall in with after their passage through the north sea.

These ships being in readiness, and commissions made out for their commanders, Captain Wood was appointed to direct the expedition, on board the Speedwell, and Captain Flawes to bear him company on board the Prosperous.

On the 28th of May 1676, they sailed from the Buoy of the Nore, with the wind at S. W. and on the 4th of June cast anchor off Lerwick, in Brasseley Sound, where they continued six days, to take in water and recruit their stores.

On Saturday the 10th, they weighed anchor and continued their voyage; and on the 15th, they entered the polar circle, where the sun at that season of the year never sets. At noon the Speedwell broke her main-top-sail-yard in the slings, the first disaster that had happened, which, however, was easily repaired. The weather now began to grow hazey, a circumstance that frequently happens in the polar regions, and darkens the air with the obscurity of night.

From this time till June 22, when they fell in with the ice in latitude 75 deg. 59 min. N. nothing material occurred. On that day, at noon, they observed a continent of ice stretching to an imperceptible distance, in a direction from E. S. E. and W. N. W. They bore away along the ice till the 28th, when they found it join to the land of Nova Zembla.

On the 29th, they stood away to the south, to get clear of the ice; but unfortunately found themselves embayed in it. At 11 at night the Prosperous bore down upon the Speedwell, crying out, ice upon the weather-bow, on which the Speedwell clapt the helm hard a weather, and veered out the main-sail to ware the ship; but before she could be brought to on the other tack, she struck on a ledge of rocks, and stuck fast. They fired guns of dis-

treks, but were not heard, and the fog being so thick, that land could not be discerned, though close to the stern of their ship; no relief was now to be expected, but from providence and their own endeavours. In such a situation, no description can equal the relation of the Captain himself, who, in the language of the times, has given the following full and pathetic account.

"Here, says he, we lay beating upon the rock in a most frightful manner, for the space of three or four hours, using all possible means to save the ship, but in vain; for it blew so hard, that it was wholly out of our power to carry out an anchor capable to do us any service. At length we saw land close under our stern, to the great amazement of us all, which before we could not see for the foggy weather; so I commanded the men to get out the boats before our mast came by the board, which was done. I sent the boatswain towards the shore in the pinnace, to see if there was any possibility of landing, which I much feared, because the sea ran so high. In half an hour he returned with this answer, that it was impossible to land a man, the snow being in high cliffs, the shore was inaccessible. This was bad tidings; so then it was high time to think on the safety of our souls, and we went altogether to prayers, to beseech God to have mercy on us, for now nothing but individual ruin appeared before our eyes. After prayers, the weather cleared up a little, and looking over the stern, I saw a small beach directly with the stern of the ship, where I thought there might be some chance of getting on shore. I therefore sent off the pinnace a second time, with some men in her to be first landed, but she durst not venture to attempt the beach. I then ordered out the long-boat with twenty men to land, who attempted it, and got safe on shore. They in the pinnace seeing that, followed, and landed their men likewise, and both vessels returned to the ship without any accident. The men on shore desired some fire-arms and ammunition, for there were many bears in sight. I therefore ordered two barrels of powder, some small arms, some provisions, with my own papers and money, to be put on board the pinnace; but as she put off from the ship's side, a sea overfet her, so that all was lost, with the life of one man, and several others taken up for dead. The pinnace likewise was dashed to pieces, to our great sorrow, as by that disaster, one means of escaping from this dismal country, in case the Prosperous deserted us, was cut off. The long-boat being on board, and the sea running high, the boatswain and some others would compel me and the Lieutenant to leave the ship, saying it was impossible for her to live long in that sea, and that they had rather be drowned than I; but desiring me when I came on shore, if it were possible, to send the boat again for them. Before we got half way to shore the ship overfet, so making all possible haste to land the men we had on board, I went off to the ship again, to save those poor men who had been so kind to me before. With great hazard I got to the quarter of the ship, and they came down the ladder into the boat, only one man was left behind for dead, who had before been cast away in the pinnace; so I returned to the shore, though very wet and cold. We then hauled up the boat, and went up the land about a flight shot, where our men were making a fire and a tent with canvas and oars, which we had saved for that purpose, in which we all lay that night wet and weary. The next morning the man we left on board having recovered, got upon the main-mast, and prayed to be taken on shore, but it blew so hard, and the sea ran so high, that tho' he was a very pretty sailor, none would venture to bring him off.

"The weather continuing blowing with extreme fogs, and with frost and snow, and all the ill-compacted weather that could be imagined put together, we built more tents to preserve ourselves; and the ship breaking in pieces, came all on shore to the same place where we landed, which served us for shelter and firing. Besides, there came to us some hogheads of flour, and brandy in

No. 38.

good store, which was no little comfort in our great extremity. We now lay between hope and despair, praying for fair weather, that Captain Flawes might find us, which it was impossible for him ever to do while the weather continued foggy; but fearing at the same time that he might be cast away as well as we.

"But supposing we never were to see him again, I was resolved to try the utmost to save as many as I could in the long-boat. In order thereunto we raised her two feet, and laid a deck upon her to keep the sea out as much as possible; and with this boat, and thirty men, for she would carry no more, I intended to row and sail to Russia, but the crew not being satisfied who should be the men, began to be very unruly in their mind and behaviour, every one having as much reason to save himself as another, some holding consultation to save the boat, and all to run the like fortune; but here brandy was our best friend, for it kept the men always sox'd, so that in all their designs I could prevent them. Some were in the mind to go by land, but that I knew was impossible to any man; neither had we provisions nor ammunition to defend us from the wild beasts; so the passage by land being impracticable, and no passage by sea to be attempted till forty men were destroyed, I will leave it to the consideration of any, whether we were not in a most deplorable condition, without the interposition of divine providence.

"The weather continued still very bad, with fogs, snow, rain, and frost, till the 9th day of our being on shore, which was the 8th day of July, when in the morning it cleared up, and to our great joy one of our people cried out a sail, which proved Captain Flawes; so we set fire to our town, that he might see where we were, which he presently discovered, so came up, and sent his boat to us; but before I went off, I wrote a brief relation of the intention of the voyage, with the accident that had befallen us, and put it into a glass bottle, and left it in the fortification I had there built; so by twelve o'clock we all got safe on board, but left all on shore that we had saved from the ship; for we much feared it would prove foggy again, and that we should be driven once more on this miserable country; a country, for the most part, covered perpetually with snow, and what is bare being like bogs, on whose surface grows a kind of moss, bearing a blue and yellow flower, the whole product of the earth in this desolate region. Under the surface, about two feet deep, we came to a firm body of ice, a thing never heard of before; and against the ice-cliffs, which are as high as either of the fore-lands in Kent, the sea has washed underneath, and the arch overhanging, most fearful to behold, supports mountains of snow, which, I believe, hath lain there ever since the creation."

Thus far in Captain Wood's own words. He adds, that by the tides setting directly in upon the shore, it may be affirmed with certainty, that there is no passage to the northward. One thing remarkable in his relation, and which seems to contradict the report of former navigators, is, that the sea is there saltier than he had yet tasted it elsewhere, and the clearest in the world, for that he could see the shells at the bottom, though the sea was four hundred and eighty feet deep.

Being all embarked on board the Prosperous, on the 9th of July they changed their course, and steered for England; and, on the 23rd of August, they arrived safe in the Thames, without any remarkable accident intervening.

After the miscarriage of this voyage, on which the highest expectations had been formed, the most experienced navigators in England seemed to agree, that a passage by the N. or N. E. had no existence. They were the more confirmed in this error, for an error it is, by the reasons assigned by Captain Wood, for changing his opinion on this matter; for, before he went upon the discovery, he was fully persuaded himself, and likewise persuaded many others, that nothing was more certain. When, however, he first saw the ice, he imagined it was only that which joined to Greenland, and that no solid body of ice extended farther from land than twenty

leagues; in this persuasion he altered his course, and coasted along in the direction in which the ice lay, expecting, at every cape or head-land of ice, after running a certain distance, to find an opening into the Polar ocean; but after running two or three glasses to the northward in one bay, he found himself entangled in another; and thus it continued till his ship was wrecked. By this experiment, he found the opinion of Barents confuted, namely, "that by steering the middle course between Spitzbergen and Nova Zembla, an open sea might be attained, in which a ship might safely sail as far as the pole." From his own experience, he therefore pronounced, that all the Dutch relations were forgeries which asserted, that any man had ever been under the pole; verily believing, that if there be no land to the northward of 80 degrees, that the sea is there frozen, and always continues so; and grounding his opinion upon this remark, that if the body of ice which he saw were to be conveyed ten degrees more to the southward, many centuries of years would elapse before it would be melted.

To this positive assertion, however, may be opposed, the testimony of many credible persons, some of whom have themselves sailed beyond the 80th degree of north latitude, and others upon evidence whose veracity there is no reasonable cause to bring in question.

Among the latter, the testimony of Mr. Joseph Moxon, member of the Royal Society of London, must have considerable weight. In a paper which this gentleman caused to be printed in the Philosophical Transactions, is this remarkable relation.

"Being about twenty years ago in Amsterdam, I went into a public house to drink a cup of beer for my thirst; and sitting by the public fire, among several people, there happened a seaman to come in, who seeing a friend of his there, who he knew went the Greenland voyage, wondered to see him, because it was not yet time for the Greenland fleet to come home, and asked him, what accident had brought him home so soon? His friend (who was the steerman) answered, that their ships went not out to fish, but only to take in the lading of the fleet, to bring it to an early market. But, said he, before the fleet had caught fish enough to lade us, we, by order of the Greenland Company, sailed unto the north pole, and came back again. Whereupon, says Moxon, I entered into discourse with him, and seemed to question the truth of what he said; but he did assure me it was true, and that the ship was then in Amsterdam, and many of the seamen belonging to her ready to justify the truth of it; and told me, moreover, that they had sailed two degrees beyond the pole. I asked him, if they found no land or islands about the pole? He answered, no; there was a free and open sea. I asked him, if they did not meet with a great deal of ice? He told me, no; they saw no ice about the pole. I asked him, what weather they had there? He told me, fine warm weather, such as was at Amsterdam in the summer-time, and as hot. I should have asked him more questions, but that he was engaged in discourse with his friend, and I could not, in modesty, interrupt them longer. But I believe the steerman spoke truth; for he seemed a plain, honest, and unaffected person, and one who could have no design upon me."

To authenticate this relation it has been observed, that under the poles, the sun in June being 23 degrees high, and having little or no depression towards the horizon, always, as it were, swimming about in the same elevation, might invigorate that part of the hemisphere with more heat than he does our climate; when he is, in the winter, no more than 15 degrees at the highest, and but eight hours above the horizon; in which space the earth has time to cool, and to lose, in the night, the influences of heat which it receives in the day.

Another report upon like evidence was made to King Charles the Second, by Captain Goulden, who being a Greenland whaler himself, spoke with two Hollanders in the North Seas, that had sailed within one degree of the pole, where they met with no ice, but a hollow grown sea, like that in the Bay of Biscay.

A still more credible testimony is, that about the year 1670, application being made to the states general for a charter to incorporate a company of merchants to trade to Japan and China, by a new passage to the north east; the then East India Company opposed it, and that so effectually, that their High Mightinesses refused to grant what the merchants requested.

At that time it was talked of in Holland, as a matter of no difficulty to sail to Japan by the way of Greenland; and it was publicly asserted and believed, that several Dutch ships had actually done it. The merchants being required to verify this fact, desired that the journals of the Greenland Squadron of 1655 might be produced; in seven of which there was notice taken of a ship which that year had sailed as high as the latitude of 89; and three journals of that ship being produced, they all agreed, as to one observation taken by the master, August 1, 1655, in 88 degrees 56 minutes north.

But a proof incontestible, is the testimony of Captain Hudson, who sailed in 1607 to the latitude of 81 deg. 30 min. north, where he arrived on the 16th of July, the weather being then pretty warm.

Add to all these, that the Dutch, who were employed in 1670, in endeavouring to find a N. E. passage, advanced within a very few degrees of that open sea, which is now commonly navigated by the Russians, and which would infallibly have brought them to the coasts of China and Japan, had they persevered in the course they were pursuing.

It does not appear, however, from any authentic accounts that we can collect, that any voyage, professedly for the discovery of a N. E. passage, has been undertaken by either public or private adventurers in England, since that of Captain Wood in the year 1676, till the present year: and it is more than probable, that if the Russian discoveries on the north of Asia had never taken place, the thoughts of finding a practicable passage from Europe in that direction, would have lain dormant for ever.

But the vast and enterprising genius of Peter the Great, in forcing his subjects out of that obscurity in which they had long been involved, has opened to the maritime powers new sources of commerce, and furnished fresh motives for new enterprizes. From a people unacquainted with a vessel bigger than a bark, and who knew no navigation but that of their own rivers, that wonderful Prince not only taught them the use of ships, but instructed them in the true principles of building and equipping them. Nay, he did more; for after making himself known and admired throughout Europe, he conceived the design of opening a communication with the remotest parts of the globe, and discovering to the world new countries which no European nation had ever yet explored.

With this design, he planned one of the boldest enterprizes that ever entered into the heart of man; and though he did not survive to see it executed, the glory of the achievement is wholly his.

The country of Kamtschatka was as much unknown to his predecessors, as it was to the rest of the civilized nations of the earth; yet he formed the design of making that savage country the centre of the most glorious achievements.

It was in the last year of this great Monarch's life, that he commissioned Captain Behring to traverse the wild, and then almost desolate, country of Siberia, and to continue his route to Kamtschatka, where he was to build one or more vessels, in order to discover whether the country towards the north, of which at that time they had no distinct knowledge, was a part of America, or not; and if it was, his instructions authorized him to endeavour, by every possible means, to seek and cultivate the acquaintance of some European people, and to learn from them the state of the country at which he should arrive. If he failed in this, he was to make such discoveries as circumstances should present, and commit to writing the result of his observations for the use of his imperial master.

To enter minutely into the particulars of Captain Behring's

Behring's journey and voyage, would carry us beyond the limits prescribed for this Introduction: let it suffice to say, that after surmounting incredible difficulties, and suffering hardships which none but a Russian could have survived, he executed his commission successfully, and returned to Petersburg in safety, after an absence of five years, in which time, besides his voyage by sea, he had travelled, in going and returning, 18,000 miles by land.

It is from the second enterprizes of this astonishing man, and from the subsequent voyages of the Russians, that we are able to ascertain the existence of a N. E. passage; and it is from thence, and from the late voyage of Captain Phipps, that, we think, we may fairly infer the practicability of it.

It was some time about the year 1740, that Captain Behring embarked on his second voyage from Kamtschatka, of which all that we know is, that he sailed southward to the isles of Japan, and from thence eastward about 80 leagues. At that distance from Japan he discovered land, which he coasted N. W. still approaching to the N. E. cape of Asia, which he doubled, and named Cape Shelvghenski, not daring to land till he arrived at the mouth of a great river, where sending his boats with most of his crew on shore, they never more returned, being either killed or detained by the inhabitants, which made his discovery incomplete; for not having men sufficient left to navigate the ship, she went on shore on an uninhabited island, where the Captain unfortunately died.

From this voyage, however, we learn that the sea, from the N. E. cape of Kamtschatka, is open to the isles of Japan, and from a subsequent account of Russian voyages, published in the Philosophical Transactions, from a paper communicated by the celebrated Euler, it appears, that they passed along in small vessels, coasting between Nova Zembla and the continent, at divers times in the middle of summer, when those seas were open. The first expedition was from the river Ob, latitude 66 deg. N. longitude 65 deg. E. from London, and at the approach of winter, the vessels sheltered themselves by going up the Janiska, the mouth of which is marked in our maps in latitude 70 deg. N. and in longitude 82 deg. E. from whence the next summer they proceeded to the mouth of the Lena in latitude 72 deg. N. and in longitude 115 deg. into which they again retired for the winter season. The third expedition was from the mouth of this river, to the farthest north cape of Asia, in 72 deg. of north latitude, and in 172 deg. of east longitude from London. Thus the Russians having passed between the continent and Nova Zembla, and sailed as far as the easternmost north cape, and the English and Dutch having repeatedly failed through the straits that divide Nova Zembla from the continent, nothing can be a plainer demonstration of the reality of the N. E. passage, than the sum of the voyages here enumerated, when added together. The English and Dutch fail to Wygatz, or the strait of Nova Zembla; the Russians sail from Wygatz to the north cape of Asia; and Behring from the north cape to Japan. This is an incontrovertible demonstration; yet it is obvious, that this course can never be practicable to ships employed in trade. The Russians, by taking the advantage of an open sea and mild weather, in three years time accomplished but part of a voyage, which, by the Cape of Good Hope, may be made in less than one. Who therefore would run the hazard of so desperate a passage, for the sake of reaping imaginary advantages by an intercourse with savages, who, for aught we know, have nothing to exchange for European commodities, but the skins of bears, or the bones of monsters.

But though the passage to the northern countries of the east was known to be impracticable to European navigators in this direction, it was worthy the greatness of a maritime people, to endeavour to determine the possibility of attaining the same end by another course.

The miscarriage and death of Barentz, and the ship-

wreck of Captain Wood, had left the question undetermined whether the regions adjoining to the pole are land or water, frozen or open sea. The advantages from this discovery, besides the glory resulting from it, had the decision terminated in favour of navigation, would have been immensely great. To have opened a new channel of commerce at a time when our trade is languishing, would have revived the drooping hopes of our manufacturers, and retained at home the numerous emigrants, who, for want of employment in their own country, are seeking new habitations, and new means of living in remote settlements, of the certainty of which they have no experience.

It must be acknowledged to the lasting honour of the noble lord who presides at the head of the admiralty board, and who patronized the undertaking, that the means to render it successful, was in every respect proportioned to the importance of the discovery.

The vessels that were made choice of were the properest that could be devised. Bomb ketches are in the first instance stoutly built, and not being over large, are best adapted for navigating seas that are known to abound with shoals and covered rocks: these vessels, besides their natural strength, were sheathed with plank of seasoned oak three inches thick, to fortify them against the shocks and pressure of the ice, that, in their progress, they must infallibly encounter. They were, besides, furnished with a double set of ice poles, anchors, cables, sails, and rigging, to provide against the terrible effects of the severe and tempestuous weather, that frequently happens in high latitudes, even in the middle of the most temperate seasons.

Nor was his lordship less careful to provide for the comfortable subsistence of the men, than for the preservation of their lives, by his wise directions in equipping their ships. His first care was, to issue orders for killing and curing a sufficient quantity of beef and pork in the best manner possible, that their provisions might be good and fresh; and his next, to cause 100 butts of porter to be brewed with the best malt and hops, that they might have proper drink to fortify them against the rigour of the climate they were about to pass. Their pease, oatmeal, rice, and molasses, were all provided with equal care, and when all things were in readiness, the beer was stowed in the holds, and the vacancies filled up with coals, which served as ballast, that firing might not be wanting to warm and dry them when cold, or wet with labour, or with watching. Add to this, that a double quantity of spirits were put on board, with a large proportion of wine, vinegar, mustard, &c. &c. and what, we believe, was never before thought of in the fitting out of any king's ships, a considerable quantity of tea and sugar for the sick, in case any should be seized with that dreadful disorder, which rendered ship provisions loathsome to Captain James's men, who were constrained to winter in Charlton Island in 1632. These men fell sick and had sore mouths, and could neither eat beef, pork, fish, nor potage; the surgeon was every morning and evening obliged to pick their teeth, and cut away the pieces of rotten flesh from their gums, yet they could eat nothing but bread pounded in a mortar, and fried in oil, on which they subsisted for several months. In case of accidents of this kind, and that tea should fail to answer the purposes of nourishment, a quantity of portable soup was likewise provided. And to complete the whole, a stock of warm cloathing was laid in, consisting of six fearnought jackets for each man, two milled caps, two pair of fearnought trowsers, four pair of milled stockings, and an excellent pair of boots, with a dozen pair of milled mitts, two cotton shirts, and two hankerchiefs.

Thus equipped and provided, the command of the Race Horse was given to the Hon. Constantine Phipps, as Commodore, and that of the Carcase to Captain Skiffington Lutwych; the first mounting eight six pounders and 14 swivels, burthen 350 tons; the latter four six pounders and 14 swivels, burthen 300 tons. Let us now proceed to the journal of the voyage.

ALL

ALL things being now in readiness, the officers on board, and the men paid their bounty-money of three pounds per man, according to his Majesty's royal proclamation, for the encouragement of those who should voluntarily enter to undertake the voyage. On the 3rd of June 1773, the Commodore made the signal to weigh; but previous to their departure, the Carcase having been judged too deep to navigate those heavy seas through which she was to pass, the Captain obtained leave from the board of Admiralty to re-land 10 of her complement of men, and to put ashore six of the eight six-pounders with which she was equipped, with a quantity of provisions, proportioned to the number of men that it had been thought proper to discharge.

On Friday the 4th, being off Sheerness, the wind W. by N. and a fresh breeze, they took their departure, and continued their voyage without any material occurrence happening till Tuesday the 15th, when the Commodore made the signal to lie to. They were then off Brassy Island, and many fishing-boats from Shetland being in sight, the men were invited on board, and some fish purchased of them at a cheap rate.

On the 17th, they took a new departure from Shetland, but the day following the fog thickened so much, that it almost approached to total darkness. During the continuance of the fog, the Commodore kept firing guns and beating drums, to prevent the Carcase from losing company. As it was impossible that one could see the other at a ship's length, it was found the more necessary to repeat and return the firing, lest they should run foul of each other before they could be apprized of their danger. About five in the morning the mist cleared up, and about nine the Commodore being in sight, made the signal to the Carcase to steer N. E. They were then in latitude 60 deg. 52 min. N. by observation; the north end of Shetland Island bearing N. by W. one half W. seven or eight leagues.

On the 17th, they observed a sail to the N. E. which the Commodore brought to, and spoke with. The breeze fresh, the weather hazy, and the wind variable, the Carcase carried away her main-top-mast studding sail yard; which, however, was very soon supplied. Latitude this day by observation 62 deg. 53 min. N.

Friday the 18th, being in the latitude of 65 deg. 9 min. N. the cloathing allowed by the government, of which notice has already been taken in the introduction, was delivered out, and officers as well as men received their full proportion. This day the weather continued as before.

Saturday the 19th, the weather varied to every point of the compass, the Commodore brought to, and spoke with the Carcase. Made sail about three in the morning, and at nine a large swell. Tacked and stood to the eastward. Latitude 66 deg. 1 min. N. longitude from London 33 min. W.

Sunday the 20th, they pursued their course to the eastward, with the wind N. W. but variable; high breezes and clear air. They were now within the polar circle, and at mid-night had an observation of the sun, and found their latitude 66 deg. 52 min. N. Sounded on board the Commodore with a lead of 100 weight, and a line of 780 fathom, to which was fastened a thermometer of Lord George Cavendish's construction. They found no bottom, but the water was 11 deg. colder at that depth than on the surface. The Carcase sounded with 450 fathoms only.

Monday 21, light breezes and cloudy weather. They observed a whale on the N. E. quarter, the first they had yet seen in the north seas. The weather now began to set in severe; the nights cold and the days cloudy. The Commodore observing a whaling snow with Ham-borough colours flying, fired a shot, and brought her to. She happened to be homeward bound with seals, and Mr. Wyndham, a gentleman of fortune, who had embarked on board the Commodore, with a view to prosecute the voyage, finding nothing but foul weather and heavy seas, to gratify his curiosity, and being withal unable to endure the sea sickness, took passage on board

the Hamburger, in order to return home; and having taken leave of his friends, by wishing them a happy voyage, the Snow's boat took him on board about seven in the morning, and at eight the Commodore and Carcase pursued their voyage.

Tuesday 22, the articles of war were read on board the Carcase. The weather began to be piercing cold; they had reached the 70th degree of north latitude, in a course nearly north, being only 14 minutes to the eastward of London; and from their leaving Shetland to this day, they had seen nothing remarkable; nor had any accident befallen either of the ships worth relating, except that of now and then snapping a rope, or breaking a yard; incidents easily repaired. This day it poured with rain; the air was thick, and the rain froze as it fell. Saw a large ship to the N. W. standing southward, but wanting no information that she could give, they pursued their voyage without speaking to her.

Wednesday 23, the rain continued; the weather hazy; heard three guns fire at a distance, but saw no ship or other object. The whales are here in no great plenty, and few ships appear in the open sea in pursuit of them. They generally at this season frequent the bays and creeks near the shore, and only break away when they are pursued or wounded.

On Thursday the 24th, the Commodore changed his course to E. N. E. and on the 25th, they were in latitude 74 deg. 7 min. N. and in 8 deg. 32 min. E. longitude from London. Served out to the ship's company plenty of mustard, pepper, vinegar, &c. The weather extremely cold and variable. At eight in the evening thick fog; at two in the morning fresh breezes; at eight clear weather; at eleven squally; and at noon calm, with sleet and snow.

On Saturday the 26th, at midnight, they had an observation, and found themselves in latitude 74 deg. 17 min. N. fresh gales, sometimes rain, sleet, and snow; at seven in the morning clear weather and an open sea.

Sunday 27, light airs from the southward, and cloudy weather; much warmer than the preceding day. It is remarkable, that the vicissitudes of heat and cold are more frequent here than in the more southerly latitudes. It often changes from temperate to extreme cold; and that suddenly.

It should seem likewise, that the ice frequently changes its place in this latitude; or that it is more solid near land than in the open sea; for, on the 23rd of June, 1676, Captain Wood, being more to the eastward, fell in with ice right a-head, not more than a league distant. He steered along it, thinking it had openings, but found them to be bays. He sounded, and found ground at 158 fathom, soft green oar. In some places he found pieces of ice driving off a mile from the main body in strange shapes, resembling ships, trees, buildings, beasts, fishes, and even men. The main body of ice being low and craggy, he could see hills of a blue colour at a distance, and valleys that were white as snow. In some places he observed drift wood among the ice. Some of the ice he melted, and found it fresh and good. This navigator never could advance farther to the north; but in seeking to penetrate the ice was ship-wrecked, as has been already related in the Introduction. He therefore judged the ice impenetrable, and that land or ice surrounded the pole. Our navigators found also much wood in this latitude floating about the ships, and saw great flocks of birds.

Monday 28, the weather altered; the wind west. Fresh breezes, with rain and sleet. Latter part thick fog.

Tuesday 29, being in latitude 78 deg. N. and in longitude 6 deg. 29 min. E. from London, came in sight of land, when the ships brought to, and the Captains held a consultation concerning their future course. The appearance of the land lay from E. S. E. to N. E. and this day they spoke with the Marquis of Rockingham, Greenlandman, who by their reckoning, were

then in latitude 79 deg. 40 min. N. though by that of the Commodore, their latitude was only 78 deg. 3 min. This difference, it is probable, arises from not making the proper allowance for refraction in this high latitude. The Greenlandmen presented each of the Commanders with a deer and a half, which they found well-flavoured venison, though not over fat. He likewise informed, that he had just come from the ice, and that the day before, three whalers had been crushed to pieces by its closing upon them suddenly.

Wednesday 30, pursued their course. Cloudy weather. Half past four in the morning founded 112 fathoms, soft blue mud. At this time Black Point, so called from its dark appearance, bore N. E. by E. three quarters E. at the distance of seven or eight leagues. At half past seven in the morning, saw two sail in the N. W. quarter. At half past twelve tacked and stood to the east. Sounded, and found ground at 115 fathom.

Thursday July 1, light breezes and clear weather at midnight: the sun as bright as at noon day. Black Point E. one half S. distant seven leagues. At three in the morning made Charles's Island, and at nine saw a sail to the westward whaling; they were then in latitude 78 deg. 18 min. N. by observation. Sounded, and found the same depth as before.

Friday 2, light airs and moderate weather. Lay to and took the altitude of a mountain, which they named Mount Parnassus; found it from the level of the sea to be 3960 feet high, covered with snow, and at a distance resembling an ancient building, with something like a tower a-top. The foot of this mountain, with the hills adjoining, have sometimes a very fiery appearance, and the ice and snow on their sides resembling trees and shrubs, glisten with a brilliancy that exceed the splendor of the brightest gems. When this happens, a violent storm generally succeeds. Here they shot some sea fowl, but of an oily taste.

Saturday 3, proved a perfect calm. They spoke with a Hollander, who foretold, that a degree or two farther north was the utmost extent of their progress this season. Having doubled Cape Cold, they anchored in 15 fathom water, about three miles from the land, and sent the boats ashore for water, which they found in abundance, pouring down in little streams from the rocks. At five in the afternoon, by the mean of four azimuths, the variation was found to be 18 deg. 36 min. W. Sounded, and found only 65 fathoms, soft brown mud. Mount Parnassus E. N. E. three or four leagues. Among other reasons which Captain Wood gave for wishing to be employed on the discovery of the N. E. passage, one was, that he might have an opportunity of approaching the pole, in order to settle an hypothesis, which he had long framed, whereby the inclination of the magnetical needle under the horizon, in all latitudes and in all longitudes, with the variation of the compass, might be exactly determined. This navigator imagined two magnetical poles to exist: and that, by approaching the one, he should be able to determine the action of the other. It does not appear, that he ever explained his hypothesis; and there never has been but one man, whose name was Williams, since his time, who pretended to know any thing of the matter.

Sunday 4, light breezes and hazy weather. Sounded, and only 20 fathoms deep; rocky ground. Hacluit's Headland, or the northernmost point of Spitzbergen, bearing N. by E. seven leagues. Many whalers in sight. Latitude by observation 79 deg. 34 min. N. longitude from London 8 deg. 10 min. E. Thermometer 47.

Monday 5, at two in the afternoon sounded, and only 15 fathom water; rocky ground. Thick fog. The Race Horse fired guns as signals to keep company, which were answered by the Carcase. A dreadful crackling was heard at a distance, which proved the dashing and grinding of the loose pieces of ice against each other, which is heard at many leagues distance. Hacluit's Headland S. E. by S. distance six or seven leagues.

No. 39.

Tuesday 6, proved very foggy; the breezes slight, and islands of ice beginning to appear. At three in the afternoon the Commodore hauled up from a large body of packed ice, and the fog thickening, both ships kept firing volleys of small arms, to prevent their losing company. At half past ten in the evening, the extremes of the ice stretching from N. W. to E. N. E. the Commodore bore away; and at half past twelve lost sight of it. At half past one in the morning heard a violent surf to the S. E. At two tacked and stood to the westward. At half past five the fog gathering, they began firing volleys of small arms. At six saw the ice stretching from E. by S. to N. by E. and at seven was within sight of land. At ten Cloven Cliff stood E. S. E. distant about five or six leagues.

Wednesday the 7th, the weather cloudy. They found themselves beset among the loose ice, which increasing continually, gave them incredible trouble. Observing that it thickened to the eastward, they hauled up, and stood to the westward; but in tacking, they were in danger of running foul. It was with difficulty they could keep any course, for the drifts of ice came so thick, as to whirl the ships about, as if in a whirl-pool.

Thursday 8, the weather still remaining cloudy, and the wind variable, both ships still were entangled in the ice; and the Carcase being driven to leeward, hoisted out her long-boat to tow up with the Commodore. But the ice closing very fast, it was impossible for the boats to live. Orders were then given to tack and stand to the southward; but the ships not being able to make head against the accumulation of ice that continually gathered round them, were under a necessity of applying to their ice-anchors and poles, in order to warp through it. At half past eight in the evening, the ice beginning to open, they again hoisted out their boats, and with difficulty towed the ships round a cape of ice projecting from the main body, and at last got clear. At ten the boats were hoisted on board. In extricating themselves from this dangerous situation, the Race Horse had her best bower-anchor snapt in the shank, close to the stock, and the Carcase lost her starboard bumpkin and head-rails.

It frequently happens, that ships beset among the ice in the manner above related, perish by being dashed to pieces against the solid fields of ice, or crushed by the broken pieces crowding upon one another, and rising so fast about the ship, as to exceed the height of her sides, and then there is no escaping. They were told by some experienced seamen, that the ice rises out of the sea as high sometimes as mountains; and that several of these mountains, by striking together and coalescing, form these islands of ice that are frequently seen in the lower latitudes, driving up and down the sea as the wind and tides direct them.

The greatest danger to be apprehended, is, however, from the loose ice; for the whalers often moor their ships to the solid fields of ice, that at certain seasons seem to rest upon the earth, and appear fixed to it, and there find the best fishing. In such situations it often happens, that little or no loose ice is to be seen; yet presently upon a change of wind, or the blowing of a storm, it shall pour in upon them so suddenly, that they sometimes perish in it. It is not possible to account for the astonishing quantity that will gather in this manner in less than an hour's time.

Though it seems to be agreed, that many of the largest fields of ice are frozen to the depth of the sea in which they are found, and that they are bedded on the solid earth, yet it is equally certain, that they are often rent asunder by the raging billows; and that in breaking, they produce the most terrifying noise in nature; nay, it is asserted, that the clashing of the pieces of loose ice against each other, on any extraordinary agitation of the waves, is attended with a roaring so loud, that a man who is near it can hardly hear the sound of his own voice.

Friday the 9th, they hauled up to the westward, and lost sight one of the other; but about nine next morning they came in sight, and joined company. The

4 M

weather

weather being now piercing cold, the people had an additional quantity of porter and brandy delivered to them; two quarts of porter and a pint of brandy being now every man's daily allowance.

Saturday July the 10th, the breeze fresh, and the weather cloudy. They sailed between numberless pieces of ice, among which they saw several whales, but none of the whalers in pursuit of them. The ice now becoming solid and compact, they found it impracticable to continue their course. And the discovery of a passage to the pole in that direction (upon holding a consultation) appearing impracticable to every officer on board of both ships, the Commodore, at seven in the evening, hauled close to the wind; and the Carcase, as soon as she could extricate herself followed his example. The weather continuing foggy, with rain and snow, the sailors were almost worn out with turning and winding; and although they used the utmost precaution in working through the narrows, yet they could not always avoid striking against the mountains that every where surrounded them. During this night's work, they steered a hundred different courses, to follow the channels.

Sunday 11, having worked out of the ice, they sailed along the main body, which appeared perfectly solid and compact, without any passage or inlet. This immense mass of ice extended N. E. as far as they could see from the mast-head; and, no doubt, might be a continuation of that in which they were engaged a few days before. The sea was now tolerably clear, for they met with no more fields, and only a few detached islands. At half past one in the morning they saw the land from S. by W. to S. S. E. At three in the morning they tacked; Cloven Cliff bearing S. S. E. six miles. At seven tacked again. At eight the Commodore bore away, and the Carcase stood after him. Cloven Cliff S. one half W. two or three leagues, latitude 79 deg. 56 min. N.

Monday 12, at eight in the evening Cloven Cliff bearing W. S. W. four or five miles, they founded in 15 fathoms water, and found a rocky bottom. Saw several English and Dutch Greenlanders at anchor in the Norways: That being their rendezvous to the northward, they never chuse to proceed farther. Here they found the current setting so fast to eastward, that they were forced to come to an anchor to keep from drifting on the ice; the swell from westward being so great, that had that happened, it would of consequence have stove the ships. At five in the morning a breeze from N. N. E. springing up, they weighed, and made sail. At eight Hacluit's Headland W. S. W. one half W. six or seven leagues, at noon, latitude 80 deg. 2 min. N.

Tuesday 13, the weather being clear and calm, and a strong easterly current setting in, at eight in the evening they came to with their stream anchors and hauers in forty fathoms water; but at nine a breeze springing up from the eastward, they weighed, and next day came to an anchor in Smearingburgh Harbour. Cloven Cliff E. one half S. one mile. West point of Voogele Land N. N. W. one half W. distant one mile and a half; soundings 15 fathom, sandy bottom.

Here they remained between five and six days to take in fresh water, during which time our journalist was employed in surveying the country, which to a stranger had a very awful and romantic appearance.

The country is stoney, and as far as can be seen full of mountains, precipices and rocks. Between these are hills of ice, generated, as it should seem, by the torrents that flow from the melting of the snow on the sides of those towering elevations, which being once congealed, are continually increased by the snow in winter, and the rain in summer, which often freezes as soon as it falls. By looking on these hills, a stranger may fancy a thousand different shapes of trees, castles, churches, ruins, ships, whales, monsters, and all the various forms that fill the universe. Of the ice-hills there are seven, that more particularly attract the notice of a stranger. These are known by the name of the Seven Icebergs, and are thought to be the

highest of the kind in that country. When the air is clear, and the sun shines full upon these mountains, the prospect is inconceivably brilliant. They sometimes put on the bright glow of the evening rays of the setting sun, when reflected upon glass, at his going down; sometimes they appear of a bright blue, like sapphire, and sometimes like the variable colours of a prism, exceeding in lustre the richest gems in the world, disposed in shapes wonderful to behold, all glittering with a lustre that dazzles the eye, and fills the air with astonishing brightness.

Smearingburgh harbour, where they landed, was first discovered by the Dutch. Here they erected sheds and conveniences for boiling the oil from the fat of the whales, instead of barrelling it up to be boiled at home. Here also, allured by the hope of gain, they built a village, and endeavoured to fix a colony: but the first settlers all perished in the ensuing winter. The remains of the village may be traced to this day; and their stoves, kettles, kardsels, troughs, ovens, and other implements, remained in the shape of solid ice long after the utensils themselves were decayed. Our voyagers were told, that the Russians have lately attempted the same thing, and that 10 out of 15 perished last winter in this second attempt.

Where every object is new, it is not easy for a stranger to fix which first to admire. The rocks are striking objects: before a storm they exhibit a fiery appearance, and the sun looks pale upon them, the snow giving the air a bright reflection. Their summits are almost always involved in clouds, so that it is but just possible to see the tops of them. Some of these rocks are but one stone from bottom to top, appearing like an old decayed ruin. Others consist of huge masses, veined differently, like marble, with red, white, and yellow, and probably, were they to be sawed and polished, would equal, if not excel, the finest Egyptian marble we now so much admire. Perhaps the distance and danger of carrying large blocks of stones, may be the reason that no trials have been made to manufacture them. On the southerly and westerly sides of these rocks grow all the plants, herbs, and mosses peculiar to this country; on the northerly and easterly sides the wind strikes so cold when it blows from these quarters, that it perishes every kind of vegetable. These plants grow to perfection in a very short time. Till the middle of May the whole country is locked up in ice; about the beginning of July the plants are in flower, and about the latter end of the same month, or beginning of August, they have perfected their seed. The earth owes its fertility, in a great measure, to the dung of birds, who build and breed their young here in the summer, and in the winter repair to more favourable climates.

The plants that are most common in Spitsbergen are scurvy-grass and crows-foot; there are besides small house-leak, and a plant with aloe-leaves; an herb like stone-crop; some small snake-weed; mouse-ear; wood-strawberry; periwinkle; and a herb peculiar to the country which they call the rock-plant. The leaves of this plant are in shape like a man's tongue; above six feet long, of a dull yellow colour. The stalk is round and smooth, and of the same colour with the leaf; it rises tapering, and smells like muscles. It is an aquatic, and rises in height in proportion to the depth of water in which it is found. There are other plants and herbs, but these are the chief. Of flowers, the white poppy seems the principal.

The rocks and precipices are full of fissures and clefts, which afford convenient harbour for birds to lay their eggs, and breed their young in safety. Most of these birds are water-fowl, and seek their food in the sea. Some, indeed, are birds of prey; and pursue and kill others for their own sustenance, but these are rare. The water-fowl eat strong and fishy, and their fat is not to be endured. They are so numerous about the rocks, as sometimes to darken the air when they rise in flocks; and they scream so horribly, that the rocks ring with their noise.

There

There are a few small birds like our snipes, and a kind of snow-bird, but different from that found about Hudson's bay. The gentlemen shot some of the water-fowl, but they were strong and ill-tasted.

The ice-bird is a very beautiful little bird, but very rare. He is in size and shape like a turtle-dove, but his plumage, when the sun shines upon him, is of a bright yellow, like the golden ring in the peacock's tail, and almost dazzles the eye to look upon it.

The other inhabitants of this forlorn country are white bears, deer, and foxes. How these creatures can subsist in the winter, when the whole earth is covered with snow, and the sea locked up in ice, is hardly to be conceived. It has been said, indeed, that when the ocean is all frozen over, and no sustenance to be procured in this country, they travel southerly to the warmer climates, where food proper for them abounds in the immense forests of the northern continent. But whoever considers the vast distance between Spitzbergen and the nearest parts of the northern continent, will be as much at a loss to account for the subsistence of these creatures in their journey, as in the desolate region where they undoubtedly remain. The bear is by far the best accommodated to the climate of which he is an inhabitant. He is equally at home on land and water, and hunts diligently for his prey in both. In summer he finds plenty of food from the refuse of the whales, sea-horses and seals, which is thrown into the sea by the whalers, and cover the shores during the time of whaling; and they have besides a wonderful sagacity in smelling out the carcasses of the dead, let them be ever so deeply buried in the earth, or covered with stones. The dead therefore that annually are buried here may contribute, in some degree, to the subsistence of a few of these creatures in winter; but the question will still recur, how the race of them subsisted before the whale-fishery had existence, and before men found the way to this inhospitable shore. Disquisitions of this kind, as they are beyond the reach of human comprehension, serve only to raise our admiration of that omnipotent Being to whom nothing is impossible.

These creatures, as they differ in nothing but their colour and size from those commonly shewn in England, need no description.

The foxes differ little in shape from those we are acquainted with, but in colour there is no similitude. Their heads are black, and their bodies white. As they are beasts of prey, if they do not provide in summer for the long recess of winter, it were, one would think, almost impossible for them to survive; yet they are seen in plenty, though, by their subtlety and swiftness, they are not easy to be caught.

The Dutch seamen report, that when they are hungry they will feign themselves dead, and when the ravenous birds come to feed upon them, they rise and make them their prey.

But the most wonderful thing of all is, how the deer can survive an eight months famine. Like ours they feed upon nothing that can be perceived, but the vegetables which the earth spontaneously produces; and yet for eight months in the year, the earth produces neither plant, herb, shrub, or blade of any kind of grass whatever. They are, besides, but thinly clothed for so severe a climate, and what seems still worse, there is not a bush to be seen to shelter them, within the distance that any man has yet discovered. The means of their subsistence must therefore remain among the secrets of nature, never to be disclosed, as no human being can ever live here, so as to be able to trace these creatures to their winter's residence.

Amphibious creatures abound the most about the sounds and bays of Spitzbergen, and they seem best adapted to endure the climate. These are the seals, or sea dogs, and morises, or sea horses; of which the whalers avail themselves, when disappointed in completing their lading with the fat of whales.

The seal is sufficiently known; but the sea-horse, as it is a creature peculiar to high latitudes, is therefore more rare. It is not easy to say how he came by his

name; for there is no more likeness between a sea-horse and a land-horse, than there is between a whale and an elephant. The sea-horse is not unlike the seal in shape. He has a large round head, larger than that of a bull, but shaped more like that of a pug-dog without ears, than any other animal we are acquainted with. He tapers all the way down to the tail, like the fish we call a lump, and his size is equal to that of the largest sized ox. His tusks close over his under jaw, like those of a very old boar, and are in length from one foot to two or more, in proportion to the size and age of the animal that breeds them. His skin is thicker than that of a bull, and covered with short mouse-coloured hair, which is sleeker and thicker, just as he happens to be in or out of season when he is caught. His paws, before and behind, are like those of a mole, and serve him for oars when he swims, and for legs to crawl when he goes upon the ice, or on shore. He is a fierce animal, but being unweildy when on land, or on the ice, is easily overcome.

These animals are always found in herds, sometimes of many hundreds together, and if one is attacked, the rest make a common cause, and stand by one another till the last gasp. If they are attacked in the water, they will fight desperately, and will even attempt the boats of their pursuers, if any of them are wounded, and not mortally. Some of them have been known to make holes in the bottom of the boat with their tusks, in defence of their young. Their eyes are large, and they have two holes in the upper part of the neck, out of which they eject the water, in like manner as it is ejected by whales.

Though the sea about Spitzbergen is full of fish, yet they rather appear to be designed by Providence for the sustenance of one another, than for the food of man. The mackarel, of which there are no great plenty, seem not only to be the most wholesome, and the most palatable, but also the most beautiful. They seem to be a different species to those caught upon our coasts. The upper part of the back is of a vivid blue; the other part as low as the belly of a gem-like green or an azure ground. Underneath the belly the colour is a transparent white, and the fins shine like polished silver. All the colours glow when alive in the sea with such a richness, that fancy can hardly form to itself any thing in nature more beautiful. Almost all the other fish on this coast are of an oily nature, and of a very indifferent flavour.

The saw, or sword-fish, is remarkable not only for the oddity of his shape, but also for his enmity to the whale. This fish takes his name from a broad flat bone, in length from two to four feet, which projects from his nose, and tapers to a point. On each side, it has teeth like a comb, at the distance of a finger's breadth asunder. He is also furnished with a double row of fins, and is of astonishing strength in the water. His length from ten to twenty feet. He seems to be formed for war, and war is his profession. The conflict betwixt him and the whale is dreadful, yet he never gives over till his sword is broken, or he comes off victorious.

The whale is a harmless fish, and is never known to fight but in his own defence. Yet when he is exasperated, he rages dreadfully. Though from his magnitude, he may be called the sovereign of the seas; yet, like other sovereigns, he is liable to be vexed and hurt by the meanest reptiles. The whale's louse is a most tormenting little animal. Its scales are as hard as those of our prawns; its head is like the louse's head, with four horns, two that serve as feelers, the other two are hard, and curved, and serve as clenchers to fix him to the whale. On his chest, underneath, he has two carvers like scythes, with which he collects his food, and behind these are four feet, that serve him for oars. He has, moreover, six other clenchers behind, with which he can rivet himself so closely to his prey, that he can no otherwise be disengaged, but by cutting out the whole piece to which he is joined. He is jointed on the back like the tail of a lobster, and his tail covers him like a shield when he is feeding. He fixes himself

on the tenderest parts of the whale's body, between his fins, on his sheath, and on his lips, and eats pieces out of his flesh, as if eaten by vultures.

They found no springs of fresh water in Spitzbergen; but in the valleys, between the mountains, are many little rills caused by the rain and melting of the snow in summer; and from these rills the ships are supplied. Some are of opinion, that this water is unwholesome, but they are more nice than wise. The whaling people have drank of it for ages, and have found no ill effects from the use of it. Ice taken up in the middle of these seas and thawed, yields also good fresh water.

On board the *Race Horse*, Dr. Irvine, the gentleman who received the premium by a grant of parliament, for his discovery of an easy process for making salt-water fresh at sea, tried many experiments at Spitzbergen, and in the course of the voyage; the result of which will appear at a proper time. That gentleman had formed a project for preserving flesh-meat fresh and sweet in long voyages, but it did not answer in this.

In calm weather they remarked, that the sea about the islands appeared uncommonly still and smooth; that it was not suddenly moved at the first approach of blowing weather; but that when the storm continued, the waves swelled gradually, and rose to an incredible height. These swelling waves successively follow one another, and roll along before the wind, foaming and raging in a frightful manner, yet they are thought less dangerous than those that break short, and are less mountainous.

They observed likewise, that the ice that rested on the ground was not stationary, but that it changed place; and they learnt also, that in some seasons there was no ice, where this season they were in danger of being embayed. There does not, however, from thence appear the least reason to conclude, that any practicable passage to the Indian ocean can ever be found in this direction; for were it certain that the seas were always open under the pole, yet great bulwarks of ice evidently surround it, sometimes at a less, and sometimes at a greater distance. Moreover, were it possible that chance should direct some fortunate adventurer to an opening at one time, it would be more than a million to one, if the same opening were passable to the next who should attempt it.

There are many harbours about Spitzbergen, besides that of Smearingburg, where ships employed in the whale fishery take shelter in stormy weather; and there are some islands, such as Charles's Island, the Clifted Rock, Red-Hill, Hacluit's Headland, &c. that serve as land-marks, by which seamen direct their course. These islands are full of the nests of birds; but their eggs are as nauseous as the flesh of the fowls that lay them. The sailors sometimes eat them, but they are filthy food. Even the geese and ducks on the neighbouring islands eat fishy and strong.

The air about Spitzbergen is never free from icicles. If you look through the sun-beams transversely as you sit in the shade, or where you see the rays confined in a body, instead of dark motes, as are seen here, you see myriads of shining particles that sparkle like diamonds; and when the sun shines hot, as it sometimes does, so as to melt the tar in the seams of ships when they lie sheltered from the wind, these shining atoms seem to melt away, and descend like dew.

It is seldom that the air continues clear for many days together in this climate; when that happens, the whalers are generally successful. There is no difference between night and day in the appearance of the atmosphere about Spitzbergen, one being as light as the other, only when the sun is to the northward, you may look at him with the naked eye, as at the moon, without dazzling. The fogs here come on so suddenly, that from bright sun-shine, you are presently involved in such obscurity, that you can hardly see from one end of the ship to the other.

While our journalist was busy in making his observations, all belonging to the ships were differently en-

gaged in one employment or other; some in taking in water, some in fishing, some in hunting, some in banding the sails, and spreading them out to dry, some in scrubbing the ship, and some in viewing the country. The Commanders and officers, with Mr. Lyon, Mr. Robinson, &c. busied themselves in making observations, being furnished with an apparatus, that is said to have cost at least 1500 pounds. From such a set of instruments, in the hands of the ablest observers, the nation can boast, some very considerable discoveries in the phenomena of the polar regions may be expected. They landed their instruments in a small island, in Vogle Sound, and had several opportunities during their stay of using them to advantage. Having erected two tents, the Captains from the fishery frequently visited the observers, and expressed their admiration not only at the perfection of the instruments, but likewise at the dexterity with which they were accommodated.

The ice began to set in apace, yet the weather was hot. The thermometer from 56 in the cabin rose to 90 in the open air. It was still 10 deg. higher on the top of a mountain to which it was carried. The island on which the experiments were made, they called Marble Island, from the rock by which it is formed. Having watered, and finished their observations, the ships prepared to depart.

Monday July the 19th, the Commodore made the signal to weigh; at two in the afternoon the ships were under sail, and as soon as they had made their offing, stood to the eastward. At three they tacked and steered northward; and before four were again entangled among the loose ice, through which they failed, directing their course along the main body, which lay from N. W. to S. S. E.

Tuesday the 20th, they continued their course along the ice, but could discover no opening, though they searched every creek, and left no bay or turning unexamined. This day they observed what the sailors call a mock-sun, a phenomenon well enough known in this climate. Hacluit's Headland bore S. W. one half S. 46 leagues; the weather cloudy, with rain; excessive cold. Thermometer 37 deg. 46 min.

Wednesday the 21st, the severity of the weather increasing, an additional quantity of brandy was served out to the people, and every comfortable refreshment afforded them, that they themselves could wish or require. The course of the ice lay this day N. E.

Thursday 22, nothing remarkable.

Friday the 23rd, they saw land from E. by S. to S. E. by S. At four in the morning, Hacluit's Headland bore S. E. 10 leagues; the wind variable, and the weather cold, with sleet and snow. Thermometer 40 deg.

Sunday 25, they had gentle breezes, with cloudy weather, and were engaged among some pieces of ice, separated from the main body, which kept them continually tacking and luffing. At length they entered among mountains and islands of ice, which came upon them so fast, that it was with the utmost difficulty they could proceed; the Carcase having several times struck against them with such violence, as to raise her head four feet out of the water. They now imagined, from the solidity and extent of these islands, that the late strong gales had caused a separation from the main body, the Commodore therefore changed his course with a strong gale to the eastward; in the morning the weather became moderate.

Monday 26, at seven in the morning, they came in sight of Red Hill, a small mount which commands an open plain, known by the name of Deers Field, by reason of its fertile appearance, it being the only spot on which they saw no drifts of snow. To the eastward lies Muffin's Island. Here they founded, and found 45 fathoms water; rocky ground. Captain Lutwyche sent out the long boat, with orders to sound along the shore, and to examine the soil. This island is about a mile long, very low, and looks at a distance like a black speck. Though the soil is mostly sand and loose stones, and

and hardly so much as a green weed upon it, yet it is remarkable for the number of birds that resort to it in summer to lay their eggs, and breed their young; and these not of one kind only, but of many different sorts, as geese, ducks, burgomasters, ice-birds, malamucks, kirmews, rotgers, and almost every other species of birds peculiar to the climate; inasmuch, that the eggs were so numerous, and lay so thick upon the ground, that the men who landed found it difficult to walk without filling their shoes.

While the crew of the boat, 10 in number, with their valiant officer at their head, were examining the island, after having founded the shores, they observed two white bears making towards them, one upon the ice, the other in the water. Major Buz, for that was their officer's travelling title, like Falstaff, was always the boldest man in company over a cup of sack, and minded killing a bear no more than killing a gnat; but seeing the bears approach very fast, especially that which came in the water, he ordered his men to fire while yet the enemy was at a distance, as he did not think it prudent to hazard the lives of his little company in close fight. All of them pointed their muskets, and some of the party obeyed orders; but the greater part judging it safer to depend upon a reserved fire, when they had seemingly discharged their pieces, pretended to retreat. The Major, a full fathom in the belly, endeavoured to waddle after his companions; but being soon out of breath, and seeing the bear that came in the water had just reached the shore, thought of nothing now but falling the first sacrifice. His hair already stood an end; and looking behind him, he saw the bear at no great distance, with his nose in the air snuffing the scent. He had all the reason in the world to believe it was him that he scented, and he had scarce breath enough left to call to his men to halt. In this critical situation he unfortunately dropt his gun, and in stooping to recover it tumbled against a goose-nest, fell squath upon his belly into it, and had very nigh smothered the dam upon her eggs. The old saying is, misfortunes seldom come alone. Before he could well rise, the enraged gander came flying to the assistance of his half-smothered consort, and making a dart at the eye of the assailant, very narrowly missed his mark, but discharged his fury plump upon his nose. The danger now being pressing, and the battle serious, the bear near, and the gander ready for a second attack, the men, who had not fled far, thought it high time to return to the relief of their leader. Overjoyed to see them about him, but frightened at the bear just behind him, he had forgot the gander that was over his head, against which one of the men having levelled his piece, fired and he fell dead at the Major's feet. Animated now by the death of one enemy, he recovered his gun, and faced about to assist in the attack of the second. By this time the bear was scarce 10 yards from him, and beginning to growl, the Major just in the instant was seized with a looseness, dropt his accoutrements, and fell back, that he might not be in the way of his party to impede the engagement. In the hurry he was in, for in a man of such valour, we must not say the fright, he entangled his buttons, and not being able to hold any longer, he filled his breeches. The crew in an instant had brought down the bear, and now it was time for their leader to do something great. Having recovered his arms, and seeing the poor beast groveling on the ground, and growling out his last, like a ram in a pinfold, making a short race backwards in order to redouble his force, he came with nine long strides forwards, and with the strength and fierceness of an enraged bull, thrust his lance full four feet deep in the dying bear's belly. And now, says the Major, cocking his hat, have not I done for the bear bravely! The sailors, who are always in a good humour upon such occasions; but Captain, said they, you have but half done your work, you have another bear to kill yet. The Major, whose situation began to be troublesome, content with the honour he had already acquired, my lads, said he, as I have been the death of one bear, sure six

No. 39.

of you may kill the other; so ordering four of them to row him on board, he left the remaining six to kill the other bear.

On this island two bears were killed, and a sea-horse. The sea-horse made a desperate defence, being attacked in the water; and had there been only one boat engaged in the combat, he certainly would have come off victorious; but the crew of the Race Horse having learnt that there were bears and sea horses on this little spot, were willing to share in the sport of hunting them, as well as in the pleasure of tasting their flesh. They accordingly landed in their boats, and came in good time to assist in pursuing the conquest. It happened, however, that their ammunition being almost spent, one great bear came up to revenge the death of his fellows, and advanced so furiously, growling and barking, that he put the whole company to flight, and some of them, it is said, had no great reason to laugh at the Major.

On founding the shores they remarked, that when the north islands bear N. 45 E. seven or eight leagues, and Red Hill E. by S. five miles, there is generally from 25 to 30 fathom hard ground; but that closer on shore, when Red Hill bears E. one-fourth S. about one mile, it increases to 115 fathom, with soft black mud. The current about one mile an hour to the N. E.

Tuesday 27, the air being perfectly serene, and the weather moderate, the fishes seemed to enjoy the temperature, and to express it by their sporting. The whales were seen spouting their fountains towards the skies, and the fin-fish following their example. They likewise this day saw dolphins; the whole prospect in short was more pleasing and picturesque than they had yet beheld in this remote region. The very ice in which they were beset looked beautiful, and put forth a thousand glittering forms, and the tops of the mountains, which they could see like sparkling gems at a vast distance, had the appearance of so many silver stars illuminating a new firmament. But this flattering prospect did not continue long. By an accurate observation, they were now in longitude 80 deg. 47 min. N. and in longitude 21 deg. 10 min. E. from London; and in sight of seven islands to the north, to which they directed their course.

Wednesday 28, they had fresh easterly breezes, which, from moderate weather the day before, changed to piercing cold. At midnight the west end of Weygate Straits bore S. by E. so that they were now in the very spot where Barentz had supposed an opening would be found into the polar sea. Yet so far from it, they could discover nothing from the mast head, but a continued continent of solid ice, except the islands already mentioned. On this ice, however, there were many bears, some of which came so near the ships as to be shot dead with small arms. These bears are very good eating, and where no better is to be purchased, the whalers account them as good as beef. They are many of them larger than the largest oxen, and weigh heavier. In many parts of their body they are musket proof, and unless they are hit on the open chest, or on the flank, a blow with a musket ball will hardly make them turn their backs. Some of the bears killed in these encounters weighed from 7 to 800 weight; and it was thought, that the bear that routed the sailors on Muffin's Island, could not weigh less than 1000 weight. He was, indeed, a very monster!

Thursday 29, sailing among innumerable islands of ice, they found the main body too solid for the ships to make the least impression upon it, and finding no opening, the Commodore resolved to send a party under the command of the first lieutenant to examine the land, which at a distance appeared like a plain, diversified with hills and mountains, and exhibited in their situation a tolerable landscape.

On trying the water, it was less salt than any sea water they had ever tasted; and they found likewise, that the ice was no other than a body of congealed fresh water, which they imagined had been frozen in the infancy of the earth.

4 N

Tuesday

Tuesday 30, the weather being clear, they ran close to the main body of the ice, and the sun continuing to shine, made them almost forget the climate they were sailing in, but it was not long before they had reason for severe recollection. In coasting along, they observed many openings, and were in hopes, from their distant appearance, that a passage might be made between them: but upon trial it was found, as the Dutch fisherman had foretold, that these appearances were deceitful. At one in the morning fine clear sun-shine, they founded in 16 fathom water, and found small stones at bottom. They were then about four miles from the N. E. part of the northernmost land; the easternmost land in sight, distant above five or six leagues.

Saturday 31, at midnight, the easternmost land in sight lay E. N. E. one half E. which they could not make out to be an island. They rather judged it to be a continent, but found it impossible to determine with certainty, as it lay beyond their reach. At nine in the morning the *Carcase* hoisted out her cutter, and filled her empty water-casks with water from the ice. On this ice lie great quantities of snow, and as soon as a pit is dug, it fills with fine soft clear water, not inferior to that of many land springs. At noon they founded in 95 fathoms, the ground soft mud. This day a bear came over the ice to visit them, the first they had seen since they left Muffin's Island. They saluted him with a volley of small arms, and he returned the compliment, by turning his back upon them. Their longitude was this day 21 deg. 26 min. E. by time-keeper. Thermometer 45.

Sunday August 1, proved a day of trial. Lying among the close ice, with the loose ice driving fast to shore, the Commodore was desirous of surveying the westernmost of the seven islands, which appeared the highest, in order to judge, from the prospect on the hills, of the possibility of proceeding further on the discovery. With this view they carried out their ice-anchors, and made both ships fast to the main body, a practice very common with the fishing ships that annually frequent those seas. Of the reconnoitring party, were the Captains, the second lieutenants, one of the mathematicians, the pilots, and some chosen sailors, selected from both ships. They set out about two in the morning, and sometimes sailing, sometimes drawing their boats over the ice, they with difficulty reached the shore, where the first objects they saw were a herd of deer, so very tame, that they seemed as curious to gaze at the strangers, as the strangers were pleased to see them; for they came five or six together so near, that they might have been killed with the thrust of a bayonet; a proof that animals are not naturally afraid of man, till, by the fate of their associates, they are taught the danger of approaching them; a proof too, that animals are not destitute of reflection, otherwise how should they conclude, that what has befallen their fellow animals, will certainly happen to them, if they run the like risque. The gentlemen, however, suffered only one of these fearless innocents to be fired at, and that was done by a sailor when they were absent on observation.

On this island they gathered some scurvy-grafs, and in many places they could perceive the sides of the hills covered with the verdure on which these deer undoubtedly fed.

After having ascended the highest hills on the sea-coast, and taken a view of the country and the ocean all round, the gentlemen descended, and about five in the afternoon embarked again on their return to the ships, at which they arrived safe about ten, after an absence of 20 hours. They were greatly disappointed by the haziness of the weather on the tops of the mountains, which confined the prospect, and prevented their taking an observation with the instruments they had carried with them for that purpose.

There is here a small variation in the journals of the two ships; that kept on board the Commodore making the distance between the island and the ships near 20

miles; the other only five leagues, which might easily happen, as the ships shifted their stations with the main body of ice, sometimes driving N. W. sometimes the contrary course, as the wind and tides happened to fit.

Their situation now began to be serious, and it was discovered too late, that by grappling to the ice, as practised by the Greenlanders, they had endangered the loss of the ships, the loose ice closing so fast about them that they found it absolutely impossible to get them disengaged; and there was, besides, great reason to fear, that one or both would soon be crushed to pieces. Great minds are ever most distinguished by their expedients on the most alarming occasions. The Commodore set all hands to work to form a dock in the solid ice, large enough to moor both ships; and by the alacrity with which that service was performed, the ships were preserved from the danger of immediate destruction.

The ships being thus far secured, the officers, pilots, and masters, were all summoned on board the Commodore, to consult on what further was to be done in their present unpromising situation; when it was unanimously agreed, that their deliverance was hopeless; and that they must either provide to winter upon the adjacent islands, or attempt to launch their boats into the open sea, which was already at a considerable distance; for the loose ice had poured into the bay in which they were at anchor with so much rapidity, and in such astonishing quantities, that the open sea was already far out of sight. Before any thing farther was undertaken, the men were ordered to their quarters, that they might refresh themselves with sleep.

While their commanders preserve their fortitude, the sailors never lose their courage. They rose in the morning with as much alacrity and unconcern, as if they had been sailing with a fine breeze in the British Channel.

August 2, it was now thought advisable to make one desperate attempt to extricate the ships, by cutting a channel to the westward into the open sea. The scooping out the dock with so much expedition, by a party only of one ship, raised high expectations of what might be performed by the united labours of both the crews. No body of men ever undertook a work of such difficulty with so much cheerfulness and confidence of success, as the sailors observed on this occasion. Their ice-saws, axes, sledges, poles, and the whole group of sea-tools, were in an instant all employed in facilitating the work; but after cutting through blocks of solid ice from 8 to 15 feet deep, and coming to others of many fathoms, that exceeded the powers of man to separate, that was laid aside as a hopeless project; and another more promising, though not less laborious, adopted in its room.

On the 3rd of August, after the men had again refreshed themselves with sleep, it was resolved to fit up the boats belonging to both the ships with such coverings as were most easy to be accommodated, and of lightest conveyance; and by skating them over the ice, endeavour to launch them in the open sea. Could this be effected, they hoped, that by sailing and rowing to the northernmost harbour of Spitzbergen, they might arrive at that island, before the departure of the last ships belonging to the fishery for Europe.

While the boats were getting ready for this expedition, a second party were dispatched to the island, with orders to take the distance as exact as it was possible to the nearest open sea. As all the people belonging to the ships were not to be engaged in these services, those who were unemployed diverted themselves in hunting and killing the bears, that now, attracted perhaps by the savory smell of the provisions dressed on board the ships, came every day over the ice to repeat their visits. Several of these were killed occasionally, and this day they fought a sea-horse, in which engagement the second lieutenant of the *Carcase* signalized his courage in a most desperate encounter, in which, however, he succeeded, though his life was in imminent danger.

View of the RACE HORSE } CARCASS (under the command of L^d MULGRAVE } Capt^d Lutwyche) Inclosed in the ICE, in Lat . 80° 37' N. when preventing their Celebrated Expedition to the NORTH POLE.

On the 4th the carpenters, &c. were still employed in fitting up the boats. The pilots, who the day before had been sent to make observations on the islands already mentioned, made their report, that the nearest water they had seen was about 10 leagues to the westward; that in their passage they had met with great numbers of spars or pine trees, floating about the island, some of them of considerable size, with the bark rotted off, and the bodies much worm-eaten; that there was neither tree nor shrub to be seen growing on any of the seven islands, nor upon any land that they had yet discovered in that latitude, nor for 10 deg. farther S. and that the trees they had seen must therefore have come from a great distance.

Though there is nothing new in this observation, the like being annually observed by all the navigators who frequent those seas in the summer, and who collect their wood from those drifts, yet the country from whence they proceed has hitherto been thought a mystery. But it being now certain, that many of the great rivers that flow through the northernmost parts of Russia, empty themselves into this sea; and that there is an open communication throughout the different parts of it at different seasons of the year, there seems very little reason to doubt, but that those trees are torn up by land floods, and are precipitated into the sea by the rapidity of the streams.

It has indeed been objected, that all the wood that is found floating in this manner about the islands in high latitudes, is to a piece barked and worm-eaten; and that if these trees were torn up and precipitated into the sea in the manner above supposed, some of it would appear found and unbarked, as in its first state. To this it may be answered, that were the course of the tides to run as constantly to the northward, as the course of the rivers runs into the sea, this objection would be unanswerable. But the very reverse is known to be the fact; and that neither the winds nor the tides tend to the northwards for any considerable part of the year; so that from the time these trees enter the ocean, it must, in the ordinary course of things, be many ages before they can reach the latitudes in which they are now found. Because, if they are driven northwards by the strength of a storm from the south, they will be driven in another direction by the next storm that happens from another quarter; and all the while the calm continues, they will be driven to and fro by the tides, which, as has been observed, seldom set long to the north, therefore, being in continual motion for ages, or being cast upon the shore by tempests, or high tides, and lying there exposed to the air, till tempests or high tides return them again to the ocean, they will, in a long progression of time, be reduced to the state in which they are constantly found. This solution is, however, offered with diffidence. The fact is certain, of much wood being annually found about the islands in question; and it is now of little importance from whence it proceeds, as a passage by the north-east to China will probably never more be sought.

On the 5th they had gentle breezes; but about four in the morning small fleet. The ice still surrounding them, and appearing to grow more and more solid and fixed, those who had till now retained hopes that the south-east wind would again disunite its substance, and open a passage for their deliverance, began to despair, as the wind had blown for twenty-four hours from that quarter, from which alone they could have relief, and not the least alteration to be perceived. The men, however, were as joyous as ever, and shewed not the least concern about the danger of their situation.

Early in the morning, the man at the mast head of the *Caracae* gave notice, that three bears were making their way very fast over the ice, and that they were directing their course towards the ship. They had, without question, been invited by the scent of the blubber of the sea-horse killed a few days before, which the men had set on fire, and which was burning on the ice at the time of their approach. They proved to be a she bear and her two cubs; but the cubs were

nearly as large as the dam. They ran eagerly to the fire, and drew out from the flames part of the flesh of the sea-horse that remained unconsumed, and eat it voraciously. The crew from the ship, by way of diversion, threw great lumps of the flesh of the sea-horse which they had still left, out upon the ice, which the old bear fetched away singly, laid each lump before her cubs as she brought it, and dividing it, gave each a share, reserving but a small portion to herself. As she was fetching away the last piece they had to bestow, they levelled their muskets at the cubs, and shot them both dead; and in her retreat, they also wounded the dam, but not mortally. It would have drawn tears of pity from any but unfeeling minds, to have marked the affectionate concern expressed by this poor beast, in the dying moments of her expiring young. Though she was sorely wounded, and could but just crawl to the place where they lay, she carried the lump of flesh she had fetched away, as she had done the others before, tore it in pieces, and laid it down before them, and when she saw that they refused to eat, she laid her paws first upon one, and then upon the other, and endeavoured to raise them up. All this while it was pitiful to hear her moan. When she found she could not stir them, she went off, and when she had got at some distance, looked back and moaned; and that not availing her to entice them away, she returned, and smelling round them, began to lick their wounds. She went off a second time, as before, and having crawled a few paces, looked again behind her, and for some time stood moaning. But still her cubs not rising to follow her, she returned to them again, and with signs of inexpressible fondness, went round one and round the other, pawing them, and moaning. Finding at last that they were cold and lifeless, she raised her head towards the ship, and, like Caliban in the *Tempest*, growled a curse upon the murderers, which they returned with a volley of musket-balls. She fell between her cubs, and died licking their wounds. If what is related by a voyager of credit in the last century be true, the filial fondness of these animals is no less remarkable than the maternal. The young ones, says he, keep constantly close to the old ones. We observed that two young ones and an old one would not leave one another, for if one ran away, it turned back again immediately, as soon as it did hear the others in danger, as if it would come to help them. The old one ran to the young one, and the young one to the old one; and rather than they would leave one another, they would suffer themselves to be all killed.

Friday the 6th, the weather calm, but foggy, and the winds variable; they discovered that the drift of the ship, with the whole body of ice, inclined fast to the eastward; and that they were already embayed in the very middle of the seven islands. They therefore sent off the pilots of both ships, with a party of sailors, to the northernmost island, to see what discoveries could be made from the promontories there. They returned at night, after a fatiguing journey, with a dismal account, that nothing was to be seen from thence but a vast continent of ice, of which there was no end; and that the thought of wintering in such a situation was more dreadful, than that of perishing by instant death.

Saturday 7, the wind set in N. N. E. veered to the N. to the N. E. and E. piercing cold. This day the boats were all brought in readiness on the ice, fitted with weather cloaths about 13 inches above the gunnels, in order to keep off the cold as much as possible, if by good fortune they should be enabled to launch them in an open sea. This day was employed chiefly in boiling provisions to put in the boats for the intended voyage; in delivering out bags to the men to carry their bread, and in packing up such necessaries as every one could take along with him; for now every man was to be his own porter, the necessary provisions and liquors being found load enough for the boats, and twenty-five days bread load enough for each man. This being adjusted, when night approached they were all ordered on board to sleep.

Thursday

Thursday 8, at six in the morning all hands were ordered to turn out, and a detachment of fifty men from each ship, headed by their respective officers, were appointed to begin the hard task of hauling the launces along the ice. The bravest and gallantest actions performed in war, do not so strikingly mark the true character of a sea commander, as the readiness and alacrity with which his orders are obeyed in times of imminent danger. Every one now strove who should have the honour to be lifted in the band of haulers, of whom the Commodore took the direction, leaving Capt. Lutwych to take care of both the ships, that if any favourable turn should happen in the disposition of the ice, he might make use of the remaining part of both the crews to improve it. Upon a general consultation of officers, previous to this undertaking, it had been agreed, and an order issued accordingly, that no person on board, of whatever rank, should encumber himself with more cloaths than what he wore upon his back. Upon this occasion, therefore, the officers dressed themselves in flannels, and the common men put on the cloaths which the officers had thrown off. It was inconceivably laughable to see these motley bands yoked in their new harness; and, to say the truth, there was not one solemn face among the two companies. That headed by the Commodore drew stoutly for the honour of their leader, and that headed by their Lieutenants had their music to play to them, that they might dance it away, and keep pace with the Commander in chief. Indeed the officers who headed them were deservedly beloved as well as their commanders, particularly Lieutenant Beard, whose steady and uniform conduct in times of the greatest danger, cannot be sufficiently admired or applauded. Neither swayed by passion, nor disconcerted by the sudden embarrassments that often intervened, his conduct was always calm, and his orders resolute. He never was heard, during the whole voyage on the most pressing emergencies, to enforce his commands with an oath, or to call a sailor by any other than his usual name; and so sensible were they of his manly behaviour, that, when the ship was paid off at Deptford, they were only prevented by his most earnest request from stripping themselves to their shirts, to cover the streets with their cloaths, that he might not tread in the dirt in going to take coach.

In six hours, with the utmost efforts of human labour, they had only proceeded a single mile; and now it was time for them to dine, and recruit their almost exhausted spirits. As the Commodore had laboured with them, it was in character that he should dine with them also; and an accident happened that made it necessary for him so to do. The cook, with his mates, (who were bringing the Commodore and the officers their dinners under covers) to keep out the cold after coming from a warm fire-side, had made a little too free with the brandy bottle before they set out, and before they had got half way to the launces, the liquor began to operate; the cooks were sometimes very near boarding each other, sometimes they hauled off, and sometimes steered right a-head. At length coming to a chasm, or parting of the ice, which they were obliged to leap, down came the master cook, with dish, cover, meat and all; and what was still worse, though it was not then thought of much value, the Commodore's common service of plate, which the cook carried for the officers to dine on, fell in the chasm, and instantly sunk to the bottom. This accident brought the cook a little to himself, and he now stood pausing whether he should jump down the gulph after the plate, or proceed to the Commodore to beg mercy and make his apology. His mates persuaded him to the latter, as the Commodore was a kind-hearted gemman, and would never take a man's life away for a slip on the ice. Besides, it was a great jump for a fat man, and Commodore, they were sure, had rather lose all the plate in the great cabin, than lose cookie. Comforted a little by this speech, the cook proceeded, but let his mates go on first with what remained, to carry the tidings of what befell the rest. When the Commodore had heard the story, he judged how it was with them all. But

where is the cook, said he to the mates? He's crying behind, an please your honour. In the mean time the cook came up. Cook, said the Commodore, bring me your dinner. I will dine to-day with my comrades. My dinner! Ay, a pound of the flesh next my heart, if your honour likes it. The promptness of the reply shewed the sincerity of the cook's good-will, and pleased the Commodore better than a feast upon turtle. He dismissed him with a smile, and partook with the officers in what was left, who made up their dinners with a mess from the common men.

They had just begun to renew their labour, when word was brought, that the whole body of ice had changed its situation, and was moving to the westward; that the ships were both a-float; and that the ice was parting. The joy which this news diffused through the two companies of haulers is easier to conceive than express. They instantly shook off their harness, ran to assist in working the ships, and once more to resume their proper employments. When they arrived at the ships, Captain Lutwych, who was no less beloved by his men than the Commodore, had by his example and his judicious directions done wonders. Both ships were not only a-float, with their sails set, but actually cut and warped through the ice near half a mile. This ray of hope, however, was soon darkened; the body of ice suddenly assumed its former direction to the eastward, and closed upon them again as fast as ever. While the ships remained in the ice-dock, they were lashed together for their greater security, but now being launched and a-float, the ice pressed upon them with such weight, that it was every moment expected that the hawser would break that held them together; orders were therefore given, that the hawser should be slackened, and the ships released.

For the remainder of the evening, and till two in the morning, the drift continued eastward, and all that while the ships were in danger of being crushed by the closing of the channel in which they rode. They had now drifted two miles to the eastward; the men were worn out with fatigue in defending the ships with their ice-poles from being engulfed; and now nothing but scenes of horror and perdition appeared before their eyes. But the Omnipotent, in the very moment, when every hope of deliverance from their own united endeavour had relinquished them, interposed in their favour, and caused the winds to blow, and the ice to part in an astonishing manner, rending and cracking with a tremendous noise, surpassing that of the loudest thunder. At this very instant the whole continent of ice, which before was extended beyond the reach of sight from the highest mountains, moved together in various directions, splitting and dividing into vast bodies, and forming hills and plains of various figures and dimensions. All hearts were now again revived, and the prospect of being once more released from the frozen chains of the north inspired the men with fresh vigour. Every officer and every idler on board laboured now for life. The sails were all spread, that the ships might have the full advantage of the breeze to force them through the channels that were already opened, and to help them, like wedges, to rend the clefts that were but just cracking.

While the major part of the crews were employed in warping the ships with ice-anchors, axes, saws and poles, a party from both ships were dispatched to launch the boats. This was no easy task to accomplish. The ice, though split in many thousand pieces, was yet frozen like an island round the launces, and though it was of no great extent, yet the boats were of a weight hardly to be moved by the small force that could be spared to launch them. They were besides, by the driving of the ice, at more than five miles distance from the ships; and at this time no channels of communication were yet opened. But Providence was manifest even on this occasion; for the island on which the launces stood, parted while the men were hauling them, and by that lucky circumstance they were launched with great facility, without the loss of a man, though the ice cracked, as it were under their feet.

The

The people on board had not been able to force their way with the ships much more than a mile, when the party in the launches joined them. And now, excited by what curiosity or instinct is not easy to determine, several bears came posting over the ice to be spectators of their departure, and advanced so near the ships, that they might have been easily mastered, had not the men been more seriously employed.

This day they altered their soundings from thirty to fifty fathoms, and from fifty to eighty and eighty-five fathoms.

The breeze continuing fresh from E. S. E. and E. the ice seemed to open as fast as it had before closed when the wind blew westerly, and from the north; a strong presumptive proof of land to the eastward, which stopping the current of the loose ice in driving from the north and west, closes it in course, and renders it compact. On the contrary, when the wind blows off the land, and the current sets to the sea, the loose ice being no longer opposed, disperses itself again in the ocean, where it again floats, till the same cause produces the same effect. If therefore the land which our voyagers saw on the 30th, and which they could not determine with certainty to be an island, should, upon some future occasion, be discovered to be a continent, then the closing of the loose ice so suddenly about the seven islands, and its crowding one piece upon another to a great height, when violently agitated by tempests from the north or west, will be fully and naturally accounted for.

Tuesday the 10th, about two in the morning, the fog being thick, and the weather calm, and the men very much fatigued, they were ordered to their quarters, to refresh themselves with sleep. It was, besides, very cold, and much rain fell; and as the wind was variable, they could make but little progress. The ice, in the morning early, seemed rather to close upon them, than to divide; and being apprehensive for their boats, they attempted to hoist the launches on board, but that belonging to the *Careace*, being either too unwieldy, or the men too much fatigued to effect it, they slung her to the ship's side.

About eight the breeze sprung up fresh from the N. E. exceedingly cold, but opening the ice to the westward. They then made all the sail they could, driving with the loosening ice, and parting it wherever it was moveable with their whole force. Towards noon they lost sight of the Seven Islands. And in a very little while after, to their great joy, Spitzbergen was seen from the mast-head.

Wednesday 11, the men who, with hard labour, cold and watching, were much dispirited, on the prospect of a speedy deliverance, and seeing the ice no longer adhere in immovable bodies, began, after a little refreshment, to resume their wonted cheerfulness. They had not till the second closing of the ice, after the attempt to dig a passage through it had proved ineffectual, and that the hauling the launches had been tried with little better success, discovered the least despondency. But when they had exerted their utmost efforts, and Providence, which at first seemed to second their endeavours, appeared to have forsaken them; when their pilots had filled their minds with the terrors of their situation; and their officers had given the ships and their most valuable effects over for lost, the men then began to reflect on the hardships they were likely to suffer, and to be impressed with the sense of their common danger. Their apprehensions, however, were but temporary, and the moment they were released from their icy prison, and that they were within sight of a clear sea, their sorrow was changed to mirth, and their melancholy to rejoicing. Festivity and jollity took place of abstinence and gloomy apprehensions; and before they arrived at Spitzbergen, there was not a sailor on board with a serious face.

The ice that had parted from the main body, they had now time to admire. As it no longer obstructed their course, the various shapes in which the broken fragments appeared, were indeed very curious and

amusing. One remarkable piece described a magnificent arch so large and completely formed, that a sloop of considerable burden might have sailed through it without lowering her mast; another represented a church with windows and pillars, and domes; and a third, a table with icicles hanging round it like the fringes of a damask cloth. A fertile imagination might here find entertainment enough; for, as has already been observed, the similitude of all that art or nature has ever yet produced, might here be fancied.

They continued working all this day through the loose ice. Hacluit's Headland bearing south 39 west, and in their course saw a Dutch Greenlandman in the S. W. quarter.

Thursday the 12th, they cleared the ice, and bore away with all sails set for the harbour of Smearingburg, in which they had before cast anchor. At two in the afternoon they anchored in North Bay, the north part of Vogle Sound bearing north 45 east, distance about four miles. At half after four the Commodore made the signal to weigh; and at half past nine, came to an anchor in their former station, where they found four Dutch Greenlandmen lying in readiness to depart. These Dutchmen acquainted the Commodore, that all the English fishing ships set sail on the 10th of July, the day to which they are obliged by contract, to stay to entitle their owners to receive the bounty-money, allowed by Parliament for the encouragement of that fishery.

About the same time the greatest part of the Dutch set sail likewise from Spitzbergen, on their voyage home; but it is a practice with these last, to take it by turns to wait till the severity of the weather obliges them to leave the coast, in order to pick up such men as may by accident have lost their ships in the ice; and who, notwithstanding, may have had the good fortune to save their lives by means of their boats. This is a very humane institution, and does credit to the Dutch Government. Did the British Government bear an equal regard for individuals, so many valuable subjects would never be suffered to migrate, as now annually hire ships to convey themselves to seek their fortunes in new settlements. It is estimated, that twelve thousand at least are yearly shipped off from Ireland, and not many less from England and Scotland, yet no measures are thought necessary to be taken to retain them at home.

The turn of waiting at Spitzbergen falls annually to the lot of about five Dutch ships, who are obliged to send out their boats daily in search of their unfortunate fellow subjects; some of these boats have themselves suffered severely, and have been detained seven or eight days by severe weather in these excursions, to the great anxiety of their friends.

The day of our voyagers return to Smearingburg Harbour being fine, the Commodore ordered a tent to be raised on the lower point to the S. W. where there was a level plain for the space of two miles, and where all the mathematical apparatus were again taken on shore for a second trial.

They found, on the examination of the vibration of the pendulum, that it differed from that at Greenwich by Harrison's time keeper, only two seconds in forty-eight hours; which time-keeper, at their arrival at Greenwich, varied only one second and a half from the time-pieces at the observatory there. Mr. Robinson, who was articled to Commodore Phipps, from Christ's Hospital, and who does honour to that noble foundation, was particularly careful to note the result of all the observations that were made in this high latitude.

The ovens were also here taken on shore, and a considerable quantity of good soft bread baked for the refreshment of the men.

Hacluit's Headland, of which mention has been frequently made in the course of this voyage, is an island on the N. W. point of Spitzbergen, about 15 miles in circumference, on which is found plenty of scurvy-grass; and in the valleys, some of which extend from two to three miles, there is store of other

grafs in summer, on which the deer is supposed to feed.

The people were now fully employed in overhauling the rigging, tarring the ships sides, taking in water, peying and securing the masts, and in preparing the ships for pursuing their voyage upon discovery; or, if that was found impracticable, for returning home.

On the 16th, two of the Dutch ships weighed anchor, and sailed away in company.

On the 17th, vast pieces of broken ice, supposed to have fallen from the Icebergs, came floating into harbour. When these pieces, which are undermined by the continual agitation of the sea in stormy weather, lose their support, they tumble with a crack that surpasses the loudest thunder; but they were told, that no other thunder was ever heard in this latitude.

The activity and enterprising spirit of the Russians already noticed, begin to manifest itself every where, and it is not improbable, but that the maritime powers may one day or other have cause to repent their emulation in contributing to aggrandize the naval power of that increasing people. The dominions of the Russian empire, are situated to command the trade of the universe; they are now actually erecting a yard for building ships at Kampschatka, to improve their discoveries from that quarter, and to open a trade from thence to China. They have attempted to settle colonies, as our voyagers were told, on the southernmost districts of Spitzbergen, and those of the new settlers, who survived the first winter, were preparing to encounter the rigour of the climate in a second. This can only be done by way of experiment, to try if a settlement is practicable, for those now sent are said to be criminals.

During the six days which the ships anchored here to make observations, take in water, refresh the men, and refit, our journalist made several excursions to the adjoining islands, where the birds appeared in astonishing numbers; it being the season for bringing forth their young, and teaching them to fly, and to dive.

Of all the birds that breed in these islands, the burgermaster is the largest, and the most ravenous; he is so called by the Dutch, from his size and his authority, as he holds all the other birds in subjection. His bill is long and crooked, rather like that of the stork, than that of the hawk, and is of a yellow colour. He has a red ring about his eyes; is web-footed, but has but three claws on each foot. His wings are of a beautiful pearl colour, edged with white; his back a silver grey; his body white as snow, and his tail of the same colour, which when he flies he spreads like a fan. He builds his nest very high in the rocks, inaccessible either to bears or foxes. He preys upon all the other birds, and eats the carrion of fish or flesh, or whatever comes in his way. His cry is horrible, and when he screams, the mallemuch, a bird as large as a duck, is so much intimidated, that she will sink down, and suffer him to devour her without opposition.

Our journalist found it very dangerous to pursue his way over the hills and precipices in this rugged country. The clefts on the mountains are like those in the ice frequently impassable; but they are abundantly more hazardous, being sometimes concealed under the snow, so that a traveller is engulfed before he is aware. Many have been entombed in these clefts, and perished in the hearing of their companions, without a possibility of relief. To a contemplative mind, however, even the deformities of nature, are not unpleasing, the wisdom of the Creator being manifest in all his works.

On the 19th of August the ships unmoored, and on the 20th they cleared the harbour. They found the tide to flow N. E. and S. W. and to rise three feet seven inches perpendicular height.

On the 22nd, they again found themselves beset with loose ice. They were then in latitude 80 deg. 14 min. N. longitude 5 deg. 44 min. E.

On the 22nd, they had a heavy sea from the S. W. quarter.

On the 23rd, the Carcase, being a heavier sailer than

the Race Horse, lost sight of the Commodore, and fired a six pounder, which was answered. In the evening they came in sight, and pursued their course with favourable weather, and without any thing worthy of notice happening till

September 5, when, being clear and calm weather, the Commodore sounded, and found ground with 700 fathoms, very soft mud. The people were employed eight hours in heaving up the lead with the capstan. At three in the morning the sun risen, took the amplitude, and found the variation to be 22 deg. 53 min. W.

September 7, at five in the afternoon, they had heavy squalls, with rain; at seven in the morning moderate weather. This day, in 60 deg. 15 min. W. they found their longitude, corrected by observation of sun and moon, to be 5 deg. 59 min. E. Longitude by time-keeper 4 deg. 45 min. E. a very remarkable difference.

The ships pursued their course home in company together, with high seas and variable weather, till September 11, when, at half after ten, the night dark, and the weather moderate, the wind all at once veered to the southward, and a strong gale with a great sea came on. The ships parted, and never more came in sight till they met off Harwich, on the English coast.

Our journalist being on board the Carcase, can now only relate what happened to that sloop, till her arrival in the River Thames.

When the gale came on, the Commodore's lights not appearing, the Carcase fired a six-pounder, but that shot not being returned by the Race Horse, it was concluded, that the Commodore was at too great a distance to hear the signal. At four in the morning the gale increasing, they clove reefed the top-sails, and employed all hands in lashing and securing the boats and booms, and preparing to withstand the threatening storm. At this time they were in latitude 57 deg. 44 min. N. the Naze of Norway bearing S. 88 E. distant 31 leagues.

Sunday, September 12, fresh gales, with frequent showers of rain: handed gib and stay-sail; at two in the afternoon hard squalls and violent showers of rain; handed fore and mizen top-sail; saw a sail to southward standing to eastward; cloudy and obscure sky; at ten at night came on suddenly a very heavy squall; handed all the top-sails; strong gale, with severe showers of rain. At midnight blowing a violent storm of wind, reefed and handed the main-sail and fore-sail; lowered down the lower yards, balanced the mizen, and laid the ship to under it, with her head to the westward; the sea making a free passage over the ship. Shipped such heavy seas, washed all the provisions and casks that were lashed on the deck, over-board; kept two pumps continually going; obliged to skuttle the boats, to prevent their being washed over-board. At four in the morning shipped such heavy seas, as washed all the booms and spars that had been with all possible care secured on the deck, over-board. The ship mostly under water. No sight of the Commodore; under great apprehensions for his safety, as his vessel laboured much more than ours. At this time one of the mates, the carpenter, and a fore-mast-man, were washed over-board. The carpenter, a very careful sober man, who was in the waste, securing the hatches and stores, was washed in and out at the port three times, before he could secure himself. At ten in the morning rather moderate. Set the mizen-stay-sail; swayed the lower yards up, and set the courses. At half past eleven, strong squalls and heavy gulls; handed both courses; and settled the lower yards.

September 13, strong gales and squally. Continually shipping heavy seas. At three in the afternoon rather more moderate; set reef courses; swayed up the lower yards, and set the main-top-sail. The ship now making no water; at seven in the evening set fore-top sail and gib; very heavy sea from S. W. quarter. At eight in the evening moderate and cloudy; let the third reef out of the main-top-sail; sounded 35 fathoms fine

fine brown sand. At one in the morning light airs, hazy weather, and great sea. Wore ship, and stood to westward. At four fresh breezes, with rain. At half past eight saw a fail to eastward; supposing it the Commodore, made the private signal, and fired a fix-pounder. At nine bore down upon her, and brought her to. She proved a Hollander from Archangel, bound to Bremen. Course S. 42 W. latitude 56 deg. 4 min. N.

September 14, strong gales, and cloudy; under reef courses. At two in the afternoon moderate; set main-top-fail. At three set fore-top-fail; a great sea from westward. At seven in the evening moderate and cloudy. Out the third reef of the main-top fail; uncertain weather; squally, and at times much rain; at three great fog. This day at noon, Flamborough-head S. 46 W. distance 30 leagues.

September 15, light breezes, and clear weather; cut all reefs, and swayed up the lower yards. At four in the afternoon saw a fail to the S. E. bore down and brought her to. She proved to be a Prussian fisherman, had been 10 days from Edinburgh; hoisted out the small cutter; the second lieutenant went on board of her, and bought a fine cargo of fish. At five the boat returned; we hoisted her on board, with plenty of mackerel and herrings. Made fail, and stood to S. W. founded every half hour; found from 13 to 15 and 18 fathoms, fine brown sand, mixed with black shells. At seven in the evening took the first reef, and hauled in the top-fails; fresh gales and cloudy. At two in the morning deepened in water to 20 fathom. Took in second reef of the top-fails; tacked ship, and stood to N. W. At five in the morning got into 15 fathom; and at seven into 10. At nine in the morning close reefed the top fails, and at 10 handed them; very fresh gale, and violent rain.

September 16, rather more moderate; set the main-top-fail; squally, with rain; a confused sea from W. N. W. At five in the afternoon soundings from 5 to 12, from 27 to 32 and 34 fathoms, fine brown sand, black specks, fresh gales and cloudy. At eight took in first and second reefs of top-fails; at eleven at night close reefed the main and fore-top-fail, and handed the mizen; fresh gales, and cloudy weather. At four in the morning shoaled water to 22 fathoms; brown sand and broken shells. At five saw several fail to N. W. fired, and brought one of them to. At eight shook the first and second reefs out of the top-fail; hove down upon a sloop, which came from Gravesend; took on board the master, as a pilot to carry the ship through Yarmouth Roads; put on board one man in his room, and ordered his vessel to follow us. Stood to the southward.

September 17, fresh breezes, and cloudy weather; kept the lead going every half hour; found our sounding from 10 to 12 fathoms, fine brown sand. At six in the afternoon fresh gales; close reefed the main-top-fail; soundings from 10 to 16 fathom; broken shells and large stones. At seven close reefed the main-top-fail; kept a light in the poop-lantern for the sloop. At ten strong gales; handed the top-fails; laid her to under the main-fail; handed the fore-fail. At eleven at night got into five fathom; but deepened to eight, nine and ten fathom brown sand. Lost sight of the fishing vessel; fired several guns, and made a signal in the mizen-throw. On setting the fore-top-fail stacil, it blew to pieces; bent a new one. A violent gale of wind; shipped a great quantity of water. At four rather moderate; set the fore-fail. At midnight set close; reefed top-fails. At half past six tacked; at seven saw the fishing vessel; bore down and spoke with her, who had split her main-fail in the night. At ten saw the land bearing S. W. by W. and S. and by W. At eleven being clear and moderate weather, shook all the reefs out of the top-fails, and set the top-gallant-fails; saw Cromer light-house bearing S. 55 deg. W. distance five leagues.

September 19, fresh breezes and clear weather; bent the sheet-cable, and hauled a range of the best and

small bower-cables; bent both buoy ropes and buoys to the anchor. At five light breezes and fair; tacked and stood to the southward. At six tacked and stood to the north-west. Cramer N. W. and by N. four miles; light breezes, and pleasant weather; handed in top-gallant-fails, and handed the main-fail. At seven in the evening, to our great joy, saw Yarmouth Church, bearing S. W. At ten at night came to anchor with the best bower in twelve fathom, fine sand and clay; veered out to half a cable, and handed all the fails. Winterstone Nefs lights bore S. and by W. four miles. At two in the morning fresh breezes and cloudy. At half past four weighed, and made fail. Employed in working from Winterstone Nefs lights, to Yarmouth Roads, making several tacks. At seven in the morning set top-gallant-fails; at nine came to an anchor in Yarmouth Road, with best bower in seven fathoms water; sand and clay. Yarmouth church south fifteen west, distance two miles. Came on board a pilot to carry the ship to the Nore.

September 20, fresh breezes and clear weather; sent down top-gallant-yards, and got every thing clear for striking tokens. At five in the afternoon moored the ship. Yarmouth church W. S. W. two miles.

September 21, fresh gales and cloudy, with frequent rain. At four in the afternoon sent down top-gallant-mast. At eight in the morning sent the long-boat on shore for water. We were this day visited by several of the inhabitants of Norwich and Yarmouth, who were genteelly entertained by the officers, but we could get no intelligence of the Commodore.

September 23, dark cloudy weather. At six in the evening swayed up the top-mast, and lower yards; the wind veered to N. W. we prepared to unmoor. Fresh gales, with frequent flashes of lightning. At seven in the morning set on top-gallant-mast, and began to unmoor. At eight veered away upon the best bower, and took up the small bower-anchor. At nine weighed and made fail. At ten got up the top-gallant-yards, in company with several ships.

Saturday 25, at five came to an anchor in eleven fathoms. Orford light-house E. by S. four miles. This day some religious books were distributed among the sailors, which had been sent on board by some pious person for their particular perusal.

Sunday 26. At six in the evening came to with the best bower in seven fathoms water; Balfey church W. by S. At two in the morning weighed, and came to fail; Harwich lights N. W. by W. To their great surprise, saw the Race Horse at anchor. Hoisted out the cutter, and Captain Lutwych waited on the Commodore, from whom he learnt, that in the storm of the twelfth they had all their boats washed over-board; and, to ease the ship were obliged to heave all their guns over-board, except two. Came to anchor; Harwich church N. W.

Monday 27, at two in the afternoon weighed, and came to fail in company with the Race Horse. At eight in the evening came to in the Swin. At five in the morning weighed, in company as before. Turning up the Swin at half past nine, came to; Whitaker Beacon N. N. E. one mile.

Tuesday 28, fresh breezes and cloudy weather. At half past three weighed, and came to fail. At half past six came to with the best bower in six fathom water; Shoe Beacon N. W. At half past five weighed, and came to fail. Working to windward at eleven in the forenoon, the Commodore's boat came on board, with orders to proceed to Deptford. At noon came to at the Nore with the best bower.

Wednesday 29, light breezes and fair weather. At half past five weighed, and made fail. Employed in working up the river. At half past ten came to with the best bower in the gallions, in three fathoms water. Woolwich church N. by S. one half E. At noon a hoy came along-side for the gunner's stores.

Thursday 30, employed most of the afternoon in getting out the guns, and gunner's stores. At nine in the evening weighed, and came to fail. At ten run foul

foul of a large transport, and carried away the lar-board mizen-threads, and part of the channel. At one in the morning came to anchor at Deptford. Warped alongside the Bedford Hulk, and moored. At six unbent the sails, and began to unrig.

Thus ended a voyage, which seems to have determined the question so much agitated concerning the navigation to the north pole, and proved what Captain Wood had before asserted, that no passage would ever be found practicable in that direction.

From the quantities of ice which that navigator met with in latitude 76 degrees north, he concluded indeed erroneously, that the 80th degree, would bound the passage towards the poles, and that from thence the polar region was either a continued continent of solid ice, or that land filled up the intermediate space.

It has been found, however, that those seas are navigable as far as 81 and 82 deg. of latitude; and it may possibly happen, that in some future years, they may be found navigable a degree or two farther: but it may now with certainty be concluded, that a course under the pole can never be pursued for the purpose of commerce.

We have already shewn incontestibly, that the north sea communicates with the eastern sea, and that the passage to China and Japan may be performed with difficulty by a N. E. course, by watching the opportunity, when a few days in the year the north sea is open. But who would think of exposing a ship's company to the hazard of being frozen to death in a tedious, uncertain, and dangerous passage, when a safe, certain, and, one may say, speedy passage at all times lies open before them.

From Behring's discoveries to the east of Japan, and from the continent he there met with, there seems reason to believe, that the land seen by Commodore Phipps to the eastward of the Seven Islands, might be a continuation of that continent. In that case it is not improbable, but that either that continent may join to the western part of America, or that it may extend southward, and form a part of that continent so much sought after in the southern hemisphere.

A small premium of two or three thousand pounds secured by Parliament, to be paid to the owner or owners of any Greenland fishing ship, that should be fortunate enough to discover such a continent to the eastward or northward of the Seven Islands, might possibly have a better effect, than many expensive expeditions fitted out solely for the purposes of such discovery. This, by a trading nation, were it only to improve the science of geography, would surely be well bestowed.

It is true, indeed, that the reward secured by parliament for the discovery of a north-west passage, has not yet been attended with that success, with which the promoters of the bill had flattered themselves and the public, from the liberal spirit with which it was granted.

The Hudson's Bay Company, though bound by their charter to further and promote the discovery, were generally suspected from interested motives, to oppose and discourage every attempt to accomplish it. And Captain Middleton, who in 1740 was sent in a king's ship upon that service, returning without success, was publicly charged with having received a bribe of five thousand pounds to defeat the undertaking, and by his report to discourage any farther attempts in pursuit of it. This charge was strongly supported, and generally credited. And Mr. Dobbs, by whose interest Captain Middleton was employed, had the address to prevail with the then ministry, to preclude any future scheme of private corruption, by promoting the public reward already mentioned.

The preamble to the act will state this matter in the true light it sets forth, "That whereas the discovery of a north-west passage through Hudson's Streight to the western ocean would be of great benefit and advantage to this kingdom, and that it would be of great advantage

to the adventurers to attempt the same, if a public reward was given to such persons as should make a perfect discovery of the said passage; it is therefore enacted, that if any ships or vessels belonging to his Majesty's subjects shall find out and sail through any passage by sea between Hudson's bay and the western ocean of America, the owners of such ships or vessels shall be entitled to receive as a reward for such discovery the sum of Twenty-thousand Pounds." And as a farther encouragement to prosecute this discovery, and to prevent obstructions from interested persons, it was enacted, "that all persons, subjects of his Majesty, residing in any place where the said adventurers may come in the prosecution of this discovery, shall give the said adventurers all assistance, and shall no way obstruct, molest, or refuse the said adventurers reasonable succour in any distress they may fall into in the prosecution of this discovery."

Such was the encouragement, and such the liberal reward that was and is secured by parliament to the fortunate discoverers of a north-west passage to the great pacific ocean; a passage which, it is generally believed, would open a trade with nations on the northern continent of America, wholly unknown to the maritime powers of Europe, and supposed, from their situation, to abound in commodities equally rare and precious with those of any other country under the sun.

The fair prospect of acquiring fame by enlarging commerce, the hope of obtaining the parliamentary reward, and the desire of exposing the dissimulosity of Captain Middleton, were incitements sufficient to prevail with Mr. Dobbs to solicit the equipment of two ships for another voyage, which he made not the least doubt would find out the passage so long sought for in vain, and by the advantages attending the discovery, exceed the most sanguine expectations of the adventurers.

The command of this expedition was given to Captain Ellis, who, on the 31st of May, 1746, passed Yarmouth in the Dobb's Galley, accompanied by the California Sloop, and conveyed to the north sea by the Loo man of war. But in proportion as Mr. Dobbs had flattered the avarice of the adventurers who were to share in the reward, and had elated himself with the thoughts of triumphing over the disgrace of Captain Middleton, so it happened, that when the ships returned without having effected any one thing of consequence, the chagrin of the former for having advanced their money on a visionary project, and the mortification of the latter in not being able to support his charge, were increased by every circumstance that could aggravate the disappointment. Captain Middleton now triumphed in his turn, and no ship from England has since been induced to undertake the voyage, notwithstanding the greatness of the reward.

It is now, however, believed, that government have in contemplation another voyage to the north, to which that of Captain Phipps was only the prelude; but there is reason to conclude, from what has already been said of these latter attempts, and from the ill success of former undertakings, that the discovery of a north-west passage is not the sole object in view. The figure of the earth, the phenomena of the winds, the variation of the compass, and the attraction of the magnet, are points yet unsettled, of infinite importance to navigation; and it is not impossible, but that a more careful examination of the polar regions may lead to the solution of problems, that have hitherto baffled the enquiries of the ablest navigators.

A very slender acquaintance with the difficulties and hardships attending northern discoveries, will fully account for our knowledge of the countries surrounding the pole being still very imperfect. A brief recapitulation of the sufferings of those to whom we are most indebted for our information, will not, we hope, be thought an improper conclusion to a voyage solely undertaken with a view to enlarge it.

The first who conceived the idea of exploring the northern regions was Sebastian Cabbot. That enterprising

prizing navigator, long before Magellan thought of a passage to the pacific ocean by the south-west, had made two voyages, with a view to direct his course to the same sea by the north-west. In these voyages, he discovered Newfoundland, the coast of the Esquimaux Indians, and had penetrated as far as the 64th degree of latitude, when a mutiny among his men, or rather an obstinate refusal to proceed any further, obliged him to return; yet he died in the persuasion that a passage in that direction certainly existed, and that he should have found it but for the opposition of his crew.

The next, who prepossessed with the same notion, undertook a voyage for discoveries towards the north, was Sir Martin Forbisher. He discovered Greenland, and in the latitude of 62 deg. north, passed a strait, which, though it still holds a place in our maps, has never been found navigable since. He made two other voyages, discovered many bays and capes, to which he gave names, but returned without attaining the principal object of his voyage, though like his predecessor, he asserted the certainty of its existence to his latest hour.

To him succeeded Sir Humphry Gilbert, who in 1583 traversed the coast of Labradore, entered the mouth of the great river St. Laurence, and, surrounding the island of Newfoundland, laid the foundation of the cod fishery, which has been prosecuted with immense advantage to his country ever since.

The rapid progress of discoveries in the southern hemisphere, which about this time were attended with vast profit to the adventurers, re-animated cotemporary navigators to prosecute, with more ardour than ever, their enterprizes towards the north. The more the pacific ocean became known, the firmer the belief prevailed, that a passage into it by way of the north must certainly exist, and that whoever could discover it, would not only immortalize his name, but enrich his country.

The merchants of that time were no less eager to embark their money, than the navigators were to hazard their persons in any new project, where the hope of gain appeared to be well founded. A company therefore of wealthy persons in London agreed to join a company of merchants in the west, and to fit out two ships for the discovery of a passage, which all agreed was practicable, though none could tell readily where to find it. To the command of this expedition Captain John Davis was strongly recommended as an able navigator, and of a bold and enterprising spirit. Accordingly, on the 7th of June, 1685, he set sail from Dartmouth, in the Sun-shine of fifty tons, and accompanied by the Moon-shine of thirty-five tons, having on board both vessels forty-two hardy seamen. On the 19th of July they were alarmed by a mighty roaring, which was the more terrible, as the fog was so thick, that they could not see each other at a ship's length. It proved only the crackling of the islands of ice, which was not then very well understood. On the breaking up of the fog they discovered land, which, from its horrid appearance, they named the Land of Desolation. On the 24th they were in 64 deg. 15 min. north, the sea open and the weather moderate. In this latitude they discovered land, and conversed with the natives, who appeared to be a harmless hospitable people, polite in their manners, neatly habited, and not ill-favoured. These friendly people, observing that the English admired their furs, went up in the country to bring down more, with which they traded with much simplicity. To an adjoining hill Davis gave the name of Mount Raleigh, from which he took his departure on the 8th of August, and on the 11th doubled the southernmost cape in view, to which he gave the name of the Cape of God's Mercy, and entered a strait, which bears the name of the discoverer to this day. In this strait he sailed sixty leagues, and on the 14th went on shore, and found evident signs of human inhabitants, being met by a pack of dogs (twenty in number) that expressed their joy, as if their masters had been returned after an interval of absence. One of those had on a leathern collar. The Captain

No. 40.

was highly pleased with the promising appearance of the new straits, and consulting with the master, agreed to report, upon their return home, that they had found the wished-for passage to the western sea.

The weather changing from temperate to excessive cold, on the 20th it was resolved to set sail for England. On the 12th of September they fell in with the land of Desolation, and on the 30th of the same month entered the port of Dartmouth without the loss of a man.

The account Captain Davis gave to his owners was so well received, that other merchants were desirous of joining in a second expedition, and accordingly he was again employed, and furnished with a much greater force.

On the 7th of May he sailed from Dartmouth in the Mermaid, of 120 tons, in company with the Sun-shine and Moon-shine as before, and an additional pinnace of thirteen tons, called the North Star.

In the latitude of 60 degrees north Captain Davis divided his force, ordering the Sun-shine and North Star to seek a passage between Greenland and Iceland, while the Mermaid and Moon-shine continued their course to the strait as before. In the latitude of 64 degrees, and longitude 58 deg. 30 min. north from London, they fell again in with the land, and met the same people with whom they had traded the former year. Overjoyed to meet, they renewed their acquaintance, and while the English was preparing a pinnace to facilitate their discoveries, the natives came in numbers to carry on trade. As soon as the pinnace was fitted for sea, Captain Davis dispatched her to examine the inlets on the coast, and to trace their course up the main land; but that was productive of no essential discovery.

Though the natives attended them with an obsequious diligence, yet on their kindling a fire in their manner, and using some strange ceremonies, Captain Davis supposing them to be using idolatrous sorceries, first thrust the priest into the smoke, and then encouraged his men to tread out the flame, and to spurn the reeking coals into the sea. Unable to bear the insult, the natives for the first time began to shew resentment. They seized the boat from the stern of the Moon-shine, cut the cable belonging to the Mermaid, made prize of the implements that lay upon the shore, and, in short, declared open hostilities against the aggressors, who in return discharged their artillery among them, which instantly dispersed them.

No civilities, however, that could be shewn them, after the indignity offered to their priest, could ever after reconcile them, and the year following they found an opportunity to take a severe revenge. In the mean time one of them being made prisoner, was taken on board the Mermaid; who, after recovering his fright, trimmed up his darts, repaired his fishing tackle, picked oakum, and set his hand to any thing he was set about; and, after a time, became a very pleasant companion on board.

On the 17th of July, in latitude 63 degrees 8 min. north, they fell in with a continent of ice, very high, like land, with bays and caps, and, till they examined it closely, could not be convinced that it was a mere congelation. They coasted it till the 30th, when the weather became so tempestuous and foggy, and withal so cold, that the shrouds, ropes, and sails were frozen and glazed with ice; and the men, who the year before found the sea open and the weather temperate, became so dispirited, that in an orderly manner they addressed their Commander, and intreated him to consider their present situation, to have regard to his own life, and the preservation of theirs; and not through boldness and an indiscreet zeal for a hopeless discovery, leave their widows and fatherless children to blacken his memory with bitter curses. Moved with their pitiable representation, he discharged the Mermaid with those who were most desirous of returning home, and proceeded in the Moonshine to prosecute his voyage. Changing his course to recover the opposite shore on

the 1st of August, in latitude 66 deg. 33 min. N. and longitude 70 deg. W. he discovered land, without either ice or snow. On the 2nd, they cast anchor in a fine road, and in a day or two were visited by the natives, who came to traffic. On the 14th, they set sail to the westward, and on the 16th, changed their course to the southward. On the 18th, they discovered a high promontory to the N. W. which having no land to the south, recovered their hopes of a free passage.

On doubling the Cape, they found the land trending away to the south in broken islands, and coasting along till they arrived at a fine opening, in latitude 57 deg. they sailed 10 leagues, with woods and lawns on each side, abounding with deer and game of every kind. Here they staid till the 1st of September, and then set sail, coasting along to the northward, where they were again flattered with the hopes of a passage, by observing a strong current rushing in between two lands to the westward, which they were very desirous of approaching, but the wind blew directly against them.

On the 6th, returning to their former station, five of the crew fell into an ambush; for having ventured on shore unarmed in their boat, they were suddenly assaulted from the woods, two of them killed upon the spot, two grievously wounded, and the fifth made his escape by swimming, with an arrow sticking in his arm. The same evening a furious storm arose, which lasted till the 10th, in which time they in a manner unrigged their ship, and were about to cut away her masts by the board, the cable of their sheet anchor parted, and they every moment expected to be dashed upon the rocks, and to be made a prey by the savage cannibals of the country; but the storm abating, and the sea growing calm, they recovered their anchor on the 11th, and made sail for England.

About the beginning of October they arrived at Dartmouth, where they found the *Sunshine*, but the *North Star* having parted company in a hard gale on the coast of Greenland, was never more heard of.

This undaunted mariner had yet the courage to undertake a third voyage, and then sailed as far as the 73rd degree of north latitude, but being deserted by his companions, was forced to return in great distress to his old port. Upon his return he wrote a letter to his patron, assuring him, that he had found an open sea in latitude 73 deg. N. and a strait 40 leagues broad, and concluded from thence that the passage was most certain.

From this period till the year 1610, we find no farther attempts made to revive this discovery; but in that year Mr. Henry Hudson, one of the most celebrated mariners of his time, was prevailed upon to undertake a voyage that was purposely set on foot to make trial of his skill. He sailed April the 7th, 1610, steering directly to Davis's Straits, he there changed his course to the westward, and struck out a new track that no mariner had ever sailed before, which led him through the strait that still bears his name into the great bay that bounds the American continent on the N. E. and seems to communicate by various openings with the north sea. Here he continued traversing for almost three months in search of a passage to the westward, but finding himself embayed, he stood to the south, intending to winter in the mildest latitude the bay would admit; accordingly, he is said to have wintered in latitude 52 deg. N. longitude 80 deg. W. where on the 1st of November his ship was frozen in, and being scantily provided with provisions, the crew mutinied, and in the end most barbarously contrived, as the writer expresses it, to turn the Captain, the carpenter, and all the sick men out of the ship, who were never more heard of. After which the leaders of the mutiny determined to make the best of their way for England; but in their passage home not a few perished, and those who survived suffered unspeakable misery.

But notwithstanding this disaster, and that it was

certainly known that the Captain and all who were left behind were either drowned, starved, or murdered, the progress he had made in the discovery encouraged others to follow his track.

The next who adventured was Captain Button, a man of great abilities, courage, and experience. Patronized by Henry, Prince of Wales, he sailed in 1611, and having passed Hudson's Straits, pursued a different track from that of Captain Hudson, leaving his discoveries to the south, and shaping his course to the N. W.

After sailing more than 200 leagues, he fell in with a large continent, which, from its mountainous appearance, he named New Wales; but finding no passage to the westward, he followed the direction of the land to the southward, till he arrived at Port Nelson, where he wintered in 63 deg. 30 min. N. but, though he kept three fires in his ship constantly burning, and his company killed incredible numbers of white partridges and other wild fowl, yet many of his men perished by the severity of the cold, which in that climate was almost insupportable.

In 1615, Captain William Baffin undertook the examination of the extremity of that sea into which Davis's Straits opened a passage, and he so far succeeded, as to determine its extent, and to discover an outlet marked in our maps, by the name of Sir Thomas Smith's Sound, which is probably the only communication between our northern bays and the great pacific ocean, which nature has provided, in order to maintain a general circulation, without which it is hardly possible to conceive, that the equipoise of the globe could for a moment be preserved.

In 1619 Captain John Monk, at the instance of his Danish Majesty, undertook this discovery, and arrived safe at Cape Farewell, where though the tackle of the ship was so frozen and full of icicles, that the mariners could not handle the ropes, yet next day it was so hot, that they were forced to work in their shirts. He entered Hudson's Strait in the month of July, and was forced to winter in latitude 63 deg. 20 min. N. on an island that still retains his name; but the hardships he endured almost exceeded belief. In May 1620, he found himself alone in a cave dug in the earth, scarce alive, and almost morally certain, that all his mariners were dead. As soon as the weather would permit he crawled forth, and found, of all his crew, only two left. By removing the snow, they found some fresh herbs underneath, and by eating them, recovered from the scurvy. Unable to navigate their ships, they abandoned her to the savages, and, by a wonderful Providence, got safe to Norway in the pinnace. Being a man of uncommon resolution, he was still solicitous to perfect a discovery, which had baffled the researches of so many able navigators, and to acquire glory, by accomplishing that which they had failed to attain. He asserted the existence of such a passage so confidently, and laid down the method of finding it so plausibly, that he had persuaded the merchants of Norway to raise a joint stock to defray the expences of a second voyage; but applying to the King for his permission and protection, and relating to him his own sufferings, and those of his companions in his former voyage, his Majesty told him, he had already been the death of too many of his subjects, and wondered at his presumption to seek to murder more. To which Monk gave a quick reply, which provoked the king to strike him over his stomach with his cane. Whether the severity of the blow, or the sense of the indignity was the occasion, is not certain; but he quitted the royal presence with marks of strong resentment, and returning to his chamber, refused assistance, and three days after breathed his last.

Captain Luke Fox and Captain James were the next who professedly engaged in this discovery; the first in a king's frigate, victualled for 18 months; the other in a small vessel of 70 tons, built at Bristol on purpose; victualled and equipped by private adventurers.

Captain

Captain Fox departed in the spring of 1631, traced all the western bays discovered by former navigators, examined the westernmost part of Hudson's Bay, and returned in 1632. He published a pompous account of his discoveries, which, however, was never much regarded.

On the 3rd of May, 1631, Captain James set sail from the Severn's Mouth, and on the 29th of June cleared Hudson's Straits, where he found himself so pestered with broken ice, as to put it out of his power to prosecute his discoveries to the north westward, as he had intended; he therefore ordered his master to steer W. S. W. and on the 27th of July, after sustaining most dreadful shocks, found his ship enclosed so fast among the ice, that, notwithstanding it blew a hard gale, and all sails set, she stirred no more than if she had been in a dry dock. It was now that the men first began to murmur, and the Captain himself was not without his fears, lest they should here be frozen up and obliged to winter in the middle of the sea. By an observation which they made upon the ice, they found that they were in latitude 58 deg. 54 min. N.

On the 3th of next month to their great joy the ice opened, and on the 6th, they were again in a clear sea. On the 13th, seeing some breakers a-head, and loosing to clear them, the ship suddenly struck upon the rocks, and received three dreadful shocks, but the swell heaved her over, and on pumping she made no water.

They were now encumbered with rocks, as before they had been with ice, and in the most perilous situation that can be conceived, and so continued two nights and two days, every moment expecting to be dashed to pieces. On the fog's clearing up they saw land from the N. W. to the S. E. by E. with rocks and breakers. On the 16th they weighed and made sail, when a storm arose and drove them within sight of Port Nelson. On the 17th they stood to the southward. On the 20th they made land, in latitude 57 deg. N. where they cast anchor, and called it the Principality of South Wales.

Having weighed, on the 27th they set sail, and in the evening came in sight of higher land; and on the 29th they saw a sail, which proved to be Captain Fox, already mentioned. They spoke together, and, after exchanging mutual civilities, parted.

Captain James kept coasting along the shore to make discoveries, and Captain Fox made the best of his way for England.

The Captain now began to think of a convenient place to winter in. In this attempt they met with so many disasters, that at last having no hope left, they began to prepare themselves to make a good end of a miserable life. On the 19th they lost their shallop, though lashed to the ship by two hawfers, and to their inexpressible grief their boat was almost rendered irreparable.

Winter now began to set in a-pace, the nights long,

the days close and foggy, the seas rough, and nothing but shoals and broken land to navigate. Added to all these the men began to sicken, an universal dejection to prevail, and in proportion as their distresses increased, their strength to bear up against them grew less every day.

On the 4th of November, being in latitude 52 deg. N. they fell in with an island, from which they found it impossible to depart. The men were quite worn down with fatigue, the sails so frozen as not to be unfurled, the ropes congealed in the blocks, and the deck knee-deep in snow. In this forlorn condition they built a tent on shore for the sick, and in this tent they kept fires continually burning night and day, but the cold increased so fast, that beer, and even spirits froze by the fire-side.

The sufferings of the Captain and crew from the latter end of October, when they landed till the 2nd of July, when they departed, are hardly to be parelleled.

This was the last voyage that was undertaken for the discovery of a north-west passage, till that of Captain Middleton. From all which, and the opinion of Captain James after his return, there is great reason to conclude, that what we have said of a north-east passage is likewise true of a passage by the north-west, that it most certainly exists, but will never be found practicable for mercantile purposes.

The voyage of Commodore Phipps, which his Majesty, in a particular manner, thought fit to patronize, was equipped with such care and circumspection, that nothing was found wanting during the course of it.

To this voyage, we have prefixed a brief recapitulation of the many attempts that have been made for the discovery of a north-east passage to China and Japan; and also have subjoined a like summary of the enterprises set on foot by government, or undertaken by private adventurers, for discovering a communication with the great Pacific ocean by a passage from the north-west.

The accounts are full of astonishing events, and wonderful descriptions of uncommon phenomena. In them we read of rivers and lakes of ice, burbling with imprisoned vapours; and of rocks, forests, beams of houses and buildings, splitting with a noise not less terrible than the loudest thunder. Of brandy, brine, and even spirits of wine, exposed to the open air, only for a few hours, freezing into a solid mass. Of mountains of ice frozen in the sea 100 fathom deep. Of snow hills that never thaw. And of winds that blister the flesh, and shrivel the skin like red-hot iron.

In this part of our work the distresses, dangers, providential deliverances, and unspeakable sufferings of those who have wintered in the dark and dreary regions of the north, are recounted with clearness; and the contents of many volumes are comprized with care and precision.

NEW, AUTHENTIC, and COMPLETE ACCOUNT and NARRATIVE of
A VOYAGE Round the WORLD,

UNDERTAKEN and PERFORMED

By Commodore (afterwards Lord) ANSON,

In his Majesty's Ship the CENTURION,

HAVING UNDER HIS COMMAND

The Gloucester, Pearl, Severn, Wager, Trial, and two Store Ships.

THE Spanish depredations in the year 1739, having roused the national resentment, and the pacific ministry who then were intrusted with the administration of affairs, finding it impossible any longer to prevent a war with Spain, several projects were proposed, and several plans formed, for distressing the enemy in the most effectual manner, by cutting off the resources by which alone they were encouraged to continue their insults, and by which alone they could be enabled to support a war. Among the rest, two expeditions were planned by Sir Charles Wager, then at the head of the admiralty, and two gentlemen named by him for carrying them into execution; which were no sooner laid before the privy council to be examined than they were unanimously approved.

Captain Anson, who was nominated to command the one, being out upon a cruise, a vessel was dispatched to order him to return with his ship, the Centurion, to Portsmouth; and Mr. Cornwall, who was appointed to command the other, was acquainted with the honour conferred upon him, and directed to prepare accordingly.

There are not to be found in the annals of Britain two expeditions, remote in the destination, yet having a connection one with the other, that promised equal advantages with these to the nation, equal honour to the promoters, or equal wealth and glory to the commanders: but by what fatality these expeditions were changed, or by what state-craft one came to be laid aside, and the other delayed,—who were the traitors that betrayed the secret of their destination, or who the demon of seduction was, that perverted the grand design to the pitiful purpose of one single pilfering project, remains at present among those secrets, which, perhaps, a second Dalrymple, in some remote period of time, may discover; when it will probably appear how much the influence of Chilian gold had operated in defeating the most formidable project for the humiliation of Spain that ever was devised; and how easy it is for a prime minister of England, in the plenitude of power, to defeat the best-concerted measures, backed and supported by the King in his council, when either pride, envy, avarice, or emulation, may prompt him to opposition.

The project, as first intended, was to consist of two strong squadrons; one under Captain Anson, was to take on board three independent companies of 100 men each, and Bland's regiment of foot (who was himself to command the land forces), and was to sail with all possible expedition by the Cape of Good Hope to the city of Manilla, in the island of Luconia; while that

commanded by Captain Cornwall, of equal force, was to proceed round Cape Horn into the South Seas, there to range the coasts of Chili, Peru, and Mexico; and when the commander in chief had made himself master of the royal treasures in that quarter, he was then to direct his course to the Philippines, and join the Squadron of Captain Anson. This done, they were to act in conjunction, as circumstances should arise, or to wait for fresh orders from government to proceed on fresh enterprises. The reader will perceive, at first view, the vast importance of this noble undertaking, calculated at once to enrich the nation, and to determine the war without the effusion of much blood; for the places intended to be attacked were at that time incapable of resistance; and as they were in possession of the royal treasures, any failure in the return of which must of necessity oblige Spain to sue for peace, that haughty nation must thus have been subdued without a battle. But posterity will stand amazed when they are told the issue of this project, on which Sir Charles Wager was so intent, that, though it was the 10th of September before Captain Anson arrived in town, yet by the 18th he had received orders to take under his command the Argyle, Severn, Pearl, Wager, and Trial sloop, and to proceed to victual the fame with the utmost expedition.

Before the end of December such dispatch had been made by that vigilant officer, that the ships were in readiness to take the troops on board, but in January, when Captain Anson attended the board to receive further orders, he was told by Sir Charles, that the Manilla expedition was laid aside, for what reason he knew not, but that the expedition to the South Seas was still intended; and that he and his Squadron, as their first destination was now countermanded, should be employed in that service.

Accordingly on the 10th of January, 1740, he received his commission as Commodore; yet it was not till the 10th of June that he obtained from the Duke of Newcastle his Majesty's instructions; and even then so many obstacles were thrown in the way, so many difficulties started, and so many delays contrived, that, before he was permitted to sail, which was not till the latter end of September, the Spaniards were so well informed of his designs, that a person who had been employed in the South Sea Company's service, arrived from Panama, and was able to relate to the Commodore most of the particulars of his strength and destination, from what he had learnt among the merchants before he left the South Seas; but a still more extraordinary proof of their early and perfect intelligence was discovered afterwards, in the course of the voyage, when

Published as the Act directs, by Alex. Hogg, at the Kings Arms, N^o 16, Paternoster Row.

COMMODORE (afterwards LORD) ANSON, attending KING GEORGE the SECOND, with an Account of his VOYAGE ROUND the WORLD.

THE RIVER OF THE GREAT FALLS
AND THE GREAT FALLS OF THE RIVER

when the Pearl, being separated from the rest of the squadron, in a storm, on the coast of Brasil, fell in with the Spanish fleet, that, during the unprecedented delay, had been purposely fitted out to ruin the expedition, and found Admiral Pizarro so well instructed in the form and make of Commodore Anson's broad pendant, and those he employed had imitated it so exactly, that Capt. Mitchell, who commanded the Pearl, was decoyed by it within gun-shot, before he was able to discover his mistake.

All delays being at length overcome, the squadron, consisting of five men of war, a sloop of war, and two victualling ships, namely, the *Centurion*, of 60 guns, 400 men, commanded by Captain Anson, as Commodore; the *Gloucester*, of 50 guns, 300 men, of which Richard Norris, Esq; was Commander; the *Severn*, of 50 guns, 300 men, the Hon. Edward Legg, Esq; Commander; the *Pearl*, of 40 guns, 250 men, Matthew Mitchell, Esq; Commander; the *Wager*, of 28 guns, 160 men, the Hon. John Murray, Commander; two victuallers, the *Industry* and *Anne* pinks, the largest of about 400, and the other about 200 tons burthen; were ordered to take the troops on board at St. Helen's. But how much the numbers, strength, and probability of success, of this squadron, were diminished by the various incidents that took place in near a twelve-month's procrastination, may fully be conceived by what has already been said. Had the honourable Board from whence the first idea of the expedition originated been permitted to direct, all the old and ordinary seamen on board the ships would have been exchanged for such as were young and able; the full complement of each ship would have been made up; and the salt provisions which had been so long on board in the channel would have been remanded on shore, and fresh provisions replaced in their room: but, instead of these necessary precautions, the Captains were glad to retain their old crews; the deficiency in the numbers of which, amounting to more than 300 men, was no otherwise made up than by sending on board about 100 cripples from the hospitals, and a party of raw marines who had never been at sea before: nor were they more fortunate in the change that was made in the land-forces; for, instead of three independent companies, of 100 men each, and Bland's regiment of foot, as first promised, they had only 400 invalids from Chelsea allotted them, one part of whom was incapable of action by their age and infirmities, and the other part useless by their ignorance of their duty. But this diminution of strength was not the greatest misfortune that attended these measures; the importance of the time which was wilfully wasted was in its consequences the source of all those calamities to which the enterprize was afterwards exposed, by obliging the Commodore to make his passage round the Cape in the most tempestuous season, when, as it was foreseen, almost all the invalids, to a man, perished long before they arrived at the place of action, expiring in a most lamentable condition when they came to be attacked with the scurvy, with their wounds bleeding afresh, which had been healed some of them 20, some 30, and some 40 years before.

But to proceed: Of this voyage there are two very authentic and well-written accounts; one by Pasco Thomas, the mathematical master on board the *Centurion*, who failed in her out of the British Channel, and returned with her in safety when she arrived at Portsmouth, and was an eye-witness and careful observer of all that passed: the other by the Rev. Mr. Richard Walters, Chaplain to the above ship, who received his materials, and every other assistance necessary to authenticate his narration, from the Commander in Chief.

We have chosen to follow the former in the narrative of facts, as most exact and least liable to imposition; but, in the explanatory part, we shall copy the latter; because, though Mr. Thomas suffered nothing material that passed to escape his notice, there were many things transacted, the motives for which he could only

No. 41.

guess at; but these motives Mr. Walters has, by means of the Commodore's assistance, been able to explain.

Being quite ready about the beginning of September, 1740, we put to sea three different times, but were as often put back to the road of St. Helen's by contrary winds and stormy weather. At last, on Thursday, Sept. 18, we sailed in company with the *Lark* and *St. Alban's*, two of his Majesty's ships, and several merchant-ships, besides our own squadron; and Saturday evening saw some men-of-war, and a large fleet of merchantmen, waiting for us at Torbay. At one in the afternoon we joined them; and the Commodore hoisted his broad pendant, which was saluted by all his Majesty's ships in the fleet with 13 guns each. The King's ships which joined us here were, the *Dragon*, *Chatham*, *Winchester*, and *South-Sea-Castle*, and near 200 sail of merchantmen under convoy, some of whom were bound to the Mediterranean, and others to several parts of North America. We had at present the command of the whole fleet; and this same afternoon, seeing a ship to the south-west, we made the *Dragon* a signal for chasing her; but she proved one of our own ships, too far a-head of her station. At four this afternoon, the *Start Point* bore from us E. by N. at the distance of eight leagues.

Monday the 22d, we saw two sail to the westward, and sent the *Trial* sloop to speak with them. They were Dutch ships bound to Curaçoa, with soldiers for their garrisons there.

Thursday the 25th, the *Winchester* and *South-Sea-Castle*, with the merchant-ships under their convoy for Virginia, and other parts of North-America, parted from us, and proceeded on their respective voyages. And Monday the 29th, the *Dragon*, *Chatham*, *St. Alban's*, and *Lark*, with the merchant-ships in their charge for the Mediterranean, did the like; and we had now no ships left in company but our own proper squadron.

Tuesday the 30th, we spoke with a Dutch man-of-war, who came from Malta, bound for Amsterdam.

Friday, October the 3d, we spoke with two English merchant-ships from Lisbon for New-York, and the 8th we spoke with a French sloop from Rochelle. The 13th, one Philip Merrit, a common sailor, died, which I mention because he was the first man we lost on the voyage. The next day, by an order from the Commodore, we went to short allowance; that is, one third of the allowance granted by government is kept back, in order to make our provisions hold out the longer. The 23d, we spoke with a ship from Liverpool, and the next day with another from Glasgow, for the Cape de Verde islands; as also with a small brigantine from Falmouth for Madeira, who kept us company thither. The next day we spoke with a Dutch ship from Surinam for Holland. The 26th, at six o'clock in the morning, we saw the land bearing W. N. W. distance six leagues, and at four in the evening anchored in Fonchiale road, in forty fathom water, a-bread the town of Fonchiale, and about a mile and a half from it. During this whole passage, we had almost continually contrary winds, and boisterous uncertain weather; by which means, a passage which is very commonly made in 10 or 12 days, took us up 38.

Our business in this place was only to water, and take in wine, and some private stock: but, soon after our arrival, we were informed, that they had seen from the island, to the westward, about 16 or 18 sail of ships for several days together, which were supposed to be a junction of French and Spanish ships of war; and as we had reason to imagine that our expedition had long been known, there was little room to doubt, but that those ships were designed to intercept and destroy us before we could attempt any thing to the prejudice of Spain. On this news the Commodore sent out an English privateer which lay in the road, with one of his own officers, to see if they could discover them at sea, and what they were; but she returned the next day, having made no discovery.

Nov. 2, Captain Norris, at his own request, being in an ill state of health, with the consent of the Commodore

dore quitted the command of the Gloucester, in order to return to England. The Gloucester was hereupon given to Captain Mitchell, the Pearl to Captain Kidd, the Wager to the Hon. Captain Murray, and the Trial sloop to David Cheap, our First Lieutenant; and as one of the Lieutenants of the Gloucester had quitted with Captain Norris, our two mates, who had long depended on the Commodore, were preferred to be Lieutenants on this occasion.

The 4th, at four in the afternoon, we weighed and put to sea, with all the squadron under our command. An English sloop, which lay in the road, saluted us at our departure with nine guns, to which we returned five.

The 6th, at four o'clock in the evening, we saw the island of Palma, one of the Canary islands, in the latitude of 29 degrees north, and longitude from the meridian of London 19 degrees 44 minutes west. The same day we spoke with a French ship from Marseilles bound to Martinico, and the next morning with a Dutch ship from Amsterdam bound to Batavia, the metropolis of the Dutch settlements in the East-Indies.

The 11th, about four in the morning, we crossed the Northern Tropic for the first time in this voyage, in long. 24 deg. 24. min. west from London.

The 16th, being in the latitude of about 12 deg. 20 min. and the contract with our victuallers expiring in that latitude, the Anne pink fired a gun, and hoisted a red flag at her fore-top-mast head, to give us notice of it.

On the next day all the Lieutenants of the squadron were by a signal ordered on board the Centurion, and orders were given to unlade the Industry pink, and each ship to take on board from her their respective quotas of provisions; in pursuance of which we immediately began to unlade her, lying by in the day, and making an easy fail in the night.

The 19th, having unloaded and discharged the Industry, at eight in the evening she parted from us, in order to proceed to Barbadoes, whither she was bound; but the Commodore having entered into a new contract with the master of the Anne pink, she was detained with us for his Majesty's service, our ships being too much encumbered to admit of taking on board any more provisions at this time.

The 28th, about five in the morning, we crossed the Equinoctial, in the longitude of 28 deg. 15 min. W. from London, the variation of the compass at that place being 35 min. E.

December the 2d, at eight in the morning, we saw a fail to the north-west, to which we gave chase. At night we lost sight of her; but next morning we saw her and gave chase again, but in the afternoon quitted her. We imagined this fail to be a tender on the Spanish fleet, sent purposely to get intelligence of us; but on our arrival at the Cape of Good Hope, in our return home, we learned that she was the East-India Company's packet bound for the island of St. Helena.

The 10th, expecting to be near the coast of Brazil, we sounded, and found 67 fathom water, on which we fired a gun for a signal, and altered our course more to the southward. This day died Thomas Waller, our surgeon, who was succeeded by Henry Ettrick, surgeon of the Wager; the surgeon of the Trial succeeded him, and Joseph Allen, our surgeon's first mate, was made surgeon of the Trial.

The 11th, we spoke with a Portuguese brigantine from Rio Janeiro, bound to Santos, one of the principal Portuguese settlements in the Brazils. The 13th, we crossed the South Tropic for the first time, in long. 38 deg. 36 min. W. from London.

The 14th, died Robert Welden, our purser, who was succeeded by John Rule, purser of the Wager, and Commodore's Secretary; Thomas Harvey, one of our midshipmen, was made purser of the Wager, in the room of Mr. Rule.

The 17th, we saw the land of the Brazils, from W. to W. S. W. very mountainous, and full of woods. I have, for several days last past, found, by my observations, a strong current on this coast, setting to the

southward near three quarters of a mile an hour, which, perhaps, may be occasioned by the neighbourhood of the vast river of Rio de la Plata; another observation, which I shall have occasion to make after our leaving the coast of Brazil, will very much corroborate this conjecture.

The same day, at four in the evening, we had 40 fathom of water, muddy ground; the island of Alvorado, a small island at the north-east end of the large island of St. Katharine's, then bearing N. W. by N. about eight leagues distant; and the next day at seven in the evening we came to an anchor in twelve fathom water, the north-east end of St. Katharine's bearing S. S. W. about three miles distant, and the island of Alvorado, N. N. E. about six miles distant. Here we found the tide to set S. S. E. and N. N. W. We sent ashore a Lieutenant to the fort, to compliment the Governor, and to desire a pilot to carry us into the road. The Governor returned a very civil answer, and granted our request. The next morning we weighed and ran up the harbour, and about noon anchored in five fathom and a half water, in a place they there call Buon Porto; but being still too far from the watering-place, we on the 20th, about eleven in the morning, weighed and ran farther up between St. Katharine's and the main land of Brazil, and in the afternoon anchored and moored in five fathom water, about two miles from the watering-place; and the same evening our third Lieutenant went ashore with materials for building a tent, to shelter the people who were to be employed in watering. We likewise saluted the Portuguese fort with eleven guns, who returned us the like number.

Our ships beginning to be very sickly, tents were erected on shore, one for every ship, and the sick were sent ashore to them, with surgeons and proper attendance.

The agents for victualling, of which we had two with us, were ordered to procure what fresh provisions we could expend during our stay here, which they accordingly did; but though their meat, which is altogether beef, was both cheap and plenty, it was for the greatest part miserably bad, and scarce fit to be eaten.

The men throughout the whole squadron began now to drop off apace with fevers and fluxes, occasioned chiefly, I believe, by the violent heat of the climate, and the bad air; the country being so very woody that the air must thereby be stagnated, and rendered unhealthy.

We continued here wooding, watering, and overhauling our rigging, till Sunday, Jan. 18. 1741, during which time we had variable uncertain weather, sometimes sea and land breezes, at other times strong gales of wind, with heavy rain, thunder and lightning, but always excessive heat.

While we lay here, we gave our ship a thorough cleansing, smoaked her between decks, in order to destroy the vermin, and washed every part with vinegar, which I mention because it is absolutely necessary in large ships, the stench of so many sick persons being noisome in hot climates.

Dec. 21, I observed an eclipse of the moon, and by comparing the time of the end of it, with a calculation I purposely made of it in the meridian of London, from Sir Isaac Newton's New Theory of the Moon, I found the place where the ship then lay to be 49 deg. 53 min. to the westward of the meridian of London. The calculation itself, and the time it ended at St. Katharine's, I have unfortunately lost; but as the longitude is thereby settled, they are of no farther use, and not worth retrieving at the trouble of a new calculation.

Before we arrived at this island, we had received from the descriptions of Mr. Frezier, a French author, and some other persons who had been on the spot, such accounts as, together with the climate in which it is situated, gave us very great ideas of its fruitfulness, and hopes of a plentiful supply of every thing we wanted for a long run; but we found ourselves miserably mistaken in almost every article we expected.

As here are several fine sandy bays, we had very good fishing with a seine, for mullets, old wives, sting-rays, maids, turbot, and other flat fish, silver fish, bass, a very boney long fish like a bass, but which our seamen call a ten-pounder, and some other sorts. We likewise had fresh beef for present expending plenty enough, but scarce better than the carrion that we gave to our dogs. As for lemons, limes, plantains, bananas, potatoes, and other roots, fruits, and greens, with which those climates generally abound, which the authors above mentioned aver to be extremely plentiful here, and which we principally depended on for sea-stores, there were so few at the time of our being here, that I believe we could have consumed all that came to our knowledge of those things in one day. The officers, however, no doubt found plenty; as Mr. Walters agrees in his report with Frezier, that there was no want of pine-apples, peaches, grapes, lemons, citrons, melons, apricots, and adds, there were besides potatoes and onions for sea-stores. Sassafras is here in great plenty, and we cut much of it among other wood for fuel. Guaiacum they report to be very plenty here likewise, but I saw none of it, nor heard of any person who did during our stay. Rum and sugar they have in small quantities, but very indifferent and dear. The inhabitants are a mixture of Portuguese and Indians incorporated together, and appear to be very poor, idle, lazy, ignorant and rude. I believe the original of the Portuguese here was chiefly from felons, who fled hither from other parts of the Brazils to shelter themselves from justice; they never till lately having any government among them, except a Chief chosen from among themselves, who was more like a Captain of thieves and robbers, than the Commander of a colony. At present there are some European Soldiers, and a Governor from Rio Janeiro, whose name was Don José Silva de Paz, an expert engineer, who, as Mr. Walters observes, understood one branch of his business very well, which is the advantages which new works bring to those who are entrusted with the care of erecting them; for, besides a battery on a neck of land that narrows the channel to a little more than a quarter of a mile, there were three other forts carrying on for the defence of the harbour, none of which were then completed.

The country, both the main and the island, is mountainous, and all over-grown with thick woods, and those so entangled with the under-growth of thorny briars, brambles, and the like, that in most places they are scarce penetrable. These woods are reported to be full of very fierce tigers, which makes any excursions into the country dangerous, unless you go well armed, and even then much caution is necessary.

They have here some hogs and fowls, but I believe not very plenty; and in the woods are monkeys, apes, armadillos, and other wild creatures unknown to me; as also parrots, paroquets, and many other sorts of birds proper to the climate. Alligators are said to be plenty near the shores and in the lakes, but we saw none of them.

The country appears to me to be a good soil, and very capable of improvement, were the inhabitants more civilized and industrious.

This island lies in latitude 27 deg. 30 min. S. longitude, as before determined, 49 deg. 53 min. W. from London; and the variation of the compass 11 deg. 20 min. easterly.

Dec. 27, we discovered a sail in the offing, and the eighteen-oar'd barge was manned, and armed, and sent, under the command of the second Lieutenant of the Centurion, to examine her before she arrived within the protection of the fort. She proved to be a Portuguese brigantine from Rio Grande; but, though the officer behaved to the master with the utmost civility, yet the Governor took offence at our sending our boat, complained of the violation of the peace, and made that a pretence for sending Don Pizarro the most circumstantial intelligence of our force and condition, as we afterwards found by letters intercepted in the South Seas.

January 18, 1741, we left this island, having had a melancholy proof how much the healthiness of this place had been over-rated by former writers; for we found, that, though the Centurion alone had buried no less than 28 men since our arrival, the number of the sick in the same interval had increased to 96; and this very day we had three men die.

Before our departure the Commodore took every precaution to prevent a separation; but considering that, in such boisterous seas as we were about to encounter, he himself might be disabled, he called the officers together, and in a full council so ordered it, that, if but one ship escaped, the expedition should not be abandoned. Proper places of rendezvous were appointed; the time was settled for staying at these places; and, if the Commodore did not arrive in that time, the Captains were ordered to put themselves under the command of the senior, and to proceed without farther delay.

The 22d in the morning, we had very stormy weather, with some thunder, lightning, and rain; and the Trial carried away the head of her main-mast. A thick fog succeeding, we lay to, and soon after lost sight of the Pearl, the Trial, and the Anne pink. In the afternoon we got sight of and joined company with the Trial and the Anne, but the Pearl was still missing.

From hence to February the 13th, very variable weather, mostly foggy from latitude 35, or thereabouts, to latitude 39; the rest a mixture not much unlike our weather in England in the month of October, except that we had pretty often thunder and lightning, which are not so frequent with us in that month. Being past the latitude of 36 degrees to the southward, I observed the current, which had hitherto constantly set southerly, now on the contrary, set to the northward; and the great river of Rio de la Plata being situated in between 35 and 36 degrees south, strengthens my conjecture that those currents are occasioned by the flux and reflux of that mighty river.

February 13, we saw the land from S. by W. to S. half E. appearing plain, with very few risings, and of a very moderate height, our soundings at that time from 46 to 56 fathom, the first mud, the latter stony ground. This day, at four in the evening we were within about four miles of Cape Blanco on the coast of Patagonia, and in 12 fathom water; on which we hauled off, and ran along the coast, the soundings from 20 to 60 fathom water. At five the next morning we saw the land from W. by N. to S. W. half W. with an opening near the middle; which I believe to be the harbour of Port Desire, so called by Sir John Narborough. The northernmost land in sight is Cape Blanco, and the southernmost Penguin Island, so called from the great numbers of penguins about it, of which birds Sir John's ship's company killed and salted large quantities for provisions, and which he reports to be very good and wholesome food. Cape Blanco, is in the latitude of 47 deg. 10 min. S. longitude from St. Katharine's 17 deg. 38 min. W. which makes it from London 67 deg. 20 min. W. taking the N. E. point of St. Katharine's in 49 deg. 42 min. W. to be about 11 min. to the eastward of the place where the ship lay when I fixed it by observation.

The 17th, in the evening, we anchored about 17 or 18 leagues short of the harbour of Port St. Julian, so called by Sir Francis Drake, who touched there in his voyage round the globe, and where he condemned and executed Mr. Doughty, the next person in command to himself, on pretence of a conspiracy to murder him and ruin the expedition; whence a small island within the harbour is to this day called the Island of True Justice. The next morning we saw a sail at S. by E. which we believing to be the Pearl, made the signal for the return of all cruisers; but she not mind it, as I suppose not seeing it, we ordered the Gloucester to chase, and at two in the afternoon the Gloucester and her chase, which to our great satisfaction proved to be

be the Pearl, joined us. They informed us, that, on January the 31st, their Commander, Captain Dandy Kidd, died; and that on the 7th instant they were chased by five large ships, which they believed to be Spanish men of war, and were some time within gunshot of them, though they never fired a gun, having endeavoured to decoy the Pearl by hoisting a broad red pendant, like that of the English Commodore, at the Admiral's main-top-mast head, and hoping by that means to be taken for our Commodore, and so to inveigle and make sure of their prey; Captain Mitchell, thus decoyed, narrowly escaped them, by running through a space of water, where the tides or currents making a great rippling, the Spaniards, who thought it was rocky and broken ground, were afraid to follow her. These ships we supposed to be the Spanish Squadron, commanded by Admiral Pizarro, the same who got so great a name among them for his conduct in bringing home their fleet safe into Port Andero the last year, eluding the vigilance of our squadrons who waited for them off Cadiz, and was therefore looked on as the properest person to be sent to intercept us. We should not have been displeased, however, to have met them with our whole force, and did not much doubt to have either destroyed or disabled them. But the time of their destruction was not yet come; their miserable fate shall be related in its proper place.

We were now, being the 18th, sailing along shore for the harbour of St. Julian. I found the tide to set here N. and S. about a mile an hour. The time of flowing here on the full and change days is N. E. by E. and S. W. by W. nearest. We sent one of our boats with an officer in-shore, to sound and endeavour to discover the mouth of the harbour. At six in the evening we came to an anchor in 12 fathom water. At eight the lieutenant returned, having found the harbour. We sent ashore our boats to make farther discoveries, and to endeavour some to get fresh water, and others to procure salt, (of which Sir J. Narborough observed, when he was here, that in February there was enough of it to load 1000 ships) for the use of the squadron in the South Seas. We continued here till the 27th, during which time we stowed most of our empty casks, in order to clear our ships as much as possible, and got up and mounted such of our guns as we had before struck down into the hold in order to ease the ships; for now, not knowing how soon we might meet with the Spanish squadron, it was necessary to have them all in readiness. We could find no fresh water here, and but a very small quantity of salt, and no other refreshments whatever; all the country, as far as we could discover, being quite barren and desolate. We got some provisions out of the Anne victualler on board each of the other ships, repaired the Trial's mast, and assisted her and the victualler to overhaul and new-fix most of their rigging. Having lost the hopes of a supply of water here, we were put to the allowance of one quart a man for one day, and three pints for another, alternately; but, considering our passage had hitherto proved extremely stormy and cold, and a dead time of the year coming on very fast, it was thought proper, in order to keep the people in as good heart as possible, to give them whole allowance of all other provisions, which was ordered accordingly.

Here we farther secured our lower-deck guns, by nailing quoins under the trucks, in case the tackles, breechings, or iron-work, might give way, or fail in the stormy weather which we had much reason to expect.

Here likewise the Commodore removed the Hon. Captain Murray into the Pearl, in the room of Captain Kidd; and Captain Cheap into the Wager in the room of Captain Murray. He advanced Mr. Charles Saunders, his first lieutenant, to be commander of the Trial Sloop, in the room of Captain Cheap; and made Mr. Piercy Brett, first lieutenant of the Gloucester, second lieutenant of his own ship. The Trial being repaired, and the Pearl, who had thrown about 14 ton of water overboard when chased by the Spaniards, being sup-

plied from the other ships, we made ready to prosecute our voyage.

This harbour of Port St. Julian is a barred harbour, only fit to receive small ships and vessels. We lay off in the road about two miles from the mouth of it. It is not to be seen open from where we lay, one point shutting in another; and before any small ship or vessel pretends to venture into the harbour, they ought to send in their boats at low water, and fix poles or buoys on the ends of the shoals, which, in a manner, block up the passage. The country about it is pretty much on the level, except a few coping hillocks to the northward, and a pretty high one in the bay, which bears W. S. W. from the place where we lay at anchor. The latitude of Port St. Julian is 49 deg. 10 min. S. its longitude from London 69 deg. 48 min. W. and the variation of the compass 17 deg. 20 min. E. We had here uncertain boisterous weather, with much rain, some snow, and generally thick fog, with so much wind and sea as made us ride hard, and hastened our departure from this uneasy situation.

Sir John Narborough and some others write, that they have often seen and conversed with the inhabitants in this and other parts of Patagonia, and have given wonderful descriptions of them; but as we saw none of them, I have nothing to say of that sort, nor indeed do I think there is any thing in this wild part of the world worthy of the least notice.

The 27th, at six in the morning, we made the signal, weighed, and put to sea; but the Gloucester being long in weighing her anchor, and the weather proving thick and hazy, we soon lost sight of her, and at one in the afternoon, tacked, and lay by for her coming up; at seven we fired a gun, a signal for her, and soon after she joined us, having broke her main-yard in the flings.

Previous to our leaving this port, a council was held on board the Centurion, at which all the officers by sea and land attended, when it was proposed by the Commodore, that their first attempt, after their arrival in the South Seas, should be the attack of the town of Baldivia, the principal frontier of the district of Chili. To this proposition the council unanimously agreed; in consequence of which, new instructions were given to the Captains of the squadron, by which they were directed, in case of separation, to rendezvous at the island of Neufra Senoro del Secoro, and there cruise for 10 days; after which, they were ordered to repair to the height of Baldivia, and there between 40 deg. and 40 deg. 30 min. to continue to cruise 14 days longer; and, if in that time they were not joined by the rest of the squadron, they were then to quit that station, and direct their course to the island of Juan Fernandez.

March the 4th, in the morning, we passed by the Straights of Magellan, so near that we saw them very plain; the northernmost point of which, known by the name of Cape Virgin Mary, I found to be in the latitude of 52 deg. 28 min. S. longitude from London 72 deg. 55 min. W. variation of the compass 18 deg. 40 min. E. the soundings, when it bears about S. W. by W. at the distance of eight leagues, from 32 to 50 fathom, the bottom black-grey sand and mud. The afternoon of this day being very bright and clear, with small breezes, inclinable to calm, most of the Captains took the opportunity of this favourable weather to pay a visit to the Commodore; but, while they were in company together, they were all greatly alarmed by a sudden flame which burst out on board the Centurion, and which was succeeded by a cloud of smoke. However, they were soon relieved from their apprehensions, by receiving information, that the blast was occasioned by a spark of fire from the forge lighting on some gunpowder, and other combustibles, which the officers on board were preparing for use, in case we should fall in with the Spanish fleet; and that it had been extinguished without any danger to the ship.

The 6th, in the morning, we saw the land of Terra del Fuego, consisting of high craggy hills, towering above

Kingdom of St. Peter and St. Paul.

Printed by J. Smith

Edinburgh

above each other, mostly covered with snow, with deep horrid valleys, some few scattered trees, no plains, nor one cheerful green through all the dismal prospect; so that the whole may not improperly be termed the Land of Desolation; and I much question whether a more dreary aspect is to be seen in any other part of the habitable earth; for voyagers say this is inhabited, but surely its inhabitants must be the most miserable of human beings. This evening we lay by, that we might not overhoot the Straits of Le Maire in the night; though I believe, had we kept on, and passed round Staten Land, a small island or two, which lie to the eastward of those straits, and together with Terra del Fuego frame them, it would have been more to our advantage than by passing through them.

The 7th, at eight in the morning, we were very near a point of land on Terra del Fuego, called Cape St. James, bearing E. S. E. another called Cape St. Vincent, S. E. half E. the middlemost of the Three Brothers, being three high hills on Terra del Fuego, appearing almost contiguous to each other, S. by W. and a very high sugar-loaf hill, called Monte Gorda, farther up in the country, and appearing above them, bore south from us. It is by these marks that you know you are near Strait Le Maire; and indeed we began to open them in this position. By noon we were almost through them, being assisted by a very strong tide with much rippling, and which made to the southward somewhat before 10 o'clock in the morning. The course through is almost directly south, and there are no shoals nor rocks in the passage from whence you may incur any danger; the only thing you have to fear is, the tide's turning against you while you are in the straits, for in that case you are certainly hurried back again, and can have no passage there till the next turn of the tide. The breadth of this strait may be about six or seven leagues, and its length about seven or eight; which being passed, you enter into a vast open ocean, commonly known by the name of the South Sea. This strait lies in latitude 55 deg. S. longitude from London 67 deg. 30 min. W. variation of the compass 21 deg. 36 min. E. soundings in the straits from 43 to 58 fathom, the bottom black sand and pebble-stones. In passing through here, our joy was increased by the brightness of the sky and the serenity of the weather, which was indeed remarkably pleasing; for though the winter was now advancing apace, yet the morning of this day, in its brilliancy and mildness, gave place to none we had seen since our departure from England. But we here found what was constantly verified by all our observations in these high latitudes, that fair weather was ever the forerunner of a succeeding storm, and that sunshine and tempest followed one another like light and shade. We had scarcely reached the southern extremity of the straits, when the serenity of the sky, which had so much flattered our expectations, was all at once obscured, the wind shifted to the southward, and the sea began to swell to an astonishing height. Before night the tempest arose, and the tide, which had hitherto favoured us, turned furiously against us; so that, instead of pursuing our intended course, we were driven to the eastward, by the united force of wind and current, with so much precipitation, that in the morning we found ourselves seven leagues to the eastward of Strait Le Maire. From this time we had such a continual succession of tempestuous weather as surprized the oldest and most experienced mariners on board, and obliged them to confess, that what they had hitherto called storms were inconsiderable gales compared with the violence of these winds, which raised such short and at the same time such mountainous waves, as greatly surpassed in danger all seas known in any other part of the globe: and it was not without reason that this unusual appearance filled us with continual terror; for, had any one of these waves broke fairly over us, it must in all probability have sent us to the bottom. Nor did we escape with terror only; for the ship rolling incessantly gunwale-to, gave us such quick and violent motions,

No. 41.

that the men were in perpetual danger of being dashed against the masts or sides of the ship; and though we were extremely careful to secure ourselves from these shocks by grasping at some fixed body, yet many of our people were forced from their holds, some of whom were killed, and others greatly injured; in particular, one of our best seamen was carried over-board and drowned, another dislocated his neck, a third was thrown into the main hold, and broke his thigh, and one of our boatswain's mates broke his collar-bone twice; not to mention many other accidents of the same kind. These tempests, so dreadful in themselves, though unattended by any other unfavourable circumstance, were rendered more mischievous to us by their inequality, and the deceitful intervals which they at some times afforded; for, though we were often obliged to lie-to for days together under a reefed mizen, and were frequently reduced to lie at the mercy of the waves under our bare poles, yet now and then we ventured to make sail with our courses double reefed; and the weather proving more tolerable, would perhaps encourage us to set our top-sails: after which, the wind, without any previous notice, would return upon us with redoubled force, and would in an instant tear our sails from the yards. And, that no circumstance might be wanting which could aggravate our distress, these blasts generally brought with them a great quantity of snow and sleet, which cased our rigging, and froze our sails, thereby rendering them and our cordage brittle, and apt to snap upon the slightest strain, adding inexpressible difficulty and labour to the working of the ship, benumbing the limbs of the people employed in handling the sails, or handling the ropes, and making them incapable of exerting themselves with their usual activity, and even disabling many by mortifying their toes and fingers.

And now, as it were to add the finishing stroke to our misfortunes, our people began to be universally afflicted with that most terrible, obstinate, and, at sea, incurable disease, the scurvy, which quickly made a most dreadful havoc among us, beginning at first to carry off two or three a day, but soon increasing, and at last carrying off eight or ten; and as most of the living were very ill of the same distemper, and the little remainder who preserved their healths better, in a manner quite worn out with incessant labour, I have sometimes seen four or five dead bodies, some fown up in their hammocks, others not, washing about the decks, for want of help to bury them in the sea. But as the particulars of all the various disasters and sufferings of various kinds that befel us, would be endless, I shall only mention a few.

The 10th, 11th, and 12th, very stormy weather, with snow and sleet, and a very great overgrown sea from the S. W.

The 15th one William Baker fell overboard and was drowned. The 16th, the Anne pink, which had separated from us the 11th in the storm, again joined us, in lat. 59 deg. 20 min. S.

Part of the 17th, 18th, and 19th, very strong gales, and a great rolling sea from the N. W.

The 18th, we had again strong gales of wind with extreme cold, and at midnight the main-top-sail split, and one of the straps of the main dead-eyes broke.

The 23d, and part of the 24th, a most violent storm of wind, hail, and rain, with a very lofty sea. The 23d, in the evening, we sprung the main-top-sail yard, and split the main-sail into rags, the greatest part of which was blown overboard. On these accidents we furled all our other sails, and lay-to under a mizen.

The latter part of the 24th proving more moderate, we bent a new main-sail, got down the broken main-top-sail yard, and got up and rigged another in its place.

The 25th, it blew a very hurricane, and reduced us to the necessity of lying-to under our bare poles. As our ship kept the wind better than any of the rest, we were obliged in the afternoon to wear ship; in doing of which, we had no other expedient but clapping the helm a weather, and manning the fore-shrouds; in the

4 R

execution

execution of which we had one of our best men canted overboard. We perceived, that, notwithstanding the prodigious agitation of the waves, he swam very strong; and it was with the utmost concern that we found ourselves incapable of assisting him. Indeed we were the more grieved at his unhappy fate, as we lost sight of him struggling with the waves, and conceived, from the manner in which he swam, that he might continue sensible for a considerable time longer of the horror attending his irretrievable situation.

The 26th being somewhat more moderate, we found two of our main-shrouds broke, which we repaired; we likewise bent our main-top-sail, and made sail.

The 30th, in the evening, the Gloucester made a signal of distress; and, on speaking with her, we found she had broke her main-yard in the slings; an accident the more grievous, as it tended unavoidably to delay us in these inhospitable latitudes, where every moment we were in danger of perishing. The weather proving favourable; all the carpenters were ordered on board the Gloucester, and next day she was ready to sail.

The 3d, 4th, 5th, and 6th of April, a continued storm of wind and rain; a dreadful sea, and very cold weather. We lowered our yards, furled our courses, and lay by for the most part under a mizzen and mizzen-stay-sail. The 3d, about 11 o'clock at night, a raging sea took us on the larboard quarter, where it stove in the quarter gallery, and rushed into the ship like a deluge. For some time it laid the ship down upon her side; but she providentially righted again, though slowly; it threw down and half drowned all the people on the deck, broke one of the straps of the main dead-eyes, and snapped a mizzen and puttock shroud. This was the greatest sea which we had encountered since we came into those parts, and we met with but one such stroke more in the whole voyage; two or three such succeeding must certainly have sent us to the bottom.

The 7th, 8th, 9th, and 10th, continued very stormy and squally, with snow, hail, rain, and a large sea; the weather continuing very cold.

The 8th, at four in the evening, the Anne pink made a signal of distress; and, on speaking with her, we found she had sprung her fore-stay; and the gammoning of her bowsprit. This was the more unfortunate, as none of the carpenters were yet returned from the Gloucester. Nor was the Anne the only ship that suffered in this storm; the Wager lost her mizzen-mast and main-top-sail yard, owing to the badness of the iron work. In this dilemma we were obliged to bear away till these ships had made all fast.

The 10th, foggy and hazy. This afternoon the Severn and Pearl were far a-stern, and seemed to me to lag designedly. We made a very easy sail all day, and lay by at night, and fired several guns as a signal for them to join us; the weather being pretty moderate, and the wind fair for them, they might have effected it with ease. By the close of the evening we could but just see them, and from that time saw them no more. However, we heard afterwards in the South Seas, by letters taken on board some of the Spanish ships of their arrival at Rio Janeiro in the Brazils.

The 15th, the weather proved somewhat more moderate. At half an hour past one in the morning we saw two islands right a-head, at about two leagues distance; we immediately wore our ship, and stood off to the southward. Those islands were very unexpected, as well as unwelcome, we imagining we had been to the westward of all lands and islands of the coast of Terra del Fuego; but we now found our mistake, and that there was a necessity of our standing farther to the southward, in order to get a sufficient westing. Those islands I find to lie in the latitude of 54 deg. 20 min. S. longitude from London 84 deg. 10 min. W. Mr. Walters supposes the land we fell in with on this occasion to be Cape Noir, and a part of Terra del Fuego.

From this time to the 23d we had nothing remarkable, the weather continuing very uncertain and variable, with a large sea and a very cold air; and the 21st, at nine at night, we were in the latitude of 60 deg.

5 min. S. being the greatest south latitude we made during the voyage.

The 23d, very hard gales and squalls, with much rain. This evening we lost sight of the Gloucester, Wager, Trial, and Anne pink, being all the remainder of our Squadron, after the defection of the Severn and Pearl. The Wager's unfortunate catastrophe is well known; the others afterwards joined us at Juan Fernandez, as shall be related in its proper place.

The 24th, 25th, and 26th, the wind being mostly fair, though still blowing hard, we made pretty good runs under an easy sail to the north-westward. The 24th it blew a hurricane, and the men endeavouring to hand the top-sails, the clew-lines and bunt-lines broke, and the sheet being half flown, every seam in the fore-top-sail was soon split from top to bottom, and the main-top-sail shook so strongly in the wind, that it carried away the top lanthorn, and endangered the head of the mast; however, at length, some of the most daring of our men ventured upon the yard, and cut the sail away close to the reefs, though with the utmost hazard of their lives, whilst at the same time the fore-top-sail beat about the yard with so much fury that it was soon blown to shreds: nor was our attention to our top-sails our sole employment; for the main-sail blew loose, which obliged us to lower the yard to secure the sail, and the fore-yard being likewise lowered, we lay to under a mizen. The 25th, we found much of our running rigging broken, which we repaired. The 27th, we bent other top-sails in the places of those split. Nothing more remarkable the rest of this month and the first week in the next, but stormy uncertain weather, and great sickness and mortality among our people.

Friday, May 8, at seven in the morning, saw the main land of Patagonia appearing in high mountains covered mostly with snow. We likewise saw several islands, one of which we took to be the Island del Socorro, so called by Sir John Narborough, in his account of his voyage into those parts: and from the fine description this gentleman had given of this island, (having been there in the very height of summer), this place was appointed for our first general rendezvous in the South Seas. An unhappy appointment it was in its consequences; for when the people, already reduced to the last extremity, found this to be the place of rendezvous, where they had hoped to meet the rest of their companions with joy, and what a miserable part of the world it appeared to be, their grief gave way to despair; they saw no end of their sufferings, nor any door open to their safety. Those who had hitherto been well and in heart, now full of despondency, fell down, sickened, and died; and, to sum up this melancholy part, I verily believe, that our touching on this coast, the long stay we made here, and our hinderance by cross winds, which we should have avoided in a direct course to Juan Fernandez, lost us at least 60 or 70 of as stout and able men as any in the navy. This unspeakable distress was still aggravated by the difficulties we found in working the ship, as the scurvy had by this time destroyed no less than 200 of our men, and had in some degree affected almost the whole crew. It were, indeed, endless to recite minutely the various disasters, fatigues, and terrors, which we encountered on this coast; all these went on increasing till the 22d of May, at which time the fury of all the storms which we had hitherto experienced, seemed to be combined, and to have conspired our destruction. In this hurricane almost all our sails were split, and great part of our standing rigging broken; and, about eight in the evening, a mountainous overgrown sea took us on our starboard quarter, and gave us so prodigious a shock, that several of our shrouds broke with the jerk, by which our masts were in danger of coming by the board; our ballast and stores too were so strangely shifted, that the ship heeled afterwards two streaks a-port. Indeed, it was a most tremendous blow; and we were thrown into the utmost consternation, from the apprehension of instantly foundering. Our deplorable situation allowing no longer

ger any room for deliberation, we stood for the island of Juan Fernandez; and, to save time, which was now very precious, our men dying four, five, and six in a day, we endeavoured to hit the island upon a meridian course. On the 28th of May, being nearly in the parallel in which it is laid down, we expected to have seen it, and indeed the Commodore was persuaded that he did see it; but all the other officers being of opinion that it was only a cloud, to which the haziness of the weather gave too much colour, we made sail to the eastward, and by so doing lost near 14 days in recovering our westing again. This was a most fatal disappointment; for in this run we lost about 80 of our men, which, probably, had the Commodore's advice been attended to, would most of them have been saved.

The 8th of June, at six in the evening, we at length saw the island of Juan Fernandez, bearing N. by E. half E. about 15 or 16 leagues off. The 10th, at two in the morning, we anchored in 56 fathom, close under the N. E. end of the island. At 10 in the morning of the 11th, we with much labour and difficulty weighed our anchor, and at noon happily moored our ship in the Great Bay, about a mile from the shore, in 52 fathom water, to our inexpressible joy, having been from St. Katharine's in the Brazils to this place 148 days, on such a dreadful and fatal passage as I believe very few other persons ever experienced.

The 11th, at two in the afternoon, the Trial sloop appeared in the offing. We immediately sent some of our hands on board her, by whose assistance she was brought to an anchor between us and the land. We soon found that the sloop had not been exempted from the like calamities which we had so severely felt; for her Commander, Captain Saunders, waiting on the Commodore, informed him, that, out of his small complement, he had buried 34 of his men; and those who recovered were so universally afflicted with the scurvy, that only himself, his Lieutenant, and three of his men, were able to stand by the sails.

The same day we got out our long-boat, and sent her on shore with materials for building tents for the sick, and with orders to bring on board some water.

The 15th, we sent our pinnace to assist the Trial, she being driven from her anchors to sea, by the violent flaws of wind which blow off the high lands. This and the next day we put ashore 75 sick men, in so weak a condition, that we were obliged to carry them out of the ship in their hammocks, and to convey them afterwards in the same manner from the water-side over a stoney beach to the tents prepared for their reception. In this work of humanity, not only the officers, but the Commodore himself, cheerfully lent their assistance.

The 17th, the Trial came again to an anchor, and moored. This day and the next we sent on shore the remainder of our sick people, the whole number now on shore being 135, many of whom, being too far gone in the scurvy, died one after another to the number of not less than sixty.

We now began to send on shore materials for tents for the coopers, sail-makers, and some of the officers; a copper oven which we had with us for baking soft bread for the ship's company, and the smith's forge for making or repairing such iron-work as was necessary; and, after a short interval of relaxation, all hands were busily employed, some in cutting large quantities of wood for the ship's use, some in making charcoal for the smith, and for a farther store; the bakers in baking bread, the coopers in making up and cleaning the casks for water, the sail-makers in mending the sails and making others; some in fishing for the sick, and the rest were otherways employed: and here being very great plenty of fine fish, all taken by the hook, two or three people could never fail to take us as much in about two hours as all the ship's company could eat: besides this we took great quantities for salting and curing; and some private persons who had hooks and lines fished for themselves, and never failed of enough for their own use, and to give to those who had none. The people on board were employed in cleaning the

ship, which was in a very filthy condition, and in stripping the masts, and overhauling the rigging. One of the boatwain's mates, with some assistants, having run up a rope-walk on shore, was employed in making what small cordage we might want; others in watering, and, in short, in every thing that might contribute to put us in as good a condition, and in as short a time as possible; and as fast as the sick recovered, they were put on the like employments.

At first sight of this island, it appeared with a most unpromising aspect, being extremely mountainous, rugged, and irregular; but, upon our nearer approach, it improved upon us; and when we were landed, we found all the vegetables which are usually esteemed to be peculiarly adapted to the cure of those scorbutic disorders which are contracted by salt diet, and long continuance at sea; for here we found water-creffes and purslain, wild-forrel, and Sicilian-radishes in profusion. These vegetables, not to mention the turneps which now abound in every plain, with the fish and flesh we got here, were not only grateful to us in the extreme, but were likewise very refreshing to the sick, and contributed not a little to the recovery of those who were not already too far advanced in the disorder to admit of relief; and to the restoring of others to their wonted vigour, who, though not apparently under the malignancy of the distemper, and its baneful concomitants, were yet greatly debilitated, by continual watching and anxiety of mind, from which not a soul on board was exempt.

During the time of our residence here, we found the inland parts of the island no ways to fall short of the sanguine prepossessions we had first entertained in its favour; for the woods, which covered most of the steepest hills, were free from all bushes and underwood, and afforded an easy passage through every part of them; and the irregularities of the hills and precipices, in the northern part of the island, necessarily traced out, by their various combinations, a great number of romantic valleys, most of which had a stream of the clearest water running through them, that tumbled in cascades from rock to rock, as the bottom of the valley by the course of the neighbouring hills was at any time broken into a sudden sharp descent. Some particular spots occurred in these valleys, where the shades and fragrance of the contiguous woods, the loveliness of the over-hanging rocks, and the transparency and frequent falls of the neighbouring streams, presented scenes of such elegance and dignity, as would with difficulty be rivalled in any other part of the globe. It is in this place, perhaps, that the simple productions of unassisted nature may be said to excel all the fictitious descriptions of the most animated imagination. The spot where the Commodore pitched his tent, and where he chose, during his stay, to fix his residence, exceeded in beauty any thing that words can be supposed to represent. It was a delightful little lawn, that lay on an easy ascent at the distance of about half a mile from the sea, and was probably the very spot on which Shelvock twenty years before had pitched his tent. In front there was a large avenue cut through the woods to the sea-side, which sloping to the water with a gentle descent, opened a prospect to the bay and the ships at anchor. This lawn was screened behind by a tall wood of myrtle sweeping round it in the form of a theatre, the slope on which the wood stood rising with a much sharper ascent than the lawn itself, though not so much but that the hills and precipices within land towered up considerably above the tops of the trees, and added to the grandeur of the view. There were, besides, two streams of chrysal water, which ran on the right and left of the tent, within an hundred yards distance, and were shaded by the trees that skirted the lawn on either side, and completed the symmetry of the whole. Add to these, the gentle murmurings of the distant brooks, the music of the birds among the myrtles, the sweet aromatic odour of the spice-trees that every where perfumed the air with their fragrance, and you may form in imagination a faint idea of this second paradise.

dise, which could only be exceeded by the perfection of the first.

It is astonishing, that, among all the voyagers who have visited this fortunate island before us, and who have obliged the world with descriptions of it, none of them have mentioned a charming little bird that, with its wild, various, and irregular notes, enchants the ear, and makes the woods resound with its melody. This untutored choirster is somewhat less in size than the goldfinch, its plumage beautifully intermixed with red and other vivid colours, and the golden crown upon its head so bright and glowing, when seen in the full light of the sun, that it surpasses all description. These little birds are far from being uncommon or unfamiliar; for they perched upon the branches of the myrtle-trees so near us, and sung so cheerfully, as if they had been conscious we were strangers, and came to give us welcome.

There is, besides the above, another little bird, unnoticed by any former writer, and which seems likewise peculiar to the island, and consequently without a name; it is still less than the former in size, but not inferior in beauty, though not so musical; the back, wings, and head, are of a lively green, intermixed with fine shining golden spots, and the belly a snow white ground, with ebony coloured spots, so elegantly varied as no art can imitate. To the catalogue of birds mentioned by former writers as inhabitants of this island, should also be added blackbirds and thrushes very like those in England; and owls, but of a diminutive size.

Of four-footed animals we saw none but dogs, cats, rats, and goats; and of the latter but few, as the dogs of various kinds, grey-hounds, mastiffs, pointers, spaniels, and mungrels, have thinned them in the plains, and driven them to the inaccessible mountains; yet some were shot by the hunters, and were preferred by them to the best venison. Among those presented to the Commodore were two or three venerable through age, that had been marked more than thirty years before by Selkirk, who trained them for his sport, slit their ears, and turned them loose to graze the mountains.

I remember we had once an opportunity of observing a remarkable dispute betwixt a herd of those animals and a number of dogs; for going in our boat into the eastern bay we perceived some dogs run very eagerly upon the foot, and being willing to discover what game they were after, we lay upon our oars some time to view them, and at last saw them take a hill, where, looking a little farther, we observed upon the ridge of it an herd of goats, which seemed drawn up for their reception. There was a very narrow path skirted on each side by precipices, in which the leader of the herd posted himself fronting the enemy, the rest of the goats being ranged behind him where the ground was more open; as this spot was inaccessible by any other path, excepting where this champion had placed himself, the dogs, though they ran up hill with great alacrity, yet when they came within about twenty yards, found they durst not encounter this formidable Goliath, for he would infallibly have driven the first that approached him down the precipice; they therefore quietly laid themselves down, panting, and did not offer to stir while we remained in sight.

These dogs have multiplied prodigiously, and have destroyed most of the cats as well as goats; the rats, however, keep possession, and were very troublesome guests in the night, when they generally paid us their visits. It is not easy to determine in what manner such a multitude of dogs subsist, as they are much more numerous than all the other four-footed creatures upon the island. Our people, indeed, were inclined to think, that they lived in a great measure upon the young sealions and seals, and supported their opinion by the report of the sailors, some of whom killed the dogs for food, who said they tasted fishy; and, truly, there is hardly any other way of accounting for the subsistence of these animals; for, as has been said, they have already destroyed all the goats in the accessible parts of

the country; so that there now remain only a few among the crags and precipices, where the dogs cannot follow them. These are divided into separate herds of 20 or 30 each, which inhabit distinct fastnesses, and never mingle with each other; by this means we found it extremely difficult to kill them, and yet we were so desirous of their flesh, that we discovered, I believe, all their herds, and it was thought, by comparing their numbers, that they scarcely exceeded 200 upon the whole island. The dogs had destroyed the pardallas, too, of which former writers have given a large account, so that there was not one of them to be seen; we found indeed their burrows in the earth, which leaves no room to doubt of their being found in plenty in Selkirk's time, as well as cats, of which there is now scarce one alive.

Flesh meat being thus extremely scarce, our people, being tired of fish, though excellent in their kind, at length condescended to eat seals, which, by degrees, they came to relish, and called them lamb. Of these, it being their brooding time, the numbers were incredible;—and likewise of the sea-lion,—these animals have frequently furious battles among themselves, principally about their females; and we were one day surprized by the sight of two animals, which, at first, seemed different from all we had ever observed; but, on a nearer approach, they proved to be two sea-lions that had been goring one another with their tusks, and were covered with blood, with which they plentifully abound. This led us to watch them more closely, and one was observed larger than the rest, and from his driving off other males, and keeping a great number of females to himself, he was by the seamen humourously stiled the Bashaw. To this pre-eminence, however, he had not arrived without many bloody contests; for, on our people's attacking him in the midst of his seraglio of females, he made a desperate defence, and, when overpowered, the signals of his bravery appeared in numerous scars on every part of his body.

We had now been ten days on this island, when some of our people from an eminence discerned a ship to leeward with her courses even with the horizon, without any other sail abroad than her main-top-sail; from which circumstance, it was immediately concluded, that it was one of our own squadron; but the weather being hazy, no definite conjecture could be formed concerning her. She again disappeared for some days, and we were all thrown into the deepest concern, fearing the weakness of her condition had disabled her from working to windward, and that all her people had perished.

We continued our employ till the 26th, when we again saw the same ship; and, on her nearer approach, could distinguish her to be the Gloucester; and, making no doubt of her being in distress, the Commodore sent our boat on board her with water and refreshments. We found her in a miserable condition, not many above 100 people alive, and almost all those helpless with the scurvy; their water so very short, that they were obliged to allow but one pint a day to a man; and the continual flaws off the land, together with their being disabled in their sails and yards, hindered them from getting into the bay. The next day we sent them a fresh supply of fish, greens, water, and men to help to work the ship; soon after which the flaws drove them off again, and the ship appeared no more till the 30th, when at two in the afternoon she fired a gun, and made a signal of distress. She continued in this manner off and on, sometimes in sight, and sometimes not, till July 23, during which time, though we often relieved the people on board with water and other necessities, yet their sufferings were insupportable, and their whole complement were reduced to about 96 living persons, all of whom must have perished in a few days more, had not the wind proved favourable to bring them into the bay; but providentially a fresh gale sprung up from the sea, and brought them to an anchor. We immediately sent men on board to assist in mooring the ship, and continued our constant assistance afterwards, during

Spectacular view of the Mosquito Coast

Three Years on the Mosquito Coast

Three Years on the Mosquito Coast, by Capt. J. P. Dampier.

The SUCCESS wedged on a Rock, during at the same time between the fire of the SPANISH FORT at UMATA and a SLOOP on the HARBOR.

our stay at this place. The 5th of August, the Commodore sent the Trial sloop to search the island of Little Juan Fernandez, lest any of the Squadron should have mistaken that island for the place of rendezvous, and might remain there in expectation of meeting the rest of the fleet.

On the 16th, the Anne pink, which was separated from us with the rest of the Squadron the 23d of April, appeared in sight. Her arrival gave us new spirits, she being laden principally with provisions, and we immediately were ordered full allowance of bread. This ship had been about two months in a safe harbour, on the main land, near the same parallel with del Socorro, where she had been directed by Providence, and where she lay in security, enjoyed plenty, and her people, 16 in number, being once freed from their fears of shipwreck, very soon recovered their wonted vigour, having experienced none of those hardships that were endured by the rest of the fleet. They told us they had seen some Indians, and one time took one of their canoes with a man, a woman, some children, a dog, a cat, &c. and some implements for fishery; but in a day or two the whole family, the dog excepted, made their escape from them in the ship's small boat, and left them their canoe in her stead. Those Indians, they say, understood a few Spanish words, and probably might have some little correspondence with the southern Spaniards of Chili, or their nearer bordering Indians; or, perhaps, some of the Fathers for propagating the faith may now and then have been among them. The principal refreshments they met with in this port, were wild celery, nettletops, and sorrel; cockles and mussels of an extraordinary size; good store of geese, sheep, and penguins. They judged it to lie in lat. 45 deg. 30 min. S. and it may be known by an island which faces it, and which the inhabitants call Inchin, and by a river in which they found excellent fish.

This vessel, the Anne pink, was the last that joined us at Juan Fernandez. The remaining ships of the Squadron were the Severn, the Pearl, and the Wager store-ship. The Severn and Pearl, as has been already observed, parted company off Cape Noir, and, as we afterwards learned, put back to the Brazils; so that of all the ships that came into the South Seas, the Wager was the only ship that was missing. Captain Cheap, who commanded her, knowing the importance of the charge he had in trust, without which no enterprise on shore could be undertaken, was extremely solicitous to reach Baldivia as the last place of rendezvous, and the first to be attacked, before the rest of the Squadron should have finished their cruise, that no blame might rest upon him, if the attack of that city should be judged improper to be carried into execution. But, whilst this brave officer was exerting himself in endeavouring to keep clear of the land in making the island of del Socorro, he had the misfortune to dislocate his shoulder, and thereby to disable himself from prosecuting with vigour the purpose he had in view. The ship being little better than a wreck, the crew in a miserable desponding condition, the officers quite exhausted, the weather cold and stormy, and the wind and currents bearing in-shore, all these unlucky circumstances concurring, so entangled the ship with the land, that all the efforts of the feeble crew could not prevent her from running upon a sunken rock, where she grounded between two small islands, not a musquet-shot from the shore. In this situation she continued entire till every one on board might have reached the land in safety, and might have stored themselves with provisions, and every necessary for their present subsistence and future escape: but the moment the ship struck, all subordination ceased; one part of the crew got possession of the liquors, intoxicated themselves in a beastly manner, and grew frantic in their cups; another part began to furnish themselves with arms, and to make themselves masters of the money and things of most value on board; while the Captain, and some of the principal officers, endeavoured in vain to maintain

their authority, and to preserve a proper discipline among them, in order to effect the deliverance of as many as it was possible from the common danger in which all of them were involved; but the mutinous disposition that prevailed rendered every effort for their preservation ineffectual. Those who remained in possession of the ship and her stores, pointed the cannon, and fired at those who had gained the land; those at land grew riotous for want of provisions; nothing but anarchy and confusion prevailed; and, what added to the catastrophe, a midshipman named Cozens, who had busied himself in opposition to all good government, was, by the Captain, shot dead upon the spot. This put an end at once to all manner of subserviency; and after this every one thought himself at liberty to pursue what scheme he thought best for his own preservation.

Of about 150 persons who reached the shore, 30 died on the place; about 80 others, having converted the long-boat into a schooner, sailed to the southward, attended by the cutter. These, being distressed for want of provisions in redoubling Cape Horn, and having lost their cutter in a storm, suffered unprecedented hardships in their return to the coast of Brazil, where only 30 of them arrived to give an account of the miserable fate of their companions, several of whom died of hunger; others desired to be set on shore; and some, beginning to be mutinous, they landed and deserted. Of the 19 who were left behind in Wager Island with the Captain, 16 embarked on board the barge and the yawl, and attempted to escape to the northward; of these one was drowned in the yawl, and four were left on a desert part of the coast, where it is probable they all perished; the remaining 11, after a fruitless attempt to weather a point of land, called by the Spaniards Cape Tres Montes, were forced to return to Wager Island, from whence they first set out, where meeting with a Chiloe Indian, who could speak a little Spanish, they agreed with him to pilot them to Chiloe; but, after coasting along for four days, the Captain and his officers being on shore, five in number, the other six persuaded the Indian to put to sea without them, by which the rest were reduced to the sad necessity of travelling near 600 miles, sometimes by land, and sometimes by water, till at length, after a variety of misfortunes and hardships not to be paralleled in romance, four of them, namely, Captain Cheap, the Hon. Mr. Byron, who lately went round the world, Mr. Hamilton, and Mr. Campbell, arrived at Chiloe, where they were received by the Spaniards with great humanity. After some stay at Chiloe, the Captain and his three officers were sent to Valparaiso, and thence to St. Jago, the capital of Chili, where they continued above a year; but on advice of a cartel, the Captain, Mr. Byron, and Mr. Hamilton, were permitted to return to Europe; and Mr. Campbell, who in the mean time had changed his religion, chose to embark for Spain; but not meeting there with the encouragement he expected, he soon after returned to England, where he published an account of his adventures, but mentioned not a word of changing his religion, neither does he assign his reason for leaving Spain.

It is very remarkable, that the place where the Wager struck upon the rock, was so near the harbour where the Anne pink found shelter during the winter, that the Wager's people were within hearing of the pink's evening and morning gun, yet never had the thought to follow the sound, or to look out for any straggler from their own Squadron.

On the 22d, the Trial arrived from searching the island of Little Fernandez, and reported that it lies about 20 leagues due west from this where we lay; that it is about three leagues in compass, being very mountainous, with some woods and good runs of water, with multitudes of goats, fish, sea-lions, and seals, as with us; but no ships were to be seen, nor any marks of any having been there.

While we continued at Juan Fernandez, besides our necessary employments, we likewise began, and pretty

far advanced, a wharf for the better landing and embarking such necessaries as we had occasion for. We kept two ovens employed in baking bread for the ships companies, two smith's forges for repairing old and fitting new iron-work, and made abundance of charcoal for future use. The Commodore likewise ordered the carpenters to take a careful survey of the *Anne* pink, the master of which set forth, that she was in so rotten a condition, as not to be fit to proceed nor return without very considerable repairs; which representation upon a survey being found to be true, the Commodore purchased her materials at a fair valuation, and ordered her to be broke up, and her crew to be put on board the *Gloucester*, that ship not having hands enough left to navigate her, much less to fight her, in case of an attack from the enemy.

This island lies in latitude 33 deg. 40 min. S. and longitude 87 deg. 37 min. W. from London; distance from the main continent 105 leagues; compass, by the best accounts of those who had been round it, 12 or 13 leagues. There are two small and very commodious bays within the points, which form the large one where we lay, one to the eastward, the other to the westward of us, and no doubt several others in other parts of the island; variation, by an observation July 2, in the morning, 8 deg. 4 min. half E. 'Twas reported, that the S. W. end of the island is much more flat and level than that where we resided, and the goats more numerous, but wood scarcer.

On Tuesday, Sept. the 8th, at noon, we saw a sail at sea bearing N. E. by E. and, perceiving by our glasses that she could be none of our squadron, nor an English built ship, we fired a gun as a signal for getting all our people on board; and, having taken several men out of the *Trial*, bent our sails, set up our rigging, and split our small bower cable, at six in the evening, we weighed in pursuit of her. In the morning of the next day we got down our slumps, which are generally set up in bad weather instead of top-gallant masts, and in their place got up our top-gallant masts and yards, rigged them, and bent their sails. At eleven the same morning we mustered and quartered the ship's company. At noon the island of Juan Fernandez bore W. half S. distance eight leagues; the two next days we saw nothing of the chase, nor any thing remarkable.

Saturday, Sept. 12, at five in the morning we saw a sail to windward, which bore down towards us, and at about two leagues distance she hauled up the lee clue-garnet of her foresail, shewed her Spanish colours, and fired a gun, which we supposed to be a signal concerted between her and others which came out in company with her; but we not answering nor regarding it, she hauled close on a wind and stood from us, endeavouring to escape; upon which we gave chase, and it proving sometimes hazy and foggy, we were in danger of losing sight of her. About nine in the morning we tacked, and at noon coming within gun-shot, we fired five shot at her rigging to bring her to; but she keeping on her course, we fired four more, on which she struck her colours, and surrendered without making any opposition. This ship happened not to be the same we went out after. She proved a rich merchant-ship, having on board 18,000l. sterling in dollars and plate, with some jewels, and abundance of gold and silver twigs; but the bulk of her cargo consisted in sugars and base goods, most of the latter European, but some the produce of the country. She was called the *Nuestra Señora del Monte Carmelo*. She was of about 500 tons, was commanded by Don Manuel Zamorra, and had on board 13 passengers, most of them persons of fortune, amongst whom was the son of the Governor of the city of St. Jago, the capital of Chili. She came from Callao, a port of Lima, the capital of the empire of Peru, bound for Valparaíso in Chili, where those ships annually trade, exchanging silver in return for gold and corn, the latter being very scarce in Peru. Some of the prisoners informed us, that, if we had taken her in her return from Chili to Peru, we should have met with

as much gold in her as we had now found silver. She had in the whole a-board her 67 persons, many of them Indians and black slaves, who were afterwards very useful to us in assisting towards the ship's duty. She had been 27 days from Callao, and wanted not above two days fail to compleat her voyage when we took her.

We found in this ship, on search among the letters from some merchants in Lima to their friends in Chili, an account of the fate of the Spanish squadron which had been sent after us, viz. that, in attempting to pass the Cape, they had been forced to put back, after encountering the most terrible storms and most pressing famine, being reduced to two ounces of bread and half a pint of water each man a day; that, besides being grievously attacked by the scurvy, which had made greater havoc among them than among us, their ships were almost entirely disabled, their masts, sails, yards, rigging and hulls in a manner shattered and torn to pieces; that Admiral Pizarro, and one more of his squadron, after having suffered the greatest extremities, had got, with the utmost difficulty, to Buenos Ayres, on the River Plate; that another of the squadron, a ship of 70 guns, had been entirely lost near Rio Grande, and that two more had never been heard of; that on their return they had seen two large ships pass by very near them, which they supposed to be two ships of our squadron, but the weather proving stormy, and the sea running mountains high, they could not interfere with or attack each other. Those ships of ours we believed to be the *Severn* and the *Pearl*, and hoped they were safely arrived at some port of the Brazils. Those letters came over land from Buenos Ayres to Lima, and with them came others containing Admiral Pizarro's advice and instructions to the Viceroy of Peru concerning us; wherein he told him, that, though he himself had been forced back in such a miserable condition, not having above 80 or 100 of his men living, and his ships in so ill a state, that, till sufficient reinforcements could come to him from Old Spain, he could not possibly come into those seas, yet as the English were a stubborn and resolute people, and daring enough to persist obstinately in the most desperate undertakings, he did believe some of us might possibly get round; but as he experimentally knew what of necessity we must have suffered in that dreadful passage, he made no doubt but we should be in a very weak and defenceless condition; he therefore advised the Viceroy to fit out all the strength of shipping he could, and send them to cruise at the island of Juan Fernandez, where we must of necessity touch to refresh our people, and to repair our ships; and farther advised, that, in case of meeting us, they should not stand to fight or cannonade at a distance, in which possibly we might have the advantage, or make our escape, but should board us at once sword in hand; which must, if well executed, in our weak condition, infallibly prove the means of taking us.

This was a well-laid scheme, and in pursuance of it the Viceroy equipt three ships at Callao, one of 50, one of 30, and one of 20 guns, all double manned with the choicest men they could possibly procure, and sent them to wait for us accordingly. Those ships arrived at Juan Fernandez some time, I think, in May, and continued till about June the 6th, when, imagining that we must be either put back or lost, they quitted their station, and failed for the port of Conception in Chili, and by this means we luckily missed them: had it happened otherwise, as we arrived there with only our single ship, in such a defenceless condition, and had they put their orders in execution with any tolerable degree of resolution, we must in all human probability have fallen into their hands.

Our prisoners informed us further, that those ships, during their cruise, had met with a storm, in which they had received so much damage, that it must be at least two months before they could again be fit to go to sea. The whole of this intelligence was as favourable as we could have wished; and now we were at no loss to account for the fresh marks we found at Juan Fernandez, of

of that island's having been lately visited by some white people.

Sunday the 13th, having got on board most of the prisoners of note, and all the silver, we made sail for Juan Fernandez; and the weather proving very moderate, at six in the evening that island bore N. W. by N. at the distance of five leagues. At three the next morning we fired three guns, as a signal to the ships in the bay. At four we anchored, got in our small bower cable, which we had slipped at leaving the place, and moored our ship.

The 15th we employed in watering, and setting up our rigging, in order to pursue our voyage. And this day, the Commodore being informed that several merchant-ships were now pursuing their trade without fear of any surprize, the Trial was ordered out on a cruise, and proceeded immediately.

The 16th we got up a new top-gallant-mast, and wanting some cordage we were supplied with it from the Gloucester. This and the following days, until the 19th, we spent in getting every thing ready for sea with the utmost expedition.

The 19th we sent 28 of our prisoners on board the Gloucester, she being weakly manned, and those prisoners being good sailors. We likewise supplied the prize with two months provisions of all sorts, at full allowance, for 20 men; put all the guns belonging to the Anne pink on board of her; and, having left orders with Captain Mitchell, of the Gloucester, to burn the pink, together with her useless stores, and appointed him his station off the town of Payta, which is the place where the ships between Lima and Panama generally touch to deliver part of their cargoes to be dispersed through the inland parts of Peru, with orders to fail to that station as soon as possible, we weighed, and took leave of our winter residence, in company with the prize, which the Commodore had fitted up to cruise against the enemy.

The 21st, at four in the evening, we had the last sight of this island, it then bearing from us W. by N. at the distance of 17 leagues. The remaining days, until the 24th, we had variable and uncertain weather, in which we split our main-top-sail and fore-sail, and received some other slight damage.

The 24th, at five in the evening, being somewhat hazy, we saw two sail to windward, on which we cleared ship, in order to be ready to engage, the largest of the two ships bearing down upon us. At seven she came so near, that we hailed her in Spanish, and she answered in English, and told us, that she was a prize taken by the Trial, and that her consort was the Trial itself, which was very much disabled. At eleven the next morning, there being a hard gale and high sea, the Trial fired two guns as a signal of distress, and bore away before the wind, and we after her. The same day half an hour past noon we spoke with the Trial, and found she had sprung her main-mast, and that her main-top-mast had come by the board: and as we were all of us standing to the eastward next morning, with a fresh gale at south, she had the additional misfortune to spring her fore-mast; so that now she had not a mast left. This was a great obstruction; for now we had intelligence by the Trial's prize, that there were many ships at sea richly laden, and that they had no apprehensions of being attacked by us, having received intelligence that our squadron was either put back or destroyed. In the course, therefore, of the 48 hours we were detained in waiting upon the Trial, I am persuaded we missed the taking many valuable prizes. The result was, that a council being called, and all the officers convened together on board our ship, it was there concluded, that in her present condition the Trial could be of no farther service; and the Commodore, being resolved to separate the ships, in order to cruise upon the coast to the greatest advantage, gave orders to Captain Charles Saunders, the Commander, to burn the Trial, and in her room commissioned the Trial's prize for his Majesty's service, with the same Commander, officers, and people. This ship, the Trial's

prize, was called by the Spaniards the Nuestra Señora de Arinzazie; but, being now commissioned for his Majesty's service, she was henceforth called the Trial's Prize. She was the largest ship we took in those seas, being between 5 and 600 tons, and loaded with bale goods, sugar, and other commodities, to a considerable value, and about 5000l. in specie and wrought silver.

The 28th, at nine in the morning, we parted with the Trial and both the prizes.

The 30th, we saw the main land of Chili. This day we began to exercise our people with small arms, which was the first time we had done it since we came into those seas, and which we continued at all proper opportunities during the voyage.

On the 1st of October, we came in sight of the high land of Valparaiso, bearing N. E. half E. at the distance of about 14 leagues. This city lies in the latitude of 32 deg. 58 min. S. its longitude from London is by my account 80 deg. 37 min. W.

On the 5th, the Commodore, being informed that there were murmurings amongst the people, because the prize-money was not immediately divided, ordered the articles of war to be read; and after that remonstrated to them on the danger of mutiny, and said he had heard the reason of their discontent, but assured them their properties were secured by act of parliament as firmly as any one's own inheritance, and that the money, plate, &c. were weighed and marked in public; so that any capable person, if he pleased, might take an inventory of the whole. He then read an account of the particulars, and told them they might (if they pleased) make choice of any person to take an inventory for them, or buy their parts. This spread a visible joy, and gave content to every one. We continued cruising off the coast of Valparaiso till the 8th, when at twelve at night we broke the main-top-sail-yard in the flings, on which we unbent the top-sail and got down the broken yard. At ten in the morning we saw the high land of Choapa, and over it the Cordillera mountains, being part of that long ridge of mountains called the Andes, which run from one end of South America to the other, appearing exceedingly high, with their tops covered with snow.

The 14th, we crossed the south Tropic to the northward, and from this time, till we were some degrees to the northward of the Equator, met with nothing but fair weather and a smooth sea.

The 21st, at noon, the high land of Morro Quemado bore E. by N. at the distance of four leagues; and here we continued cruising off and on till Nov. 2, when, about six in the morning, we saw two sail of ships standing towards us; upon which we made a clear ship, and immediately gave them chase, when we soon perceived that they were the Trial and Centurion prizes. As we had the wind of them, we brought to, and waited their coming up, when Captain Saunders came on board, and acquainted the Commodore that he had cleared the Trial pursuant to his orders, and having scuttled her, he remained by her till she sunk; but that it was not till the 4th of October before this was effected, by reason of the great swell and hollow sea; that, during his attendance on the sloop, they were all driven so far to leeward, that they were afterwards obliged to stretch a long way to the westward, to regain the ground they had lost; that in their cruise they had met no prize, nor had seen any vessel on all the coast.

November the 3rd, at five in the evening, the island of Asia, in latitude 13 deg. 5 min. S. longitude 84 deg. 43 min. W. bore from us N. E. by E. distance five leagues.

The 5th, at four in the evening, we saw the high land of Barranca, bearing N. E. by E. distant eight or nine leagues; and half an hour after we saw a sail to the northward, to whom we gave chase, and cleared our ship for engaging. At ten in the evening we came up with her, fired eight guns, and took her. She came from Guayaquil, and was bound for Callao, with timber,

timber, cocoa, cordage, tobacco, cocoa-nuts, and a small trunk with bale goods; all of little value to us, though a very considerable loss to the Spaniards. She was called the Santa Teresa, commanded by Don Bartolo Urrunaga, with between 30 and 40 people on board, passengers included, and five or six women, besides children. Our third lieutenant, two other officers, and a party of sailors, were sent on board to command and take care of her; and our other prizes being far astern, occasioned by our chasing this ship, we lay by till four the next morning, and fired a gun every hour as a signal for their joining us. This day I find, by the difference of our dead reckoning and observations, a current to set along this coast to the northward of near a mile an hour.

The 7th, we were employed in getting aboard several necessary stores, as planks, cordage, and the like, from our last prize, for the use of the squadron. The sea here appeared for several miles of a blood-red colour, which the prisoners informed us was common in those parts. This day we found aboard the prize, in specie and plate, 50 pounds averdupois weight.

The 9th, we brought from on board the Teresa 10 ferons of cocoa, one of wax, and 180 fathom of three and a half rope.

The 10th, we brought from on board our first prize the Carmelo, the following goods, viz. cloth two bales, bays five ditto, sugar 182 loaves, straw mats two, tar one skin, raisins three bales, indigo four ferons, cotton cloth one bale, hats two cases, and 25 loose ones, skins one parcel, chocolate one bag, camlet one bale and two parcels, silks one box, lead four pigs, and combs one small parcel.

The 12th, at five in the morning, we saw a sail, to which we gave chase; but there being very little wind, we manned and armed our barge, pinnace, and the Trial's pinnace, and sent them to take her, and at eight they boarded and took her, and brought her to us at half an hour past ten. She was called the Carman, commanded by Signior Marcus Marina, and came out of Payta the day before, bound to Callao, laden with iron and cloth, being a very valuable cargo. We found on board an Irishman, named John Williams, who pretended himself a prisoner amongst them, and with much seeming joy entered with us. He informed us, that, amongst other ships in the port of Payta, they left in the road a bark which was taking in 400,000 dollars, with which she would sail for Panama in a day or two at farthest; and the Spanish prisoners being examined, and confirming the intelligence, and farther giving some account of the strength of the place, the Commodore resolved to attack it this very night, and made preparations accordingly. Mr. Thomas Simmers, mate of our ship, with one midshipman and about 10 or 11 men, were sent to command and take care of this last prize. At four in the afternoon, Point Nonera bore E. by S. half S. distant eight leagues. At ten at night, we sent our barge, pinnace, and Trial's pinnace, to attack the town of Payta by surprise. They had 49 men well armed, and were commanded by the lieutenants Brett, Dennis, and Hughes, who had orders, if possible, to secure the governor of Payta, and send him prisoner on board, in order by that means to procure a supply of provisions, and a ransom for the town. Half an hour after eleven we founded, and found 43 fathom water, the ground mud, the island of Lobos bearing N. N. E. at the distance of three or four miles. At seven in the morning, Point Onado, being the point that forms the bay of Payta, bore S. S. E. two miles distant; and the town of Payta at the same time began to open in a direct line with it, distant about four miles; soon after which we saw our British colours flying on the castle. At ten the Trial's boat came on board, loaded with gold and silver, corn, wrought plate, jewels, and rich moveables. They informed us, that they took the town about two in the morning; and that, though the Spaniards had some time before been apprized of

our intent, they yet made a very faint resistance, having fired but two guns from their castle before our men landed, and a few small arms afterwards, when they all quitted the town with the greatest precipitation. The governor and his family made their escape in so much haste, that his lady was handed out of a window with no other cloths to cover her but her shift. All the inhabitants fled in the like confusion, except some negro women and children. In this action we lost one man, Peter Obrian, the Commodore's steward, who was shot through the breast by a musquet-ball; and had two wounded, to wit, Arthur Lusk, a quarter-master, and the Spanish pilot of the Teresa, whom we had made use of as a guide; the first through the fleshy part of the arm near the shoulder, the second through the wrist, but neither dangerously; and I have had it reported from several officers then on shore, that our men ran to the attack, and fired in so irregular a manner, that it was, and still remains a doubt, whether those were not shot by our people rather than by the enemy.

The town of Payta, at the time of the attack, had a fort with eight guns mounted, which commanded the town and harbour; and the balcony of the governor's house, which again commanded that fort, together with several other houses, was lined with armed men, of which there might be about 400 in the town; but these people having enjoyed a long peace, and being enervated by the luxury so customary in those parts, their arms in a bad condition, and no person of experience or courage to head them, it is no wonder that they made so small a resistance, and were all driven out of the town in less than half an hour by only 49 men; but I believe the noise of two drums which we made use of, together with the suddenness of the surprise, contributed to intimidate them, and facilitated our success.

On our getting possession of the castle, our commanding officer very inconsiderately ordered the guns to be thrown over the walls, which accordingly was executed; but some time after reflecting on the ill consequence which might attend that proceeding, he ordered two of them to be got up and re-mounted.

At eleven our barge came on board, loaded with money, plate, and jewels. This town contains about 140 or 150 houses; there are in it two churches, which, together with the governor's house and castle, are the only remarkable buildings. There are several large store-houses full of rich European, Asian, and American goods, all which were destroyed when we set the town on fire; of which in its place. The town lies in latitude 5 deg. 3 min. S. and longitude from London 88 deg. 48 min. W. This afternoon we employed ourselves in getting off the plunder, and provisions of hogs and fowls, which were here in great plenty. In the evening we anchored in 10 fathom water, the town bearing from us S. by E. half E. at about three miles distance, not being able to get farther in, by reason of the flaws of wind from off the land.

From this time to the 15th, we were employed in getting on board the plunder, which chiefly consisted of rich brocades, laced cloaths, bales of fine linens and woollens, Britannia's, flays, and the like; together with a great number of hogs, some sheep and fowls, cases of Spanish brandies and wines, a great quantity of onions, olives, sweet-meats, and many other things too tedious to name, all which the sailors hoped would have been equally divided among the ship's companies, but they found themselves disappointed.

We found in the road, one ship, two snows, one schooner, and two quarter-gallies, all which we took possession of. The 14th, in the morning, we saw a bark-log, as they call it, being a sort of raft made of the stumps of trees fastened together, overlaid with poles, and covered with small twigs twisted mat-wise, with several people in her coming along shore from the southward. She had a sort of mast and sail in her, and at first sight we knew not what to make of her; and none of our own boats being on board, we sent

the Carmen's boat, with Mr. Langdon, a midshipman, who commanded in the second place on board that ship, and some armed people, to pursue them, who perceiving it put on shore, and made their escape over the rocks. Mr. Langdon took their bark-log, which he found to be laden with dried fish, which we suppose they were carrying to Payta for a market. This evening the Spaniards, who had all along appeared in great numbers from the hills, and were now considerably increased, making a shew of warlike preparations, as if they designed in the night to attack our people in the town, they thereupon barricaded the streets, and kept very strict watches, to prevent a surprize. Several negroes delivered themselves up, desiring to be made prisoners, that they might have some food, and more especially water, to keep them from perishing; for the country thereabouts being for many miles round quite barren and sandy, without either water or any other thing necessary for life, and the nearest town to them, named as I think Sancta Cruz, whence relief might be got, being a day and a half or two days journey off, the people who had left the town were in a starving condition, and we had melancholy accounts of several dying among them for want chiefly of water during our small stay; and yet so greatly were they insatuated or frightened, that they never offered to treat for the ransom of the place, which if they had done, I believe it would not have been destroyed; in which case, they might have secured to themselves not only the habitations, but provisions and water enough (till they could have got a fresh recruit), which we should on that condition have readily left them.

The town seems to be very unhappily situated on that and some other accounts, they having no water but what is brought them by land-carriage from several leagues off; so that they are obliged to keep very considerable quantities by them in earthen jars, not only for their own use, but for the ships who frequently touch here, where they likewise often unload, and take in fresh cargoes. They are in the same case as to grain, bread, and almost all other necessities of life; and lie so open to an enemy, that the town has been often taken and ruined by the English, Dutch, and French; all which inconveniences, one would imagine, should tempt them to change their situation: but then the convenience of their trade is so great, being the only proper place they can pitch on for a mart between Panama and Peru, that they prefer this lucrative convenience to all other considerations.

Among the slaves who had desired to be entertained in our service, was one, who, having been a slave in Jamaica, had on the death of his master obtained his liberty, and thereupon entered himself a servant to one of the South Sea Company's factors, whom he accompanied to Porto Bello and Panama, and there got into the service of a Spanish gentleman, who took a great fancy to him, and with whom he went to Lima in Peru, where this master likewise dying left him a very considerable legacy; but the power being now in the hands of his executors, they not only defrauded him of this legacy, but made him a slave a second time. He was now at Payta with one of his new masters, on his passage from Lima to Panama, when he took this opportunity to come over to us; and being a very handy fellow, and accustomed to wait on gentlemen, he was immediately taken into the Commodore's service, came with us into England, and, I believe, continued with him till his death. This person gave us some information of the designs of the Spaniards on shore, and told us we had killed one or two of them, and wounded several others; but this account was never, that I know of, farther confirmed.

The 15th, in the morning, we sent on shore all our Spanish, and several of our Indian prisoners, keeping all the blacks and some of the Indians, to assist in working the ships, &c. To the blacks, who were all or most of them slaves, was promised their liberty in England, in case they would stand by and assist us

against our enemies the Spaniards; which they all promised very cordially: but we could soon discover, that, notwithstanding their seeming condescension, most of them would have much rather continued in the service of their old masters, than fail to accept of liberty with us; not that I believe those people were in love with slavery, or would not willingly have had their liberty, but then it must be on their own terms, the Spaniards in those parts being in great awe of the Indians, whom, though they have subdued, and seem to have incorporated among them, they dare not trust, but keep these blacks as guards, and use them well. The truth is, those Indians have still preserved, by tradition from father to son, the memory of the great cruelties which the first Spaniards exercised in those parts, and are angry enough at their present hard usage. They look on themselves as the natural lords of the country, and the Spaniards as covetous intruders, and cruel inhuman tyrants; and want only opportunity to make them sensible of their resentment, and to recover their lost country and liberty. 'Tis on this account that the Spaniards are very kind to their black slaves, whom they cherish and encourage highly, and look on them in the same light of a standing militia, always ready to arm against those Indians; so that, though the negroes in all other plantations in the West Indies are ever ready for revolts and rebellions, these on the contrary, are always ready to defend their kind masters with their lives. In effect they live very easy, are favoured by the Spaniards, and scorn and insult the poor Indians, who in return hate and detest both them and their masters; that being all that is left in their power.

This day an order was given to Mr. Brett, the then commanding officer on shore, to burn and destroy the town entirely, the two churches, which stood a little out of the way of the rest, only excepted; the Spaniards, as has been already said, never having made any advance towards treating for its ransom.

But now, before I entirely quit the relation of our transactions at this place, it may, perhaps, be expected, that I should give a more particular account of the booty we made, and of the loss the Spaniards sustained. I have already observed, that there were great quantities of valuable effects in the town; but, as most of them were what we could neither dispose of, nor carry away, the total of this merchandize can only be rudely guessed at. The Spaniards, in their representations sent to the Court of Madrid (as we were afterwards assured), estimated their whole loss at a million and a half of dollars; and when it is considered, that no small part of the goods we left behind us, were of the richest and most expensive species, as broad-cloths, silks, cambrics, velvets, &c. I cannot but think their valuation sufficiently moderate.

As to ourselves, the acquisition we made, though inconsiderable in comparison of what we destroyed, was yet far from despicable; for the wrought plate, dollars, and other coin, which fell into our hands, amounted to upwards of 30,000*l.* besides several rings, bracelets, and jewels, whose intrinsic value we could not then estimate; and over and above all this, the plunder, which became the property of the immediate captors, was very great; so that, upon the whole, it was by much the most important booty we met with upon that coast.

There remains still another matter to be related, which on account of the signal honour which our national character in those parts has thence received, and the reputation which our Commodore in particular has thereby acquired, merits a distinct and circumstantial discussion. I have already observed, that all the prisoners taken by us, were, before our departure, put on shore, and discharged, amongst whom there were some persons of considerable distinction, especially a youth of about 17 years of age, son of the Vice-president of the Council of Chili. As the barbarity of the buccaniers, and the artful uses the ecclesiastics had made of it, had filled the natives of those countries

with the most terrible ideas of English cruelty, we always found our prisoners, at their first coming on board us, to be extremely dejected, and under great horror and anxiety; particularly this youth, who, having never been from home before, lamented his captivity in the most moving manner, regretting, in very plaintive terms, his parents, his brothers, his sisters, and his native country; of all which, he was fully persuaded, he had taken his last farewell, believing that he was now devoted for the remaining part of his life to an abject and cruel servitude. Indeed, his companions on board, and all the Spaniards that came into our power, had the same desponding opinion of their situation. Mr. Anson constantly exerted his utmost endeavours to efface those terrifying impressions they had received of us, always taking care, that as many of the principal people among them as there was room for should dine at his table by turns; and giving the most peremptory orders, too, that they should always be treated with the utmost decency and humanity: but, notwithstanding this precaution, it was generally observed, that for the first day or two they did not quit their fears, suspecting the gentleness of their usage to be only preparatory to some unthought of calamity. However, being at length convinced of our sincerity, they grew perfectly easy in their situation, and remarkably cheerful; so that it was often disputable, whether or no they considered their being detained by us as a misfortune: for the youth I have above mentioned, who was near two months on board us, had at last so far conquered his melancholy fumes, and had taken such an affection to Mr. Anson, that it is doubtful to me, whether, if his own opinion had been asked, he would not have preferred a voyage to England in the *Centurion*, to the being set on shore at Payta, where he was at liberty to return to his country and friends.

This conduct of the Commodore to his prisoners, which was continued without interruption or deviation, gave them all the highest idea of his humanity and benevolence, and occasioned them, likewise, (as mankind are fond of forming general opinions) to entertain very favourable thoughts of the whole English nation. But whatever they might be disposed to think of Mr. Anson before the capture of the *Terésa*, their veneration for him was prodigiously increased by his conduct towards the ladies whom he took in that vessel; for, being informed that there were among them a mother and two daughters of exquisite beauty, who were of quality, he not only gave orders that they should be left in full possession of their own apartments, but also forbid, on the severest penalties, any of the common people on board from approaching them; and, that they might be the more certain of having these orders complied with, or of having the means of complaining if they were not, he permitted the pilot, who in Spanish ships is generally the second person on board, to stay with them as a guardian and protector. These were measures that seemed so different from what might have been expected from an enemy and an heretic, that the Spaniards on board, though they had themselves experienced his beneficence, were surprized at this new instance of it; and the more so, as all this was done without solicitation, and without the interposition of one friend to intercede in their favour. The ladies were so sensible of the obligations they owed him for the care and attention with which he protected them, that they absolutely refused to go on shore at Payta, till they had been permitted to wait on him on board the *Centurion* to return him thanks in person. Indeed, all the prisoners left us with the strongest assurances of their grateful remembrance of his uncommon treatment: a jesuit, in particular, whom the Commodore had taken, and who was an ecclesiastic of some distinction, could not help expressing himself with great thankfulness for the civilities he and his countrymen had found on board, declaring that he should consider it as his duty to do Mr. Anson justice at all times, adding that his usage of the men prisoners was

such as could never be forgotten, and such as he should never fail to acknowledge upon all occasions; but that his behaviour to the ladies was so extraordinary, and so extremely honourable, that he doubted if all the regard due to his own ecclesiastical character would be sufficient to render it credible. Indeed, we were afterwards informed, that he and the rest of our prisoners had not been silent on this head; but that, both at Lima and at other places, they had given the greatest encomiums to our Commodore; that the jesuit, in particular, as we were told, on his account, interpreted in a lax and hypothetical sense, that article of his church which asserts the impossibility of heretics being saved. But to return:

After we had finished our business, set the town in flames, and got the treasure on board, Mr. Brett, the officer who commanded the attack, having collected his men together, was directing his march towards the beach where the boats waited to take them on board, when the Spaniards on the hill behind the town, observing his retreat, resolved to try if they could not precipitate his departure, and thereby lay some foundation for future boasting. To this end a party of horse, all picked men, singled out for this daring enterprise, marched down the hill with much seeming resolution; so that, had we not entertained a just opinion of their prowess, we might have imagined, that, now we were upon the open beach, with no advantages of situation, they would certainly have charged us: but we presumed, and we were not mistaken, that all this was mere ostentation; for, notwithstanding the pomp and parade they at first came on with, Mr. Brett had no sooner ordered his men to halt and face about, than the enemy stoop to their career, and never dared to advance a step farther.

When our people arrived at their boats and were ready to go on board, they were for some time retarded by missing one of their number; and being unable, on their mutual enquiries among each other, to inform themselves where he was left, or by what accident detained, they, after a considerable delay, resolved to get into their boats and to depart without him: but when the last man was actually embarked, and the boats were just putting off, they heard him calling to them to take him in. The place was by this time so thoroughly on fire, and the smoke covered the beach so effectually, that they could scarcely discern him, though they heard his voice. However, the Lieutenant instantly ordered one of the boats to his relief, who found him up to the chin in water, for he had waded as far as he durst, being extremely frightened with the apprehensions of falling into the hands of an enemy, enraged, as they doubtless were, at the pillage and destruction of their town. On enquiring into the cause of his staying behind, it was found that he had taken that morning too large a dose of brandy, which had thrown him into so sound a sleep, that he did not awake till the fire came near enough to scorch him. He was strangely amazed, at first opening his eyes, to see the houses on a blaze on one side, and several Spaniards and Indians not far from him on the other. The greatness and suddenness of his fright instantly reduced him into a state of sobriety, and gave him sufficient presence of mind to push through the thickest of the smoke, as the likeliest means to escape the enemy; and, making the best of his way to the beach, he ran as far into the water as he durst (for he could not swim), before he ventured to look back.

By the time our people had helped their comrade out of the water, and were making the best of their way to the Squadron, the flames had taken possession of every part of the town, and burnt so furiously, both by means of the combustibles that had been distributed for that purpose, and by the slightness of the materials of which the houses were composed, and their aptitude to take fire, that it was sufficiently apparent no efforts of the enemy (though they flocked down in great numbers) could possibly put a stop to it, or prevent the entire destruction of the place, and all the merchandise

The REJOICINGS of the MEXICANS, at the beginning of the AGE.

chandize contained therein. Mr. Brett had the curiosity to delineate its appearance, together with that of the ships in the harbour.

Our detachment having now safely joined the squadron, the Commodore prepared to leave the place the same evening. At seven, Cape Blanco, in latitude 4 deg. 28 min. S. and longitude 88 deg. 16 min. W. from London, bore from us S. S. E. half E. about seven or eight miles distant. This afternoon and the next day we were employed in taking the most useful and valuable things out of the Santa Teresa and the Payta bark: we likewise designing to take every necessary thing which we conveniently could out of the Santa Teresa, in order to destroy her, and bring our strength into a less compass, we took her in tow, and set the Payta bark on fire with the same view. The next day we destroyed the Santa Teresa in the same manner, having got out of them both some anchors, cables, hawsers, yards, and top-malls, blocks, bales of goods, and several other necessaries.

The 17th, at three in the afternoon, the Gloucester, with a prize of hers in tow, joined us. This prize was called the Del Oro, and was chiefly laden with wine; however, out of her and a small boat which they took going along shore, they got, in gold, silver, and wrought plate, to about the value of 17 or 18,000l. These two were all the prizes the Gloucester took in those seas.

On board this prize of the Gloucester were two horses, which being, I suppose, fat, and probably better food than their salt beef or pork, they killed and eat them; and this, I imagine, gave ground to that fiction which one of the spurious accounts of our voyage has given, of our eagerly hunting and eating wild horses, whereas in reality we never saw nor heard of a wild horse during our voyage.

The Gloucester had chased two or three ships which had escaped her, and one of those touched at Payta; and though they could give no certain account that the ship which had chased them was an enemy, yet the circumstances they gave were so strong, that it put the people of Payta upon securing their treasure, and the best of their effects, not caring to be too well provided for the profit of such unwelcome visitors.

The 21st, at half past five in the morning, we saw the island of Plata, so called from Sir Francis Drake's having, as it is said, divided the treasure he took in the South Seas at this place. At two this afternoon the port of Manta bore S. E. by E. distant about eight or nine leagues. We at this time sent six months provisions on board the Carmen; and all the ships had orders, in case of separation, for several rendezvous on the coast of Mexico, or, in case of not meeting there, to make the best of their way to Macao, in China, where they were to await the arrival of the Commodore.

The 22nd, a division was made of the plunder of Payta, and the Commodore not appearing in that affair, it was done at the pleasure, and to the entire satisfaction, of five or six (no doubt) very disinterested officers; and, indeed, most things of this nature, during the course of the voyage being managed with the same discretion and honour, no room was left for complaining of particular partialities.

Here, however, we cannot help remarking a very considerable difference between the relation given by Falcone Thomas, and that given by Mr. Walters; the former having asserted, that the Commodore did not interfere in the distribution; the latter, that it was by his prudent management, that a jealousy, which had arisen between those who were the real captors, and those who remained on board the ship, was accommodated. Mr. Walters' account will set this matter in a true light; "And now, says he, (while the ships lay-to, in hopes of joining the Gloucester) a jealousy, which had taken its rise at Payta, between those who had been commanded on shore for the attack, and those who had continued on board, grew to such a height,

that the Commodore, being made acquainted with it, thought it necessary to interpose his authority to oppose it. The ground of this animosity was the plunder gotten at Payta, which those who had acted on shore had appropriated to themselves, considering it as a reward for the risks they had run, and the resolution they had shewn in that service. But those who had remained on board looked on this as a very partial and unjust procedure, urging, that, had it been left to their choice, they should have preferred the acting on shore to the continuing on board; that their duty while their comrades were on shore was extremely fatiguing; for, besides the labour of the day, they were constantly under arms all night, to secure the prisoners, whose numbers exceeded their own, and of whom it was then necessary to be extremely watchful, to prevent any attempts they might have formed in that critical conjuncture: that, upon the whole, it could not be denied, but that the presence of a sufficient force on board was as necessary to the success of the enterprise, as the action of the others on shore; and, therefore, those who had continued on board maintained, that they could not be deprived of their share of the plunder without manifest injustice. These were the contests amongst our men, which were carried on with great heat on both sides; and, though the plunder in question was a very trifle in comparison of the treasure taken in the place (in which there was no doubt but those on board had an equal right), yet as the obstinacy of the sailors is not always regulated by the importance of the matter in dispute, the Commodore thought it necessary to put a stop to this ferment betimes. Accordingly, the morning after our leaving Payta, he ordered all hands upon the quarter-deck, where addressing himself to those who had been detached on shore, he commended their behaviour, and thanked them for their services on that occasion; but then, representing to them the reasons urged by those who had continued on board, for an equal distribution of the plunder, he told them, that he thought these reasons very conclusive, and that the expectations of their comrades were justly founded; and therefore, he insisted, that, not only the men, but all the officers likewise who had been employed in taking the place, should produce the whole of their plunder immediately upon the quarter-deck, and that it should be impartially divided amongst the whole crew, in proportion to each man's rank and commission; and, to prevent those who had been in possession of the plunder from murmuring at this diminution of their share, the Commodore added, that, as an encouragement to others who might be hereafter employed on like services, he would give his entire share to be distributed amongst those who had been detached for the attack of the place. Thus, this troublesome affair, which, if permitted to have gone on, might, perhaps, have been attended with mischievous consequences, was, by the Commodore's prudence, soon appeased, to the general satisfaction of the ship's company: not but there were some few whose selfish dispositions were uninfluenced by the justice of this procedure, and who were incapable of discerning the force of equity, however glaring, when it tended to deprive them of any part of what they had once got into their hands."

Being now joined by the Gloucester and her prize, it was resolved that we should stand to the northward, and make the best of our way either to Cape St. Lucas on California, or to Cape Corientes on the coast of Mexico. Indeed, the Commodore when at Juan Fernandez, had determined to touch in the neighbourhood of Panama, and to endeavour to get some correspondence over land with the fleet under the command of Admiral Vernon; for when we departed from England, we left a large force at Portsmouth, which was intended to be sent to the West Indies, there to be employed in an expedition against some of the Spanish settlements. And Mr. Anson, taking it for granted that this enterprise had succeeded, and that Porto Bello perhaps might

might be then garrisoned by British troops, he hoped that, on his arrival at the isthmus, he should easily procure an intercourse with our countrymen on the other side, either by the Indians, who were greatly disposed in our favour, or even by the Spaniards themselves, some of whom for proper rewards might be induced to carry on this intelligence; which, after it was once begun, might be continued with very little difficulty; so that Mr. Anson flattered himself, that he might by this means have received a reinforcement of men from the other side, and that, by settling a prudent plan of operations with our Commanders in the West Indies, he might have taken even Panama itself, which would have given to the British nation the possession of that isthmus, whereby we should have been in effect masters of all the treasures of Peru.

Such were the projects which the Commodore revolved in his thoughts, at the island of Juan Fernandez, notwithstanding the feeble condition to which he was then reduced; but in examining the papers which were found on board the Carmelo, the first prize we took, we learned, that our attempts against Carthagena had failed, and that there was no probability that our fleet in that part of the world would engage in any new enterprize that would at all facilitate this plan. Mr. Anson therefore gave over all hopes of being reinforced across the isthmus, and consequently had no inducement at present to proceed to Panama, as he was incapable of attacking the place, and there was great reason to believe that, by this time, there was a general embargo on all the coast.

The only feasible measure, then, which was left us, was to steer as soon as possible to the southern parts of California, or to the adjacent coast of Mexico, there to cruise for the Manilla galleon, which we knew was now at sea, bound to the port of Acapulco; and we doubted not but to get on that station time enough to intercept her: but there was a business which we foresaw would occasion some delay, and that was the recruiting our water, it being impossible to think of venturing upon this passage to the coast of Mexico till we had procured a fresh supply. It was for some time a matter of deliberation, where we should take in this necessary article; but, by consulting the accounts of former navigators, and examining our prisoners, we at last resolved for the island of Quibo, situated at the mouth of the bay of Panama. Nor was it but on good grounds that the Commodore conceived this to be the properest place for watering the squadron. Indeed, there was a small island called Cocos, which was less out of our way than Quibo, where some of the buccaniers had pretended to find water; but none of our prisoners knew any thing of it, and it was thought too dangerous to risque the safety of the squadron, by exposing ourselves to the hazard of not meeting with water when we came there, on the mere authority of those legendary writers, of whose misrepresentations and falsties we had almost daily experience. Determined, therefore, to take in water at Quibo, we directed our course northward, being eight sail in company, and consequently having the appearance of a very formidable fleet; and on the 19th, at day-break, we discovered Cape Blanco, bearing S. S. E. half E. seven miles distant. By this time we found that our last prize, the *Solidad*, was far from answering the character given of her as a good sailer; and she and the *Santa Teresa* delaying us considerably, the Commodore commanded them to be cleared of every thing that might prove useful to the rest of the ships, and then to be burnt. And having given proper instructions; and appointed a rendezvous to the *Gloucester*, and to the prizes, in case of separation, we proceeded in our course for Quibo.

On the 25th, Point Manta bore S. E. by E. at seven miles distance, and there being a town of the same name in the neighbourhood, Captain Mitchell in the *Gloucester* took the opportunity of setting on shore several of his prisoners. The boats were now daily employed in distributing provisions on board the

prizes, to compleat their stock for six months; and then the Centurion might be the better prepared to give the Manilla ship a warm reception, if happily she should fall in our way, the carpenters were ordered to fix eight stocks on the main and fore tops, which were properly fitted for the mounting of swivel guns.

On the 25th, we had sight of the island of Gallo; and from hence we crossed the bay of Panama, shaping our course in a direct line for Quibo. Here we found, in a few days, a very considerable alteration in the climate; for, instead of that uniform temperature where neither the excess of heat or cold was prevalent, we had now close and sultry weather, like that we met with on the coast of Brazil. We had, besides, frequent calms and heavy rains, which we at first ascribed to the neighbourhood of the line, where this kind of weather is observed to obtain at all seasons of the year; but, finding that it attended us for more than seven degrees of north latitude, we began to suspect that the stormy season, or, as the Spaniards call it, the *Vandals*, was not yet past; though many writers, particularly Captain Shelvock, assert, that this season begins in June, and ends in November: but, perhaps, its end may not be always regular.

On the 27th, Captain Mitchell having cleared his largest prize, she was likewise set on fire; and now our fleet consisted only of five ships, and we were fortunate enough to find them all good sailers. On the 3rd of December we had a view of the island of Quibo, the east end of which bore from us N. N. W. four leagues distant, and the island of Quicara W. N. W. at about the same distance. When we had thus got sight of land, we found the wind to hang westerly; and therefore, night coming on, we thought it advisable to stand off till morning, as there are said to be some shoals at the entrance of the channel. At six the next morning, Point Marrato bore N. E. half N. three or four leagues distant. In weathering this point, all the squadron, except the Centurion, were very near it; and the *Gloucester*, being the leeward-most ship, was forced to tack and stand to the southward; so that we lost sight of her; and, the wind proving unfavourable, we saw her no more till we quitted the island. At seven in the evening we anchored in the Canal Bueno, or Good Channel, which is at least six miles in breadth, muddy ground. Next morning an officer was dispatched on shore to discover the watering-place, who, having found it, returned before noon; and then we sent our long-boat for a load of water, and at the same time weighed and stood further in with our ships, for the convenience of being sooner supplied; so that we were little more than two days in laying in all the wood and water we wanted. Whilst the ship continued here at anchor, the Commodore, attended by some of his officers, went in a boat to examine a bay which lay to the northward, and they afterwards ranged all along the eastern side of the island. In the places where they put on shore, in the course of this expedition, they generally found the soil to be rich, and met with great plenty of excellent water. In particular, near the north-east point of the island, they discovered a natural cascade, which surpassed, as they conceived, every thing of this kind which human art had ever yet produced. It was a river of transparent water, about 40 yards wide, which rolled down a declivity of near 150 feet in length. The channel itself was very irregular, intirely composed of rocks, both its sides and bottom being made up of large detached blocks, and by these the course of the water was frequently interrupted; for in some parts it ran sloping with a rapid but uniform motion, whilst in others it tumbled over ledges of rocks with a perpendicular descent. On the neighbourhood of this stream was a fine wood; and even the huge masses of rock which over-hung the water, and which by their various projections formed the inequalities of the channel, were covered with lofty forest trees. Whilst the Commodore, with those who accompanied him, were attentively viewing this place, and were remarking the

different blendings of the water, the rocks, and the wood, there came in sight, as it were to heighten and animate the prospect, a prodigious flight of mackaws, which, hovering over this spot, and often wheeling and playing on the wing above it, afforded a most brilliant appearance, by the glittering of the sun, and their variegated plumage; so that some of the spectators cannot refrain from a kind of transport when they recount the beauties which occurred in this extraordinary waterfall.

In three days we completed our business in this place, and were impatient to depart, that we might arrive time enough on the coast of Mexico, to intercept the galleon; but the wind, being contrary, detained us a night; and the next day, when we had gained an offing, while we were hovering about in hopes of getting sight of the Gloucester, we on the 20th discerned a small sail to the northward of us, to which we gave chase, and coming up with her took her. She proved to be a bark from Panama, called the *Jesu Nazareno*, laden with oakum, rock salt, and a small quantity of money to purchase a cargo of provisions at Cheripe, an inconsiderable village on the continent, which, however, has a good market, from whence future voyagers, in case of necessity may be plentifully supplied.

On the 12th of September we joined the Gloucester, who informed us, that, in tacking to the southward, on her first approach towards the island, she had sprung her fore-top-mast, which had disabled her from working to windward, and prevented her from joining us sooner. We now scuttled and sunk the *Jesu Nazareno*, and, on the 12th of December, stood to the westward, having previously delivered fresh instructions for the conduct of the fleet. We had now little doubt of arriving soon enough upon our intended station, as we expected, upon the increasing our offing from Quibo, to fall in with the regular trade-wind; but, to our extreme vexation, we were baffled for near a month, so that it was the 25th of December before we saw the island of Cocos, which, according to our reckoning, was only 100 leagues from the continent, and even then we had the mortification to make so little way, that we did not lose sight of that island again in five days. This island we found to be in the lat. of 5 deg. 20 min. N.

We had flattered ourselves, that the uncertain and western gales we met with were owing to the neighbourhood of the continent, from which as we got more distant, we hoped to be relieved by falling in with the eastern trade-wind; but in this too being disappointed, we began at length to despair of the great purpose we had in view. This produced a general dejection among us, as we had at first considered the project as almost infallible, and had indulged ourselves in the most boundless hopes of the advantages we should thence receive. However, our dependency was, in some measure, alleviated by a favourable change of the wind; and, as we now advanced a-pace towards our station, our hopes began again to revive. On the 17th of January, we were advanced to the latitude of 12 deg. 50 min. N. and, on the 26th of January, finding ourselves to the northward of Acapulco, we tacked and stood to the eastward, with a view of making the land; and we expected by our reckonings, to have fallen in with it on the 28th, yet, though the weather was perfectly clear, we had no sign of it at sun-set; about ten at night, we discovered a light on the larboard bow, bearing from us N. N. E. and, soon after, the *Trial's* prize made the signal for seeing a sail. As we had none of us any doubt but that what we saw was a ship's light, we were all extremely animated with a firm persuasion that it was the Manilla galleon, that had been so long the object of our wishes. We immediately cast off the *Carmelo*, and pressed forward with all our canvas, making a signal for the Gloucester to do the same. Thus we chased the light, keeping all our hands at their respective quarters, under an expectation of engaging within half an hour, as we sometimes conceived the chase, to be about a mile distant, and at other times to be within reach of our guns. In this constant and eager attention we continued all night,

No. 43.

always presuming that another quarter of an hour would bring us up to this Manilla ship, whose wealth we now estimated at round millions: but, when daylight came, we were most vexatiously disappointed, by finding that the light which had occasioned all this expectancy, was only a fire on the shore. At sun-rising, after this mortifying delusion, we found ourselves about nine leagues off land, extending from the N. W. to E. half N. On this land we observed two remarkable hammocks, which bore N. from us, and which a Spanish pilot and two Indians affirmed to be over the harbour of Acapulco; but we found them egregiously mistaken, these being in 17 deg. 56 min. whereas Acapulco lies in 17 deg. only.

Being now in the track of the Manilla galleon, it was a doubt with us, as it was near the end of January, whether she was or was not arrived: but, examining our prisoners about it, they assured us, she was sometimes known to come in after the middle of February; and they endeavoured to persuade us, that the fire we had seen on shore was a proof that she was yet at sea, it being customary, as they said, to make use of these fires as signals for her direction when she continued out longer than ordinary. On this reasoning of our prisoners, we resolved to cruise for her some days, and we accordingly spread our ships at the distance of 12 leagues from the coast, in such a manner that it was impossible she should pass us unobserved; however, not seeing her soon, we were very solicitous to gain some positive intelligence. With this view the Commodore resolved to send a boat under cover of the night into the harbour of Acapulco, to see if the Manilla ship was there or not. To execute this enterprize, the barge was dispatched the 6th of February, carrying a sufficient crew and two officers, as also a Spanish pilot and an Indian. Our barge did not return till the 11th, when the officers acquainted Mr. Anson, that they had mistaken the harbour, and that Acapulco lay a considerable distance more to the eastward, and that, not having a sufficient quantity of provisions for their passage thither, they were obliged to return to make known their disappointment. On this intelligence we made sail to the eastward, and the next day we dispatched the barge, with particular instructions to keep at a sufficient distance not to be seen from the shore. We watched six days without receiving any intelligence, so that we began to be uneasy for her safety; but on the 7th day she returned with advice, that, being at the very place they sought for, though they were then ignorant of their situation, they surprized a fishing canoe with three negroes, who told us that the Manilla galleon arrived at Acapulco on the 9th of January, but that, having delivered her cargo, she was taking in water and provisions in order to return; and that the Viceroy of Mexico had by proclamation fixed her departure from Acapulco to the 14th of March. This last news was most joyfully received by us, since we had no doubt but she must fall into our hands; and it was much more eligible to seize her on her return, than it would have been to have taken her before her arrival, as the money for which she had sold her cargo, and which she would now have on board, would be much more esteemed by us than the cargo itself. Thus we were a second time engaged in an eager expectation of meeting with this Manilla ship, which, by the fame of its wealth, we had been taught to consider as the most desirable capture that was to be made on any part of the ocean.

As it was the 19th of February when the barge returned, and brought us our intelligence, and the galleon was not to sail till the 3d of March, the Commodore resolved to continue the greatest part of the intermediate time in his present station to the westward of Acapulco, in order to avoid a discovery from the shore. During this interval we were employed in getting all things in readiness to engage; and, when the long-wished-for 3d of March came, we were all so strongly prepossessed with the certainty of our intelligence, and with an assurance of her coming out of port, that some or other

of us were constantly imagining that they discovered one of our cutters returning with a signal; but, to our extreme vexation, both this day and the succeeding night passed away without any news of her approach. However, we did not yet despair, nor did we abate of our vigilance: but, after remaining till the 25th of March, we at length concluded, and we afterwards found it to be true, that we had been discovered, and that in consequence an embargo had been laid upon the galleon, and her departure postponed till the next year.

The cutters, having on that day finished their cruise before the harbour, returned to the Squadron, and the signal being given for the fleet to join, it was determined to retire to Chequetan, to take in a fresh supply of water, which was then nearly exhausted. In the mean time, a cutter, commanded by Mr. Hughes, Lieutenant of the Trial's prize, was ordered to continue off the harbour of Acapulco for 24 days, in order that, if the galleon should set sail in that time, we might be speedily informed of it.

On the 5th of April we entered the harbour of Chequetan, in latitude 17 deg. 36 min. N. about 30 leagues to the westward of Acapulco. The watering-place has the appearance of a large standing lake, without any visible outlet into the sea, from which it is separated by a part of the strand. The origin of this lake is a spring that bubbles out of the ground, near half a mile within the country. We found its water a little brackish, but not considerably so towards the sea-side; for the nearer we advanced towards the spring-head, the softer and fresher it proved. This laid us under a necessity of filling all our casks from the farthest part of the lake, which was facilitated by means of canoes which traversed the lake, and brought a number of small casks to the side next the beach; thence the water was started into larger vessels in the boats, and by that contrivance brought on board with very little trouble.

As the country hereabouts, particularly the tract of coast contiguous to Acapulco, appeared to be well peopled and cultivated, we hoped to have easily procured from thence some fresh provisions, and other refreshments, which we now stood much in need of. To facilitate these views, the Commodore, the morning after we came to an anchor, ordered a party of 40 men well armed to march into the country, and to endeavour to discover some town where they were to attempt to set on foot a correspondence with the inhabitants; for, when we had once begun this intercourse, we doubted not but by proper presents we should allure them to bring down to us whatever fruits or fresh provisions were in their power. As our prizes abounded with various sorts of coarse merchandize, which were of little consequence to us, though to them they would be extremely valuable, our people were directed on this occasion to proceed with the greatest circumspection, and to make as little ostentation of hostility as possible; for we were sensible we could find no wealth in those parts worth our notice; and what necessities we really wanted, we expected would be better, and more abundantly supplied, by an open amicable traffic, than by violence and force of arms. But this endeavour of opening a commerce with the inhabitants proved ineffectual, and therefore we desisted from any more attempts of the same nature, contenting ourselves with what we could procure for ourselves in the neighbourhood of the port where we lay. We caught fish in abundance; among the rest cavallies, breani, mullets, soals, fiddle-fish, and lobsters; and we here, and in no other place, met with that extraordinary fish called the torpedo, which is in shape very much resembling the fiddle-fish, and is only distinguished from it in appearance by a brown circular spot of about the bigness of a crown-piece, near the center of its back. This fish is, indeed, of a most singular nature, benumbing whoever touches it all over his body, but more particularly that limb which happens to come in immediate contact with it. The same effect, too, will be in some degree produced by touching the fish with any thing held in

the hand; and it has lately been discovered, that it may be communicated like the electrical shock to a large circle, by means of a certain apparatus much more simple than that which is used in experiments in electricity.

The animals which we met with on shore were chiefly guanoes, with which the country abounds, and which are by some reckoned delicious food. We saw no beasts of prey, except we should esteem that amphibious creature the alligator as such, several of which our people discovered, but none of them very large. It is, however, certain, that there were great numbers of tygers in the woods, though none of them happened to make their appearance while we remained upon the coast. Parrots and pheasants were found in plenty, but by no means proper for food, being dry and tasteless, though they were often killed and eaten, being by some thought preferable to salt provisions.

The papah, lime, and a little four plumb, were all the fruits the woods furnished, and of these there were but a scanty portion; nor was there any other useful vegetable, except brook-lime, which, being esteemed an antiscorbutic, was frequently eaten, though from its bitterness it was exceedingly unpalatable.

While we lay at Chequetan, it was resolved, after mature deliberation, to destroy all our prizes, as the whole number of men on board our Squadron did not amount to the complement of a fourth-rate man-of-war. It was therefore judged most prudent to set fire to the ships, and to divide the men between the Centurion and Gloucester, now preparing to set sail for China. Besides the necessary repairs for a voyage of such length, the removal of their stores and cargoes into the men-of-war took up so much time, that it was the end of April before we were in a condition to leave the place.

It should have been remarked, that, from this harbour of Chequetan we discovered but one pathway through the woods into the country; and as this was much beaten, we were from that circumstance convinced, that it was not unfrequented by the natives. As it passed by the spring-head, and was the only avenue by which the Spaniards could approach to surprise us, we at some distance beyond the spring-head felled several large trees, and laid them one upon another across the path, and at this barricadoe we constantly kept a guard. We, besides, ordered our men employed in watering, to have their arms always in readiness, in case of an alarm, and to march instantly to this post. And, though our principal intention herein was to prevent our being disturbed by the enemy's horse, yet it answered another purpose, which was, to hinder our people from straggling singly into the country, where we had reason to believe they would be surprised by the Spaniards, who would doubtless be very solicitous to pick up some of them, in hopes of getting intelligence of our future designs. To avoid this inconvenience, the strictest orders were given to the centinels, to let no person whatever pass beyond this post; but, notwithstanding this precaution, we missed one Lewis Legere, who was the Commodore's cook. As he was a Frenchman and a Roman Catholic, it was at first imagined that he had deserted with a view of betraying all that he knew to the enemy; though this appeared, by the event, to be an ill-grounded surmise; for it was afterwards known, that he had been taken by some Indians, who carried him prisoner to Acapulco, from whence he was transported to Mexico, and thence to Vera Cruz, where he was shipped on board a vessel bound to Old Spain. But, the vessel being obliged, by some accident, to put into Lisbon, Legere escaped on shore, and was by the British Consul sent from thence to England; where he gave the first authentic account of the safety of the Commodore, and of his principal transactions in the South Seas.

The relation he gave of his own seizure, was, that he rambled into the woods, at some distance from the barricadoe where he had first attempted to pass, but had been stoppt and threatened to be punished; that his principal

principal view was to gather a quantity of limes for his master's stores; and that in this occupation he was surprised unawares by four Indians, who stript him naked, and carried him in that condition to Acapulco, exposed to the scorching heat of the sun, which at that time of the year shone with its greatest violence; that afterwards, at Mexico, his treatment was sufficiently severe; so that the whole course of his captivity was a continued instance of the hatred which the Spaniards bear to all those who endeavour to disturb them in the peaceable possession of the coasts of the South Seas. Indeed, Legere's fortune was, upon the whole, extremely singular; as, after the hazards he had run in the Commodore's Squadron, and the severities he had suffered in his long confinement among the enemy, a more fatal disaster attended him on his return to England; for though, when he arrived in London, some of Mr. Anson's friends interested themselves in relieving him from the poverty to which his captivity had reduced him, yet he did not long enjoy the benefit of their humanity, since he was killed in an insignificant night-brawl, the cause of which could scarcely ever be discovered.

When we were necessitated to proceed to Chequetan to recruit our water, the Commodore considered that our arrival in that harbour would soon be known at Acapulco; and therefore he hoped, that on the intelligence of our being employed in that port, the galleon might put to sea, especially as Chequetan is so very remote from the course generally steered by the galleons: he therefore ordered the cutter, as has already been noticed, to cruise 24 days off the port of Acapulco, and her commander was directed, on perceiving the galleon under sail, to make the best of his way to the Commodore at Chequetan. As the Centurion was certainly a much better sailer than the galleon, Mr. Anson, in this case, resolved to have got to sea as soon as possible, and to have pursued the galleon across the Pacific Ocean; however, the Viceroy of Mexico ruined this project, by detaining the galleon in port all the year.

Towards the latter end of April, all things being in readiness for sailing, the Centurion and Gloucester weighed anchor; and, after having gained an offing, the prizes were set on fire, and a canoe fixed to a grapple in the middle of the harbour, with a bottle in it, well corked, inclosing a letter to Mr. Hughes, directing him to go back immediately to his former station before Acapulco, where he would find Mr. Anson, who resolved to cruise for him in that station some days. Indeed, it was no small mortification to us, now we were at sea, and the stormy season approaching, that we were detained by the absence of the cutter, and under a necessity of standing towards Acapulco in search of her. As the time of her cruise had been expired near a fortnight, we suspected that she had been discovered from the shore, and that the Governor of Acapulco had thereupon sent out a force to seize her; which, as she carried but six hands, was no very difficult enterprise. However, this being only conjecture, the Commodore, as soon as he was got clear of the harbour of Chequetan, stood along the coast to the eastward in search of her; and, to prevent her from passing by us in the dark, we brought to every night, and carried lights which the cutter could not but perceive.

By the 2nd of May we were advanced within three leagues of Acapulco; and having seen nothing of our boat, we gave her over for lost; which, besides the compassionate concern for our shipmates, and for what it was apprehended they might have suffered, was in itself a misfortune, which in our present scarcity of hands we were greatly interested in; since the crew of the cutter were the flower of our people, purposely picked out for this service, as known to be, every one of them, of tried and approved resolution, and as skilful seamen as ever trod a deck. However, as it was the general belief among us that they were taken and carried into Acapulco, the Commodore's prudence suggested a project which we hoped would recover

them. This was founded on our having many Spanish and Indian prisoners on board, some of them of quality. The Commodore, therefore, wrote a letter to the Governor of Acapulco, telling him, that he would release them all, provided the Governor returned the cutter's crew. This letter was dispatched by a Spanish officer, of whose honour we had a high opinion, and who was furnished with a launch belonging to one of our prizes, and a crew of Spaniards, who gave their parole for their return. The Spanish officer, too, besides the Commodore's letter, carried with him a joint petition, signed by all the rest of the prisoners, beseeching the Governor to acquiesce in the terms proposed for their liberty. But while we were thus contriving their release, the centinel called out from the mast-head, that he saw a boat under sail at a considerable distance to the south-eastward, which, to our unspeakable joy, upon her nearer approach, we found was our own cutter, the wan and meagre countenances of whose crew, the length of their beards, and the feeble and hollow tone of their voices, convinced us that they had suffered much greater hardships than could be expected from even the severities of a Spanish prison. They were obliged to be helped into the ship, and were immediately put to bed; where, by rest, and nourishing diet, with which they were plentifully supplied from the Commodore's table, they recovered their health and vigour. And now we learnt that they had kept the sea the whole time of their absence, which was above six weeks; that, when they had finished their cruise, and had just begun to ply to the westward, in order to join the squadron, a strong adverse current had forced them upwards of 80 leagues to leeward, where they found every where so great a surf, that there was no possibility of landing; that they passed some days in the most dreadful situation, without water, having no other means left them to allay their thirst than sucking the blood of the turtles which they caught; that at last, giving up all hopes of succour, the heat of the climate too augmenting their necessities, and rendering their sufferings insupportable, they abandoned themselves to despair, fully persuaded that they should perish by the most terrible of all deaths; but that soon after a most unexpected incident happily relieved them; for there fell so heavy a rain, that, on spreading their sails horizontally, and putting bullets in the centers of them, they caught as much water as filled their casks; that immediately upon this fortunate supply, they stood to the westward in quest of the Commodore, and being now luckily favoured by a strong current, they joined him in less than 50 hours from that time, after having been absent in the whole full 43 days.

And now having, to our entire satisfaction, got on board our people, and the season of the year for sailing to Asia being far (we found it too far) advanced, the Commodore resolved not to wait for any return from Acapulco, but gave orders to equip two large prize launches, to carry on shore the Spanish and Indian prisoners, both from ourselves and the Gloucester; and, having given them provisions and all necessaries for Panama, whither they intended to sail, about four in the evening they left us, to the number of about 60 persons, having first, though enemies, observed the custom of seafaring people at parting, and wished us a prosperous voyage.

From the 6th of May, the day we took our departure, we met with little remarkable for above a month, except that the true trade-wind, which is said never to fail at about 60 or 70 leagues from the shore of Mexico at the farthest, was so far from answering our expectations, that we had nothing but cross winds, squalls, rain, thunder, and lightning, till by account we were 600 leagues to the westward of Acapulco, having been above 40 days in getting so far. The 9th, we found the foremast sprung in a dangerous manner, and thereupon fished and secured it very strongly.

The 22nd, in the evening, we sprung a leak, making 12 inches water in a watch, and on a search found it

to be on the larboard side, abreast the main hatch-way, and not quite under water. The carpenters soon stopt it with very little trouble.

The 11th of June, we found a current to set to the southward, about 24 miles a day, but could not discover whether to the east or west, for want of opportunity to try it. This was by account about 450 leagues from Acapulco; and, much about this time, abundance of scorbutic symptoms, such as blackness in the skin, hard nodes in the flesh, shortness of breath, and a general lassitude and weakness of all the parts, began to prevail, almost universally, among our people. This with the great mortality we experienced from this distemper in our Cape Horn passage, and the time we might still expect to be at sea, having yet 1800 leagues to those islands called, by Sir Francis Drake, the Ladrões, or Islands of Thieves, from the thievish disposition of the inhabitants, but by the Spaniards the Marian Islands, where only we could expect our next refreshments; and no trade-wind being yet settled; these considerations, I say, gave us dreadful apprehensions of what this passage might terminate in; and the event shewed that we had but too much reason for them.

The 14th, at five in the evening, the Gloucester, having sprung the head of her main-mast, 12 feet below the trussel-trees, fired a gun as a signal of distress; on which we brought to, and waited for her; and, after enquiring into, and hearing the cause, we sent them on board two carpenters to assist in fithing and securing it; but the carpenters in concert, having viewed and considered the damage, reported, the next day, that the mast was unfit to stand, and would not bear repairing; but that it must be shortened 26 feet from the head, and the top-mast be set on the stump. This, therefore, was concluded on, and ordered accordingly.

The 23rd, we found our own main-top-mast sprung in the wake of the cape; whereupon, we reefed it 20 inches, that is, we lowered it so much, and secured it there, and fletted and set up the shrouds and back-stays.

The 24th, in the evening, we got the top-mast down, and put up another in its place, and a man falling overboard, we brought the ship to, and took him up safe; likewise, the slings of our cross-jack-yards being broke, we fixed new ones, and the next day got up the fore-top-gallant-mast and yard.

The 27th, we made the Gloucester signal and sent our boat on board of her.

The 28th, we received from the Gloucester half an anchor-stock, for a farther security to the fore-mast.

The 29th, the Gloucester finished her jury-mast, and made sail on it. Nothing farther remarkable till July 1st, we had fresh gales, and cloudy weather, with some lightning.

The 2nd, we unbent the fore-sail, and bent another. We had, not only now, but for almost our whole passage, abundance of birds of prey, also flying fish, which are their proper food, and vast quantities of skip-jacks, albicores, &c. whereof we took a great number, which contributed much to our refreshment after the loss of the tortoises, that generally leave all ships about 20 or 30 leagues off the land. I think this the more worthy of notice, because Dampier, Rogers, Cook, Cowley, and most other voyagers, some of whom have been not only once, but several times on this voyage, have reported, that they never saw a fish or fowl in this whole run. For my part, I readily believe and conclude, that this difference in our observations and accounts is really occasioned by the different seasons of the year in which we happened to perform this passage; it being a known truth, and confirmed by the experience of thousands in all ages, that most fish have their different seasons for their different rendezvous.

The 10th, we saw three gannets, or, as they call them in Scotland, soland geese; being, by what I can learn from the most intelligent of that nation whom I have conversed with, and who often have opportunity to observe them in several different parts, of one and the

same species; we likewise saw some sea weeds; both which circumstances made us imagine that some islands or shoals were not far off, those fowls never being observed to fly very far out to sea.

The 11th, we unbent the fore-top-sail, and bent another.

The 12th, at noon, we were, by my account, 180 deg. 11 min. to the westward of the meridian of London, which is just 11 min. more than half round the globe, for which reason I note it. We were at this time, by my account, 1429 leagues distant from the port of Acapulco.

From this time till the 16th, we had fresh gales, with squalls and rain.

The 17th and 18th, we had moderate and cloudy weather.

The 19th and 20th, fresh gales, with abundance of rain. We made this observation, that, with rainy weather, or even slight transient showers, the fish bit more freely, and were caught in greater numbers, than with fair weather; which made our fishermen the more attentive at such times. It was likewise remarked, that the Gloucester, when they could find opportunity to fish, had always much greater success than we; whether their fishermen had more art than ours, or whatever else occasioned it, the fact is true. They had also a better way of disposing of them, when taken, if I may be allowed to judge, than we; for Captain Mitchell constantly ordered several boys, who were very dexterous at it, to catch fish for the ship's company, especially the sick; and those were very justly and regularly divided among them: whereas our fishermen were left at liberty to make their advantage of what they took, and to prey upon their suffering shipmates; and they took care not to overslip the opportunity, for the least fish you could purchase of them would cost you a bottle of brandy; which, at this time, was worth four, or perhaps, six and sometimes even eight shillings, or half a guinea; and you must be very thankful, and acknowledge yourself to be highly obliged into the bargain, or else expect none next time, and very often fail of it notwithstanding. About this time our people began to die very fast, and, I believe, above five parts out of six of the ship's company were ill, and expected to follow in a short time. Those, whose breath was any ways affected, dropt off immediately; but those, who were attacked first in the more remote parts of the body, languished generally a month or six weeks; the distemper advancing, in the mean time, towards the lungs, by a very regular and sensible approach. As I was myself one of those who were severely afflicted in this latter manner, I shall give such an account of its progress, as I found by experience in myself, and corroborated by the similar report of my fellow-sufferers. I was first taken, about the beginning of this month, with a slight pain on the joint of my left great toe; but, having hurt that a little while before, I imagined it to be the effect of that hurt, and minded it the less—(but here I shall observe, once for all, that if ever any part of the body had received a bruise, strain, or contusion, if not perfectly cured, the scurvy was sure to attack that part first;) but, in a little time, a large black spot appearing on the part affected, with very intense pains at the bone, gave me to understand my case. I now took physic often, by way of prevention, but to little purpose: several hard nodes now began to rise in my legs, thighs, and arms, and not only many more black spots appeared in the skin, but those spread, till my legs and thighs were for the most part as black as a negroe; and this accompanied with such excessive pains in the joints of the knees, ancles, and toes, as I thought, before I experienced them, that human nature could never have supported. It next advanced to the mouth; all my teeth were presently loose, and my gums, over-charged with extravasated blood, fell down almost quite over my teeth: this occasioned my breath to smell much, yet without affecting my lungs; but, I believe, one week more at sea would have ended me, and less than a month more, all the rest. One thing was very remarkable

markable, and likewise universal, which was, that, when the distemper had far prevailed, if the afflicted person lay quiet in his hammock, he seemed to be perfectly well and hearty; but, if he was removed out of it, on any necessity, he immediately fainted away; and this was always a sure sign of the party's dissolution.

Since our passing Cape Horn, our surgeon, Henry Ettrick, who was a very good practical surgeon, had been very busy in digesting a theory of scurvies, wherein he enumerated many cases very particularly, having been allowed to open and examine as many bodies as were abundantly sufficient for that purpose. His system was principally grounded on the observations made on a long passage in a very cold climate. He took abundance of pains to prove, by many instances, that the tone of the blood was broken by the cold nipping air, and rendered so thin, as to be unfit for circulation, or any other of the uses of life; and being thus deprived of a proper force and vigour, stagnation and death must necessarily ensue. From this supposition, he had laid it down as an infallible rule, that food of a glutinous nature, such as salt fish, bread, and several sorts of grain, were alone proper on such voyages. As for liquids, I know not which he had pitched on, as the most salutary, on this occasion. But this passage, in a very hot climate, here the symptoms were not only more dreadful, but the mortality much more quick and fatal, in proportion to the number of people, put our scheming doctor to a sad non-plus; he could not account for this on the same principles with the other; nay, they must be, in a manner, diametrically opposite. All this obliged him at last (though he was still endeavouring to reconcile contradictions), to own, that, though some of the concurrent causes of this disease were plain enough, yet the grand cause was certainly the long continuance at sea, or an entire secret; and that no cure but the shore would ever be effectual. The Commodore, on this great mortality, having by him a quantity of Ward's pills and drops, in order to experience whether they would be of any use, first tried them on himself, and then gave what he had left to the surgeon, to administer to such of the sick people as were willing to take them. The surgeon would not recommend them to any person, but several took them; though I know of none who believed they were of any service to them. They worked most people who took them very violently, both by vomit and stool: after which, as several told me, they would seem to be a little easier, though weaker, for perhaps a day or two, but then they always relapsed, and became worse than before; and this, together with the inefficacy of all that our surgeons could do in the case sufficiently shewed the vanity of attempting the cure of this distemper at sea.

And here, before I quit this subject, I shall endeavour to remove a prejudice, under which the afflicted have long severely suffered; and that is, from the notion generally prevalent, that none but the lazy are attacked with this disorder; whereas, the direct contrary is the truth; our experience having abundantly shewn, that the most laborious, active, stirring persons were oftentimes seized with this disease; and the continuation of their labour, instead of curing, only helped to kill them the sooner.

Many undemable instances might be given of this in our voyage; and, if future voyagers will give themselves the trouble of observing this hereafter, I am certain that the event will correspond with my assertion; nor does this distemper, in a general way, incline people to indolence, till it is come to that height, that, at the least motion, the person is ready to faint. It is certain, that, if the person afflicted desires to lengthen out his life as long as he can, his best way is to stir as little as possible. This I have seen verified by many instances.

The 23rd and 24th, we reefed and repaired our rigging, which had suffered much in the variable weather.

No. 43:

The 26th, being, according to our reckoning, 300 leagues from the Ladrões, we met with a westerly wind, which did not come about again in four days. This was a most dispiriting incident, as we were all that while forced to lie to, the current insensibly driving us out of our course.

The 27th, our gunner, Henry Kipps, died of the scurvy, being one of the most able-bodied men, as well as the most active in the ship: he had taken Ward's medicines once or twice.

On the 28th, we had calms with much rain, and received from the Gloucester 20 casks of flour, and four of groats. Having here an occasion of mentioning flour, it may not be amiss to take notice, that, since our departure from Juan Fernandez, the principal officers had always soft bread new baked, the biscuit being so much worm eaten, it was scarce any thing but dust, and a little blow would reduce it to that state immediately. Our beef and pork were likewise very rusty and rotten; and the surgeon endeavoured to persuade us from eating it, alledging it was, though a slow, yet a sure poison; but very little other food being to be had, we were reduced to a very deplorable condition.

The 29th, in the morning, the Gloucester's fore-cap splitting, her fore-top-mast came by the board, and, in its fall, meeting with the fore yard, broke it in the flings. As she was hereby rendered incapable of making any sail for some time, we were under a necessity, as soon as a gale sprung up, to take her in tow, and near 20 of the healthiest and ablest of our seamen were removed from the duty of our own ship, and were continued eight or ten days together to assist in repairing her damages; but these things, mortifying as we thought them, were only the commencement of our misfortunes; for, scarce had our people finished their business in the Gloucester before we met with a most violent storm from the western board, which obliged us to lie to. This storm lasted from the 10th to the 13th of August, attended with rain, thunder, and lightning, and such a lofty and dangerous sea, as I have seldom seen, and could not have believed in latitudes between the Tropics, especially for such a long duration. Most of the time we lay to, we drove to the northward; abundance of our people died daily; and, the ship proving very leaky, every person who could stir, the principal officers not excepted, was obliged to take his turn at the pumps, and all little enough to keep us above water.

The 13th of August, at ten in the morning, the Gloucester made a signal of distress, and, being to windward, bore down towards us; but we observed she was long in wearing, rolled very much, and made bad steerage. About half an hour after noon they spoke with us, and told us that they were so leaky that they must quit their ship; that they had seven feet water in the hold; and that all the men they had capable of stirring were quite exhausted with pumping, and could work no longer. This was an additional misfortune, and seemed to be without resource: for, whilst the Gloucester's crew were thus enfeebled, our own sick were now so much increased, and those who still remained in health so over fatigued with labour, that it was impossible for us to lend them any aid: all, therefore, that could be done was to send our boat on board for a more particular account of the ship's condition; as it was soon suspected, that the taking her people on board us, and then destroying the Gloucester, was the only measure that could be prosecuted in the present emergency both for the preservation of their lives and of our own.

Our boat soon returned with a representation of the melancholy state of the Gloucester, and of her several defects, signed by Captain Mitchell and all his officers; by which it appeared, that the ship was decayed in every part; that her crew was greatly reduced; that there remained alive no more than 77 men, officers included, 18 boys, and two prisoners; that of the whole number, only 16 men and 11 boys were capable of keeping the deck, and several of these very infirm; that

the water was so deep in the hold, that those who were yet alive were starving, and could neither come at fresh water nor provisions.

From this representation, which was in no one instance exaggerated, the Commodore sent immediately an order to Captain Mitchell, to bring his people on board the *Centurion*, and to take out such stores as could most easily be come at, among which he was very desirous of saving two cables, and a steel-anchor; but the ship rolled so much, and the men were so excellently fatigued, that it was with the greatest difficulty the prize-money was secured (the prize-goods amounting to many thousand pounds being abandoned): nor could any more provisions be got at, than five casks of flour (three of which were spoiled by the salt-water), a small quantity of brandy, and some living stock. Even this little business was so languishingly performed, that two days were wasted in the execution, during which time three or four of the sick perished on being moved.

As the weather was now calm, and we were uncertain how far distant we might be from Guam, a settlement in possession of the enemy, to whom the wreck of such a ship with guns and ammunition on board would have been a very valuable acquisition, the Commodore judged the most effectual way to prevent her from falling into their hands was to set her on fire: and accordingly, as soon as the Captain and his Officers had quitted her, the combustibles placed for that purpose were lighted, and she continued burning the whole night, and at six the next morning she blew up. Thus perished his Majesty's ship the *Gloucester*; and now, it might have been expected, that, being freed from the embarrassment in which her frequent disasters had involved us, we should have proceeded on our way much brisker than we had hitherto done. However, we were soon taught, that our troubles were not yet to be relieved.

We were at this time in the utmost distress, the ship considerably lumbered with prize-goods, and the little room we had left thronged with the sick, whose numbers were now very much increased by those from the *Gloucester*; the dirt, nauseousness, and stench, almost every where intolerable; more people daily disabled with the disease; no sign of land, nor but very little wind, and that not fair but variable; very bad provisions and water, and the ship very leaky; and, though we discovered the leak to be in her bows on each side the stern, it lay in such a manner that we could not stop it, nay, the attempting to do it rather made it worse. In this distress we made the best of every little spurt of wind.

Nothing farther remarkable happened till Sunday the 22d, when, about eight in the evening, we discovered two islands, one bearing W. half S. and the other S. W. by W. at the distance of about 10 leagues. We were overjoyed at this sight, and stood toward them with all our sail; but, there being little wind, we did not get near them till the next day about noon, when being about three miles off the largest and most promising of them, which appeared very hilly and full of trees, we sent on shore one of our Lieutenants in the cutter to make discoveries, who returned at nine in the evening, and gave us but a very indifferent account of the land. The trees were mostly cocoa-nut-trees, of which there were prodigious quantities (about 60 cocoa-nuts they brought on board with them); but they could find no water, nor any good place to anchor in: on this account it was thought fit to stand further to the southward, for some more proper place. This was a severe disappointment to most of the sick, who, on the sight of land, (on hearing that we were so near it) had begun sensibly to revive: but as persons in such circumstances are soon driven to despond when an aid they had depended upon deserts them, so this disappointment marred our hopes, and increased our dejection. We feared, that, if we met with more islands in the same run, they might be either as bad, worse, or inhabited by our enemies the Spaniards, who, in our weak condition, might easily be able to hinder us from proper refreshments: add to this, how near many of us were to death, and how little we could expect to survive while in

search of other islands. I know not whether these were the general thoughts of the sick, but I must own they were mine, and made our situation at that time appear infinitely worse to me than at any other in the whole course of our voyage. I was indeed very ill, and my illness might possibly occasion every thing to appear in its worst light, yet I never was one of those who were frightened at the apprehension, or even the visible approach of death; it had no unreasonable terrors in any of its prospects to me; and I always could, and I hope always shall be ready to meet it with calmness and perfect resignation: but I believe the healthiest and stoutest at that time had probably the greatest apprehensions; and I have since heard it from many of those, that they expected all to have perished, had we been so little as three weeks longer at sea; and I much question whether they were not right in that imagination.

On the 26th, at five in the morning, we saw three other islands, bearing from S. E. by S. to N. E. the middlemost of the three, which was the largest, due E.

The 27th, at three in the afternoon, being got pretty near the shore of the middlemost island, we sent our cutter and pinnace in shore for discovery. At four the pinnace came off, and brought with her an Indian paroo, with a Spaniard and four Indians, whom they took in her. They likewise told us, that they had in-shore a small bark of about 16 tons, and between 20 and 30 more people on the island, all of whom had been sent there from Guam to kill cattle and hogs, and make jerked beef, and cocoa-nut-oil, &c. for the Spanish garrison there; and that there are constantly people sent on that account, who, after some months stay at that place, are relieved by fresh parties for the same purpose. We secured both bark and paroo, together with all the Indians who fell into our hands, to hinder their carrying intelligence of us to the Spaniards at Guam. One of those Indians was a carpenter by trade, and his father was one of the principal builders at Manilla. This young man, having been ill used by the Governor at Guam, voluntarily entered with us, and became one of our carpenter's crew, and proved a very useful handy fellow.

The Spaniard being examined as to the state of the island we were now approaching, the account he gave surprised even our most sanguine hopes; and, though uninhabited, he said, it wanted none of those accommodations with which the best cultivated countries are furnished. On mustering up our whole force, as we drew near, all the hands we could collect capable of any kind of duty, even on the most pressing occasions, amounted to no more than 71 men, officers included. This number, inconsiderable as it may seem, were all of the united crews of the *Centurion*, *Gloucester*, and *Trial*, that could move without being assisted, notwithstanding that, when we left England, they consisted of near 1000 men.

When we had entered the road, our first business, after furling the sails and securing the ship, was to provide an hospital on shore for the sick; but the officer and seamen who were sent upon this service, returned joyfully, and acquainted us, that the Indians on shore had saved them that trouble, and had provided for us better than we could have done for ourselves; for, having erected a number of little cabbins for their accommodation during their residence on the island, and one in particular, which they made use of by way of storehouse to stow their provisions in, there could be nothing more suitably adapted for the reception both of the sick and the healthy than these erections. Accordingly, we instantly began sending ashore as many of the sick as could possibly be conveyed, among which number I myself was one; I say, as many as could possibly be conveyed; for we were all so extremely feeble and helpless, that we were no otherwise to be landed than by being carried in our hammocks, both in and out of the boats, on mens shoulders, in which service both the Commodore himself and his officers very humanely assisted; and, indeed, they were almost the only persons on board capable of performing it; the healthiest seamen being so much enfeebled, that they

they had but just strength enough left to help themselves.

The next day, being the 29th, the remainder of the sick were brought on shore, of whom 21 soon died; but the greatest part of the rest recovered surprizingly. As soon as I was capable of stirring about, I found the island to lie in latitude 14 deg. 58 min. N. [Walter says 15 deg. 8 min.] and in longitude 223 deg. 35 min. W. from London, being, according to my reckoning, 117 deg. 7 min. W. from Acapulco. [Walter says 114 deg. 50 min.] And here it is observable, how writers of the first characters for veracity differ in their accounts of the same places, by visiting them at different periods. The description of this island of Tinian by Commodore Byron, who lately visited it in his voyage round the world, bears no similitude to that we are now about to recite; nor can any one conceive how an interval of only 30 years could occasion so remarkable an alteration in an island that had lain uncultivated for many centuries before. But to proceed:]

The soil, upon examination, we found to be every where dry and healthy; and being withal somewhat sandy, it was thereby the less disposed to a rank and over-luxuriant vegetation: and hence the meadows and woods were nearer and smoother than is usual in hot climates. The vallies and hills were most beautifully diversified by the mutual encroachments of woods and lawns, which skirted each other, and traversed the island in large tracts. The woods consisted of tall and well-spread trees, some celebrated for their beauty, and some for their fruit; whilst the lawns were generally crowded with herds of cattle, of which it was not uncommon to see thousands feeding in a herd, and, being all milk-white, it is no wonder that such an appearance excited our longings, and increased our impatience, to kill and eat. Add to these, the innumerable swarms of poultry that crowded the woods, and, by their frequent crowings, gave us in idea the pleasing apprehension of being in the neighbourhood of farms and villages; and we even fancied, that in the covert of the woods we should find such concealed. The cattle we had sight of were computed at 10,000; and, besides these and the poultry, we likewise found abundance of wild hogs, which were excellent food, but fierce, and not easily mastered. At first we killed them by shooting; but, our ammunition failing, owing to an incident, we at last hunted them down with dogs, several of which joined us on the island, and, being trained to the sport by the Indians, readily enough followed us, and afforded us good diversion. In their conflicts with the bears, some indeed were killed; but those that came off victorious, were still more eager to engage in every new pursuit.

This island was no less fortunate to us in its vegetable than its animal productions; more particularly abounding in such fruits and plants as were best adapted to the cure of that disease by which we had been so dreadfully debilitated. In the woods cocoa nuts were to be gathered without number; and, what is remarkable, cabbages grew on the same trees. There were, besides, guavas, limes, sweet and sour oranges, and, what is common to all the Tropical islands, bread-fruit. In the plains we found water-melons, dandelion, creeping-purslain, mint, scurvy-grass, and forrel; all which, together with the fresh-meats of the place, were such salutary refreshments, that the sick, who were at death's-door when they landed, before they had been a week on shore, put on very different countenances, and with their new complexions received a fresh recruit of spirits.

Amidst such a variety of provisions as the land furnished, it was thought unnecessary to indulge ourselves in those offered us by the sea. From fish, therefore, we wholly refrained; and the rather, as some we caught at our first arrival surfeited those who eat of them. This, however, was not regretted, as beef, pork, poultry, and wild-fowl, were in such plenty, that, except the trouble of bringing them from a considerable distance sometimes, there was no difficulty attending their pro-

curement. It were, indeed, an endless task to recount all the excellencies and delicacies we met with in this delightful island: nor is it easy to say which to prefer where every thing is worthy of admiration; the neatness of its lawns, the flatness, freshness, and fragrance of its woods, the happy inequality of its surface, and the variety and elegance of the views it afforded,—all these conspired to charm the sight, while at the same time the excellency of its productions could not fail to gratify the appetite. And these advantages were greatly enhanced by the healthiness of the climate, by the almost constant cool breezes that prevailed, and by the frequent gentle showers that seemed to fall just to refresh the earth, and add to its fertility; for these, instead of the long-continued rains that in other countries fill the air with noxious vapours, and overflow the earth with wasteful inundations, seemed just enough to purify the air, and to refresh the soil; which was observable enough by the effect it had in increasing our appetites, and promoting our digestion. This effect was, indeed, remarkable, since those amongst our officers, who were at all other times spare and temperate eaters, were here in appearance transformed into gluttons; for instead of one reasonable flesh-meal a day, they were scarcely satisfied with three: and yet our digestion so well corresponded to the keenness of our appetites, that we were neither disordered nor even loaded by this uncommon repletion; for, after having made a large beef breakfast, it was not long before we began to consider the approach of dinner as a very desirable, and even somewhat tardy event.

The principal inconveniences that attended our residence upon this island arose from the vast number of musketos and other troublesome flies, by which we were perpetually teased; there was likewise a venomous little insect, that, like the sheep-ticks in England, would bury its head in the skin, and, if not instantly removed, would cause an inflammation.

Running water there was none in the island; but that defect was supplied by a large lake, or lagoon, almost in the center of it, to which the cattle, in times of drought, generally resorted; but the freshness of their pasture, and the copious dews and gentle showers that often moistened it, rendered that resource almost unnecessary. There were, besides, springs of excellent water, and near the surface wells might every where be dug, whose waters, in any other place would not have been complained of.

But the great danger we had to dread remains to be told. During four months in the year, that is, from the middle of June to the middle of October, when the western monsoons prevail, the winds, about the full and change of the moon, are variable, and blow with such fury, that the stoutest cables afford no security to ships riding at anchor in the road: and what adds to the danger is the rapidity of the tide, which sets to the S. E. and occasions such a hollow and over-grown sea as is not to be conceived; inasmuch that, though we were in a sixty-gun ship, we were under the dreadful apprehension of being pooped by it. During the rest of the year the weather is constantly settled, and ships have nothing to fear, if their cables are well armed, which otherwise will suffer from the foulness of the ground.

From the 29th of August, when our sick were all put on shore, on the 12th of September, when the Commodore himself landed, those who remained on board were chiefly employed in mooring and securing the ship, in shifting her guns to come at her leaks, and in cackling the cables, to prevent their being galled by the friction against the rocky bottom. At the same time an anchor and cable were put on board the Spanish bark, her own being only a heavy log of wood, and a rope made of bafs; and some barrels of powder to be dried and recovered, which by long keeping was become moist.

From the 12th to the 18th, the hands were continually shifting, those who were so well recovered as to be capable of duty were sent on board, and those who had

had born the burden of the labour were relieved and sent on shore.

On the 19th, the weather began to alter, and to threaten a storm: on that day, the next, and the 21st, it blew hard; however, we rode it out, and flattered ourselves that the prudence of our measures had secured us from accidents. On the 22d, the hurricane came on, and our only hope of safety seemed to depend on our putting out to sea; but the Commodore was on shore, and all communication with the land absolutely cut off. At five in the afternoon, the small bower parted, and the ship sprung off to the best bower. As night approached, the violence of the storm increased; yet, notwithstanding its inexpressible fury, the rapidity of the tide was such as to prevail over it, and to force the ship before it, as it were, in despite of its utmost rage. It was now that the sea broke all round us in a most tremendous manner; and that a large tumbling swell threatened to engulf us in its bosom: the long-boat, which was moored a-stern, was on a sudden canted so high that it broke the transom of the Commodore's gallery, and would, doubtless, have risen as high as the taffarel, had it not been for the stroke, which stove the boat to pieces; but yet the poor boat-keeper, though much bruised, was saved almost by miracle. About eight, the tide slackened; but, the wind not abating, the best bower cable, by which alone we rode, parted at eleven. In this extremity, Mr. Saumarez, our first lieutenant, who commanded in the absence of the Commodore, ordered guns to be fired, and lights to be shewn, as signals of distress; and, in a short time after, the night being excessively dark, the storm raging, the thunder roaring, and nothing to be seen but the blue lightning flashing through the rain, we were driven to sea, and by this catastrophe, the whole crew, both by sea and land, reduced to a state of despair; those on shore concluding they had now no means left them ever to get home; whilst those on board, being utterly unprepared to struggle with the fury of such seas and winds, expected each moment to be their last. In this state of despondency, while those on board were every moment in expectation of being dashed against the rocks of Aiguigan, an island at about three leagues from Tinian, those on shore were persuaded the ship could not survive the storm, the whole channel between the two islands appearing from the land like one continued breach, the sea swelling, breaking, and roaring, like mountains rolling over mountains, and forming the most awful and terrifying sight that the mind of man can possibly conceive. Indeed, the condition of those on board was truly pitiable; they were in a leaky ship, with three cables in their hawses, to one of which hung their only remaining anchor; they had not a gun on board lashed; nor a port barred in; their shrouds were loose; and their fore-top-mast unrigged; and they had struck their fore and main yards down before the hurricane came on, so that there was no sail they could set except the mizzen: to add to their misfortunes, they were no sooner at sea, than, by the labouring of the ship, whole floods of water rushed in through the hawse-holes, ports, and scuppers; which, with the usual leakage, kept the pumps constantly at work. Persuaded that their destruction was inevitable, sinking, however, was only their secondary concern; they judged, by the driving of the ship, that they were making towards the land, and that, in the darkness of the night, they should no otherwise perceive it than by striking upon it; but day-light relieved them from their uneasy apprehensions, and shewed them that the island they so much dreaded was at a considerable distance, and that a strong northern current had proved the means of their preservation. It was not, however, till after three days that the turbulent weather that had driven them from Tinian began to abate; when every man in the ship was so worn out with fatigue, that they found it impossible to man the pumps, and hand the sails at the same time. They had twice attempted to heave up the main and fore-yards, in which they had as often miscarried by the breaking of the jeers, and in

the last effort one of their best men perished. During all this time the ship was driving to leeward, and dragging her sheet anchor, the only one she had left, with two cables an end at her bows. This was a circumstance of the greatest consequence, and required a speedy remedy; for though upon a third exertion of their whole force, they had replaced their yards, they durst not, while the anchor continued in that situation, venture to spread their canvas. Some rest and refreshment became necessary before a work of such labour could be proposed to a feeble and diminished crew, who hardly consisted of 100 men. It was, therefore, five days after their departure before they could secure their anchor; and now they set their courses, and, for the first time, stood to the eastward, in hopes of soon regaining the island, and rejoining their Commander and the rest of their company: but in this they were unhappily disappointed; for having run, as they thought, the distance necessary for making the island, and being in full expectation of seeing it, they found themselves bewildered by the irregularity of the currents, and knew not what course to steer, till, after several days uncertainty, they came at last in sight of Guam, from whence they directed their course with infinite labour to Tinian, the wind being constantly against them, and the tide variable. This severe employment held till the 11th of October, when, after nineteen days absence, they appeared again in the offing, and were reinforced from the shore, to the inexpressible joy of the whole crew.

A few days after the ship was driven off, some of the people on shore cried out, A fail! and this spread a general joy, supposing it to be the Centurion returning; but presently a second fail was descried, which wholly destroyed the first conjecture, and made it difficult to guess who they were. The Commodore turning his glass towards them, saw they were two boats; and instantly concluding that the Centurion was gone to the bottom, and that those were her boats returning with the remains of her people, this sudden suggestion wrought so powerfully upon him, that to conceal his emotion, he was obliged to retire to his tent, where he passed some bitter moments in the firm persuasion that all his hopes were now at an end, and that, instead of distressing the enemy, he must himself with his people fall a prey to their relentless cruelty. He was, however, soon relieved from this mortifying thought, they appearing, upon their nearer approach, to be Indian proas directing their course towards the bay, with a view, as was supposed, to relieve their countrymen, or to take on board their provisions. On this intelligence, the Commodore ordered his people to conceal themselves; but the proas, after advancing within a quarter of a mile of the shore, lay by for the space of a few hours, and probably observing some change in the appearance of the place, which might raise their suspicion that an enemy lay in ambush, they got again under sail, and steered to the southward.

After this incident an opinion began generally to prevail, that the Centurion would never more appear at this island; and that she was either lost, or forced upon the coast of China, from whence, in her crazy condition, it would be impossible for her ever to return. Though the Commodore did not apparently give into this opinion, yet he was not without his fears; and, therefore, to provide against the worst, he proposed cutting afunder the Indian bark which they took on their first arrival, and lengthening her in such a manner as to be capable of taking on board all who were then upon the island, and following the ship if peradventure she should be driven to Mocoa. After some hesitation, owing to the difficulty attending the execution, the men were at length prevailed upon to engage in the work, and the Commodore by his example encouraged their diligence; for, being always at work by day break himself, it was thought a disgrace to be idle when their Chief was employed. It fortunately happened, that the carpenters both of the Gloucester and Trial were on shore, and that they had brought for safety their chests

chests of tools with them. The smith, too, was on shore with his forge, but his bellows was still in the ship. This defect occasioned some delay; but was soon supplied by the ingenuity of his shipmates, one or other of them never being at a loss for expedients on such occasions; they limed a fresh hide for leather, the carpenters shaped out a wooden frame, and a gun barrel served for a nozel. The smith being now in readiness to prepare the iron-work, some were employed in cutting down trees, and sawing them into planks, whilst the main-body were busied in digging out a draw-dock to receive the bark, and in laying of ways to heave her up and down. All, in short, were variously employed; and the work went on successfully for 16 days, in which time the bark was sawn asunder, her two parts separated, and placed at the proper distance from each other; and, the materials being all in readiness before-hand, they proceeded with no small dispatch in the enlargement, insomuch that they fixed the 5th of November as the day when they should be ready to depart. The alacrity with which this business was carried on, left no room for reflection among the common sailors, though their superiors were not without their fears. They had no sea-provisions, except some jerked beef, which the Indians had prepared and abandoned when they fled, and they had a run of 600 leagues before they could presume upon a supply; they had no bread, and the bread-fruit on the island could not be preserved at sea; they wanted salt; and, what was still a more necessary article in their present situation, they wanted ammunition for their defence, in case of an attack from the enemy; for, upon the strictest search, no more than 90 charges of powder could be collected, which was short of one round a-piece for each of the company; they were, too, in an unknown sea, and wanted instruments to direct their course: in short, though the common men had no other thought but how they should get on board, the officers foresaw a thousand difficulties, which were almost insurmountable to human apprehension, but which they carefully concealed, that the main business might not be retarded.

But, in the midst of these gloomy apprehensions, which, the nearer the time of their departure approached, still became the more serious, and when all hope of seeing the Centurion at Tinian had subsided, one of the Gloucester's men, being upon a hill at a distance looking out for cattle, perceived, as he fancied, something like a ship in the clouds, which, on steadily observing it, seemed to move slowly towards the land. It was not long before he was sensible of its approach, and persuading himself it was the Centurion, he in an ecstasy ran towards the landing-place, crying to his comrades, The ship! The ship! This being heard by the nearest, was echoed from mouth to mouth till it reached the spot where the Commodore was at work, who, on hearing the joyful news, threw down his axe, and joined in the general transport. In a few hours the Centurion appeared in the offing, and a boat with 18 men was sent off to reinforce her, and to carry fresh meats, fruits, and refreshments, for the crew. In the afternoon of the 11th of October she happily cast anchor, the Commodore went instantly aboard, and the joy and congratulations on that occasion were equally sincere and mutual.

The labour of the artificers was now at an end, and another kind of employment succeeded, which was that of laying in water for the remainder of the voyage. Now also hunting, shooting, setting and every device that could be contrived to catch live cattle, hogs, and poultry for stores, took place; while, at the same time, the Commodore and officers amused themselves with traversing the island, and examining more minutely its several parts. In one of these excursions, being on a rising ground, they observed, in a valley beneath them, the appearance of a small thicket, which, by attending to it, seemed to have a progressive motion, as indeed it had; but was no other than a parcel of cocoa-bushes trailed upon the ground by persons concealed beneath

them. From this uncommon circumstance, it was immediately concluded, that the Indians, whose boat they had surprized upon their first arrival, must be the persons who were dragging the bushes, and that it could not be far to the place of their concealment; they therefore kept their eye upon them, and traced them to their cell; but, to their surprize, when they came to enter it, they found it abandoned, though all things were ready prepared for dinner, and stood smoking hot on a table of turf. The officers, having in vain endeavoured to track them, returned, and, with an appetite increased by the keenness of the pursuit, sat down to that meal which the poor hungry savages had abandoned. It consisted of salted spareribs, cocoa-nuts, and bread-fruit; all which they found ready dressed, and in quantity as much as they all could eat.

On the third day after the second arrival of the ship, the Commodore being on board, a sudden gust of wind arose, and again brought home our anchor, and drove us out to sea. Our chief officers were now all on board; and only about 70 of our men, with a midshipman or two to command them, were employed on shore in filling water and catching cattle. Of these about 30 came off to us in the cutter, and the eighteen-oared barge was sent for the rest; but they not being in readiness, and the ship quickly driving out of sight, it was no longer in their power to join us. However, as the weather soon proved favourable, and we were now stronger and healthier than at our first disaster, in about five days we regained the road, and anchored safe in our former station. On our return we found the Spanish bark restored to her old dimensions, and the parts brought together, and in good forwardness to be compleated; for the few remaining people, despairing of the return of the ship, had determined to follow her to her destined port. We now laboured indefatigably to get in our water, in order to sail, in which service two of our men employed in the well unfortunately perished; for the sides of the well being loose earth, by the carelessness of those above, in not properly attending the filling, the bank gave way by the weight of a heavy cask, and both that and the bank fell in upon them together. Some other misfortunes happened through haste in rafting the casks to the ship; yet, notwithstanding, being such as are generally accounted trifling on board a man of war, our watering went on so successfully, that by the 20th of October, it was compleated; and on that day leave was given for a man from each mess to go ashore, and gather as many oranges, lemons, cocoa-nuts, and other fruits of the island, as should be sufficient for us all while at sea. This being accomplished, the Spanish bark set on fire, the men returned on board, and the boats hoisted in, on the 21st we set sail; and the wind being fair, and the weather moderate, nothing remarkable happened till we arrived on the coasts of China, except that while we were passing by the rocks of Vele Rete, near the south end of the island Formosa, we were alarmed by a cry of fire on the fore-castle, which brought the whole crew together in the utmost confusion, so that it was difficult for some time to reduce them to order; but, as soon as discipline took place, and a proper examination could be made, it was found to proceed from the furnace, where the bricks, being over-heated, had begun to communicate the fire to the wood-work, which, had it not been timely discovered, might have been of the most dreadful consequence; but, as it fell out, it was extinguished with the greatest facility, and the brick-work so secured, that no accident of the like kind could again happen.

From the island of Formosa we directed our course, so as to fall in with the coast of China, to the eastward of Pedro Blanco, as that rock is generally esteemed the best direction for ships bound to Mocao; and, on the 6th of November we fell in with it, when we were presently surrounded by an incredible number of fishing-boats, which covered the surface of the sea as far as the eye could reach. Nor was this swarm of fishing vessels peculiar to that place; for, as we ran on to the westward, we found them as abundant on every other

part of the coast. From among these we had no sort of doubt of procuring a pilot to Mocao; but, when we thought ourselves near it, though we tempted them with shewing them bags of Spanish dollars, for which, it is said, a Chinese would sell his father, yet not one of them would venture to come on board us, nor give us the least intelligence; neither did our ship, the like of which, so armed and fitted, had never before appeared upon their coasts, seem to excite in them any curiosity: they continued their fishing with the same apparent indifference as if any trading ship had been passing by; and, when we made them signals, they disregarded them as much, though they certainly understood them, as if we had been only in sport. The next day, however, about two in the afternoon, as we were standing to the westward within two leagues of the shore, still surrounded as before, we observed that a boat a-head of us waved a red flag, and blew a horn. This we apprehended was a signal for us, and accordingly we hoisted out our cutter, and sent to know the meaning of it; when we presently discovered our mistake, and that it was only the usual notice to leave off fishing, which the whole fleet instantly obeyed. Being thus disappointed, we kept on our cruise till we came to a group of islands, round the westernmost of which we were directed to pass, and then to haul up. While we were thus employed, a Chinese pilot came on board, and in broken Portuguese undertook to pilot us into harbour for 30 dollars, and on the 12th of November anchored us safe in Mocao-road; where the first thing we did was to salute the fort, and to send to the Portuguese Governor to advise with his Excellency in what manner to behave to avoid giving offence to the Chinese. The difficulty the Commodore principally apprehended related to the port charges usually paid by ships in the river Canton, from which charges men-of-war are exempted in every port of Europe, and which the Commodore was determined not to be forced to pay in this. In the evening the boat returned with two officers, who delivered it as the Governor's opinion, that, if the Centurion ventured into the river of Canton, the duty would most certainly be expected; and, therefore, if the Commodore approved of it, he would send a pilot to conduct the ship into another harbour, called the Typa, where it was probable the port charges would never be demanded. To this proposal the Commodore agreed, the pilot was sent, and the ship safely moored.

Next day the Commodore paid a visit in person to the Governor, to solicit a supply of provisions, and of naval stores to refit the ship. The Governor very frankly acquainted the Commodore, that he durst not openly furnish either the one or the other; for that he himself neither received provisions for his garrison but from day to day, by permission from the Chinese government, nor any thing else but what his present necessities required: however, he assured the Commodore in a friendly manner, that he would give him all the assistance in his power. On this declaration, the Commodore determined to go to Canton himself, to procure a licence from the Viceroy to purchase a supply, and, with this view, hired a Chinese boat for himself and his attendants to carry them into port: but just as they were ready to embark, the Hoppo refused to grant them a permit; nor would he, notwithstanding all the interest the Commodore could make, withdraw the prohibition, till he was threatened to be compelled to it by force. This operated when fair means had failed; a permit was next day sent on board, and the Commodore proceeded to the English factory to consult with the principal officers there about the cautions that were to be used, lest the factory should suffer by violent measures, which he was solicitous to avoid. They advised him to transact the business by the mediation of the Chinese merchants, who at first undertook to accomplish it; but, after trifling with him more than a month, they declared they durst not interfere in it. The merchants then undertook to procure him provisions clandestinely; but that would not suffice. Upon his

return, he found the ship so much out of repair, that she could not proceed without being hove down; he, therefore, next day wrote a letter to the Viceroy, acquainting him, that he was Commodore of a Squadron of his Britannic Majesty's ships that had been cruising in the South Seas against the Spaniards, who were at war with his nation; that his ship was leaky; that his people were in want of provisions; that he had put into Mocao, a friendly port, for a supply, but that, being a stranger to the customs of the country, he had been unable to succeed; and, therefore, requested, that he might be permitted to employ workmen to repair his ship, and that he might be supplied with provisions at the accustomed rates at which the articles he stood in need of were generally sold. Another difficulty was now started as to the delivery of this letter, the Hoppo at first refusing to intermeddle with it; but, on the Commodore's expressing some resentment, and threatening to convey it to Canton by his own messengers, he at length undertook not only to deliver it, but to procure an answer: accordingly, though the letter was only dated on the 17th of December, on the 19th a Mandarin of the first rank, together with two others of an inferior class, and their attendants, having in their retinue 18 half gallies, decorated with streamers, and furnished with bands of music, came to a grapple a-head of the Centurion, whence the Mandarin sent in form to acquaint the Commodore, that he came by order of the Viceroy to examine the condition of the ship, and to report the same as it should appear to him upon a just survey. On this message, preparations were instantly made to receive him; in particular, a hundred of the most mighty men on board, uniformly dressed in the regimentals of the marines, were drawn up under arms on the main-deck against his arrival. When he entered the ship, he was saluted by the drums and military music, and conducted by some of the principal officers to the quarter-deck, where he was received in state by the Commodore, and then introduced to the great cabin, where he explained his commission, and presented the persons he had brought with him to take the survey. The Mandarin appeared to be a person of superior abilities, and endowed with a frankness and honesty not usually to be met with among the ordinary ranks of Chinese officers; and, being an eye-witness of the dangerous state of the leaks, and of the necessity there was for a thorough repair, he expressed his entire acquiescence in the report that had been given, and promised to lay the same immediately before the council upon his return. He was exceeding curious in inspecting the ship, in examining her guns, and poising her great shot. He expressed his astonishment at her strength and her magnitude; and the Commodore, to increase his wonder, and shew his own power, let him know how easy it would be for him to destroy the whole navigable force of China, and lay the city of Canton in ruins; but, nevertheless, he assured him, that not the least violence should be offered, provided his wants were supplied upon reasonable terms.

At the same time the Commodore complained of the behaviour of the officers at Mocao, who had prohibited the country people from selling provisions to his company, though they had paid for what they purchased in sterling silver. The Mandarin heard the complaint without emotion, but said it should be remedied for the future. After the business was over, dinner was ordered, and the Commodore apologised for the meanness of the fare from the difficulty he had to procure better: but the two inferior Mandarines, who were the only persons of their retinue permitted to sit at table with them, shewed no dislike to any thing set before them, except the beef, to which they have the same dislike as the Jews have to pork, from an early prejudice derived from their ancestors; of this the Commodore was not apprized, nor were they offended at its being set before them. They were, indeed, very awkward at the use of knives and forks, and it was found necessary

necessary to introduce their own servants to carve for them, before they could make an end of their dinners. But if they were deficient in their manner of eating, they were no novices in putting about the glasses; for there was not an officer at table that durst engage with them. Seeing they were fond of Frontiniae, and that they presently emptied four or five bottles of it without any effect, the Commodore ordered a bottle of Citron water to be brought up, which, on tasting, they liked, and, the Commodore excusing himself on account of an illness he had not yet recovered, they clapped a ruddy-faced officer on the shoulder, and desired him to pledge them, saying, by their interpreter, they were sure he could not plead illness for declining his glass. When the bottle was out, they all rose from table, without appearing to be in the least disordered, and, after the usual ceremonies, departed, very well pleased with their entertainment.

The Commodore now impatiently expected the licence he had requested; but it was several days before it passed the necessary forms, chiefly owing to the intrigues of a Frenchman, who, having the advantage of speaking the language fluently, was at no loss in traversing the measures of the friendly Mandarin in favour of Mr. Anson; but a repetition of the threats already referred to, produced, at last, the desired effect. On the 6th of January, the licence was received, and the carpenters were set to work; but, previous to this, the prohibition was taken off, and provisions were every day brought to the ship in plenty.

It was, however, the beginning of April before the repairs could be completed, and the Chinese began to be very uneasy at their long stay. They had frequently sent messages to the Commodore to hasten his departure, not knowing or believing that he was no less in earnest to be gone, than they were to be freed from the dread of his stay. At length, on the 3d of April, two Mandarines came on board from Mocao, with a peremptory command addressed to the Commodore, requiring him to depart; to which he made answer, in a determined tone, that he would go when he thought proper, and not when they presumed to command him. After this rebuke, however, all communication was forbidden, and no more provisions were suffered to go on board; and so strictly were those injunctions carried into execution, that from thenceforwards nothing could be purchased at any rate whatever. On the 6th of April, the Centurion weighed, and warped to the southward; and, by the 15th, she was safe in Mocao road, having completed her water as she passed along. On the 19th, she again weighed anchor, and put to sea.

But long before this, that is, some time in November, Captain Saunders, Commander of the *Trial's* prize, took passage on board a Swedish ship with dispatches from the Commodore to the government. And soon after, that is, about the middle of December, Captain Mitchell, Colonel Crackerode, Mr. Taswell, with his nephew Mr. Charles Herriot, and the Rev. Mr. Walter, embarked on board the company's ships on their return home. About this time we received the first news of the safe arrival of the *Severn* and *Pearl* (the two ships of our squadron that parted from us in doubling Cape Horn) at Rio Janeiro, on the coast of Brazil. The *Severn* had been remarkable for the extraordinary sickness that had been more fatal on board her than on board of any other in the whole squadron, inasmuch that her hands had been twice recruited from the Centurion during her voyage to the straits of Le Maire; and yet when she parted company she wanted hands to navigate her in a storm, which was the reason of her return. It was from the knowledge of this uncommon mortality that prevailed among the crew, that the Commodore concluded the *Severn* to be lost. The news, therefore, of her and the *Pearl's* safety was received with the greater pleasure, as we had long entertained an opinion that both of them had perished. But to return from this digression:

From the 1st to the 15th of April, we had stormy weather, with heavy rains and such amazing and ter-

rifying claps of thunder and flashes of lightning as nothing of the kind I had ever seen or heard bore any proportion to. This was upon the breaking-up of the easterly monsoon, when such storms are usual in the country, accompanied sometimes with dreadful gusts of wind, called here by the name of Tuffoons, of the effects of which the Chinese relate very wonderful stories.

While we were warping out of the harbour, the Commodore went on shore to Mocao, to take leave of the Portuguese Governor, who had, to the utmost of his power, behaved in a very friendly manner; and, at his coming from the fort, he was saluted with 15 guns.

During our stay we had entered about 20 fresh hands, being chiefly Lascars, Persians, and Dutchmen; so that our whole complement, when we sailed, amounted to 224 men and boys, among whom were some of all nations, languages, and religions.

Being now at sea, we were some time in a state of uncertainty what course the Commodore intended to steer. He gave out at Mocao, that he was bound to Batavia, and thence to England; but his real design was very different. The project the Commodore had resolved upon in his own mind, was, to cruise for the annual ship from Acapulco to Manilla; and, not discouraged by his former disasters, he determined again to risque the casualties of the Pacific Ocean, and to take his station off Cape Spirito Santo on the island of Jamal, being the first land the Acapulco ships always make in approaching the Philippines.

Being now at sea, it was no longer necessary to conceal this project; he, therefore, summoned all his people on the quarter-deck, and in a short, but spirited speech, informed them of his design; which was received by them with the most expressive tokens of general approbation: and such a confidence of succeeding diffused itself through all the ship's company, that the Commodore, who had taken some Chinese sheep to sea with him for his own provision, enquiring one day of his butcher, why he had lately seen no mutton at his table? the man replied dryly, that in truth there were only two sheep left; and these, with his honour's leave, he proposed to reserve for the entertainment of the General of the galleons.

When the Centurion left the port of Mocao, she stood for some days to the westward; and, on the first of May, passed the island of Formosa; and, steering to the southward, on the 4th in the evening they came in sight of the Bashee Islands, which they suspected to be wrong laid down by Dampier, and from observation found them 25 leagues too far to the westward. On the 20th of May, they came in sight of Espirito Santo. As it was known there were centinels placed upon the Cape to make signals to the Acapulco ships, the Commodore immediately tacked, and ordered the top-gallant-sails to be taken in, to prevent a discovery; and this being the station in which he proposed to cruise, he fixed the limits between the latitude of 12 deg. 50 min. N. and 13 deg. 5 min. the Cape itself lying in 12 deg. 40 min. N. and in 4 deg. of east longitude from Point Tobago Xima. It was now the time when the Manilla ship was every hour expected; for they seldom or never fail of making land in the month of June, and sometimes sooner, and it was now the last day of May, according to their stile, when the Commodore took his station.

It were tedious to entertain the reader with the various conjectures, surmises, doubts, and anxieties, that agitated the minds of the people on board, from the day they came in sight of the Cape till the day that Mr. Charles Proby, a midshipman, called out from the mast-head, A fail! This was on the 20th of June, just one month after their arrival at the Cape. There did not remain a doubt but that it was one of the galleons (for two were expected this year, as none had been permitted to sail the year preceding); and the Commodore accordingly stood towards her. At half after seven in the morning, they could see her from the deck, at which time she fired a gun to leeward, and took in her

her top-gallant-sails, as a signal, as it was then supposed, to her comfort; but in reality, as a signal to her own people to prepare for action. The Commodore was surprized to see her steadily pursue her course, and was now in no fear of losing sight of her, as at noon he could fetch her wake. Her consort not appearing, it was concluded they had parted company; and it now became visible, that the galleon did not intend to fly, but to fight. Every preparation had been previously made on board the Centurion, and all hands properly instructed; so that every man on board repaired to his post with as much regularity and unconcern as if preparing for a review. Thirty of the best marksmen lined the tops; two men placed themselves at a gun to load them: and gangs of ten men each were appointed to go from gun to gun, to run them out, and fire them as fast as they were loaded. A constant running fire was by this means kept up, and no interval allowed for the enemy to stand to their guns in safety, as is common when whole broadsides are discharged at once.

About one in the afternoon, the galleon hauled up her fore-sail, and brought to under top-sails, with her head to the northward, hoisting Spanish colours, and having the standard of Spain flying at the top-gallant-mast-head. About the same time the Centurion hoisted her broad pendant and colours, being within gun-shot of the enemy; and the Commodore, seeing them clearing their decks of their cattle and lumber, gave orders to fire the chace-guns, to disturb them in their work. The galleon returned the fire with two of her stern-guns, one of which carried away one of our fore-shoulds, and our fore-stay tackle, which could not have been done by an ordinary ball. The Centurion setting her sprit-sail fore and aft for boarding, the galleon, out of a bravado, did the same. Soon after, the Centurion shot a-breast of the enemy within pistol shot, and now the engagement became hot. For the first half hour the Centurion over-reached the galleon, and lay on her bow, and, by the wideness of her ports, could traverse almost all her guns upon the enemy, whilst the galleon could only bring a part of hers to bear upon the Centurion in return. In the heat of the action, the masts with which the galleon had stuffed her netting took fire, and burnt violently, blazing up near as high as the mizzen-top. This accident threw the enemy into the utmost terror, and also alarmed the Commodore, for fear the galleon should be burnt, and for fear he himself might suffer by being closely grappled by her. Happily, however, that danger was averted, and the fire extinguished, by cutting away the netting, and letting the whole tumble into the sea. All this while the Commodore kept his first advantageous position, firing with great regularity and briskness; while at the same time the galleon's decks lay open to our top-men, who, having at their first volley driven the Spaniards from their tops, made prodigious havoc with their small arms, killing or wounding every officer but one that appeared upon the quarter-deck, and wounding in particular the General of the galleon himself. Thus the action continued for more than half an hour; but then the Centurion lost the superiority of her situation, and came close along-side of the galleon, when the enemy continued their fire with great activity for near an hour longer; yet, even in this position the Commodore's grape-shot swept their decks so effectually, and the number of the dead and wounded became so considerable, that they began to fall into great confusion, especially as the General, who was the life of the action, was no longer able to exert himself. The disorder was so great, that their officers were seen from the Centurion running about to prevent the desertion of their men from their posts: but all their endeavours were in vain; for, after having, as a last effort, fired five or six guns with more judgment than usual, they yielded up the contest; and, the galleon's colours being singed off the ensign-staff at the beginning of the engagement, she struck the standard at the main-top-gallant-mast-head; but even this office would have been at the peril of the man's life, had not the

Commodore, observing what he was about, given express orders to leave off firing.

The Commodore, when the action was ended, resolved to make the best of his way with his prize to the river Canton, being in the mean time fully employed in securing his prisoners, and in removing the treasure from on board the galleon into the Centurion. His first business was to commission the ship, and put her under the command of proper officers: Lieutenant Saumarez was appointed Captain, and was immediately ordered on board to take possession of his charge.

But, just as the galleon had struck, the officer who commanded between decks came up, seemingly to congratulate the Commodore on his conquest, but at the same time privately whispered to him, that the Centurion was dangerously on fire near the powder-room. It seems one of the lads called powder-monkeys, being heedless, a cartridge that he was carrying blew up in his hands; this fired another, and that three of the lower-deck guns on the off side of the ship, which being happily loaded and laid down for service, and the ports hauled up to vent the smoke, they did not occasion the least mischief; however, the cartridges and guns together raised such a smother, that it was at first doubtful whether it proceeded from the explosion, or from a part of the ship being on fire. In fact, upon examination, it was found to proceed from both; for, part of a cartridge having fallen between the planks of the ceiling, close aft by the scuttle of the Chaplain's cabin, not only a considerable smoke issued out, but a very sensible heat, and, had it not been immediately extinguished, the consequence would have been dreadful: to be brief, a few pails of water seasonably applied did more than all the water of the ocean could have effected after an hour's delay.

This alarm being thus happily subsided, we draughted out 50 of our people (of whom myself was one) to board and man the prize. I had heard we had killed them 60 men, and wounded as many more, and expected to have seen the horrid spectacle of mangled limbs, dead carcases, and decks covered with blood; but no such spectacle appeared; a party having been properly stationed, during the time of action, to wash away the blood, and to throw the dead over-board. We found, however, many desperately wounded, and among them the General, who had received a musket-ball in his breast, and was so ill, or pretended to be so ill, that it was judged unsafe to move him from his cabin; but all the other officers, together with the passengers of note, were sent on board the Centurion. Among the latter was an old gentleman, Governor of Guam, who was going to Manila to renew his commission, and who had scarce mounted the Centurion's side before he was received with open arms by Mr. Crooden, Captain of marines, who 36 years before, at the battle of Almanza, had been his prisoner, and honourably used by him. These two renewed their old acquaintance, and Captain Crooden had a long-wished-for opportunity of returning the favours he had formerly received, and which he gratefully remembered.

The ship, upon examination, was found to contain to the value of more than a million and a half of dollars, was called the *Nuestra Señora de Cabadonga*, Don Jeronitno de Montero, Commander, by nation a Portuguese, and accounted the most intrepid officer employed in the Spanish mercantile service: and, indeed, in my opinion, he was more brave than prudent; for, surely, no wise man, intrusted with such a cargo, six leagues to the windward of a man-of-war purposely stationed to intercept him, would have borne down upon his enemy, and braved him to his teeth, when, with the advantage of the wind, he might have gone safe to port, from whence he was not more than 10 or 12 leagues distant, and where he might then have set his pursuer at defiance.

His galleon was indeed larger than the man of war, was pierced for 64 guns, but had only 36 mounted, most of them 12 pounders, and 17 of them brass: the

*The Engagement of the
CENTURION and ACAPULCO,
off Cape Espiritu Santo, in which
the latter was taken.*

had, besides, 28 peteraroes, in her gunwale, quarters, and tops, carrying each a 4lb. ball; and, before the engagement, she mustered 640 men capable of bearing arms, officers, and passengers included. She was, besides, well furnished with small arms, and was particularly provided against boarding, both by her close quarters, and by a strong net-work of two-inch rope laced over her waste, and fortified with half-pikes placed in the manner of chevaux de frise; but, notwithstanding all her defences, she had 64 men killed, and 84 wounded, whilst the Centurion had only two men killed, and a lieutenant and 16 men wounded, all of whom recovered, one man only excepted.

And now the Commodore learnt from some of the prisoners, that the other ship, which he had kept in the port of Acapulco the year before, instead of returning in company with this, as was expected, had failed earlier in the season than usual, and was probably got into Manila before the Centurion set sail from Mocao; so that, notwithstanding our present success, we had reason to regret the loss of time occasioned by the delays of the Chinese, which prevented our taking two rich prizes instead of one; though, to say the truth, it would not have been an easy task to dispose of the prisoners, which, even as it fell out, was a matter that gave the Commodore no small disquietude; for they were above double the number of our own people; and some of them observed, when they were brought aboard, how slenderly we were manned; and the General himself could not help expressing his indignation to be thus beaten by a handful of boys. It was therefore necessary for our own preservation to prevent their rising; and that could not be securely effected without exercising a degree of severity which in any other circumstances could not have been justified on the principles of humanity; for there was no method practicable but that of stowing the men in the holds of the two ships; and as for the officers, 17 in number, they were confined in the First Lieutenant's cabin, under a guard of six men, first depriving them of their arms, and then keeping a strict watch on all their motions. Indeed, the sufferings of the common men, such of them in particular who were not employed in navigating the ship, were much to be pitied; for, the weather being extremely hot, the stench of the holds loathsome beyond conception, and their allowance of water but just sufficient to keep them alive, being only a pint a day for each man, it was next to a miracle that not a man of them died during their confinement, except five of the wounded, who expired the very night they were brought aboard the Centurion. Thus circumstanced, the motives of humanity, as well as interest, strongly urged the Commodore to hasten his return to China; and the prize being much damaged, both in her hull and rigging, it was found necessary to take her in tow for the quicker dispatch.

On the 21st of June it blew a storm, which continued till the 25th, when the sea ran mountains high: in this storm the Centurion lost her long-boat, and the prize a launch.

On the 2d of July we passed between the Bashee Islands, though the rippling of the sea seemed to indicate breakers or rocky ground; but the wind being so far to the northward as to render it difficult to weather them, we risked the danger to shorten the voyage. On the 8th of July we made the coast of China, and on the 11th came to an anchor off the city of Mocao; from thence we proceeded to the river of Canton, where we met with the usual obstructions from the custom-house officers, and where the Commodore was again obliged, as it were, resolutely to force his way to his intended station. The officer who came to take the dimensions of his ships, in the usual manner, seemed astonished when he talked of being exempted from the accustomed rates, and gave him to understand that the Emperor's duty must be paid by every ship that came into his ports; and the pilot had private instructions not to carry the ships through the Bocca Tygris, or narrow pass that forms the entrance into the

river of Canton, till security was given for the accustomed charges.

And here it may be necessary just to mention, that this pass, not more than a quarter of a mile in breadth, is defended by two forts on the opposite sides; but these the Commodore disregarding, and being determined to enter the river without delay, as the stormy season was approaching, he caused the pilot to be brought before him, and in a determined tone threatened to hang him to the yard-arm, if he did not instantly take charge of the ship, and carry her safe, without striking ground, through the Bocca Tygris into the open river. The poor pilot performed his office, but did not escape punishment for what he could not help. He was instantly seized on being released from the Centurion, committed to prison, and rigorously disciplined with the bamboo. However, he found means to get access to the Commodore afterwards, to supplicate a recompence, who, ever ready to reward the sufferers in his service, gave him such a sum as more than contented him for his whipping. Nor was the poor pilot the only sufferer; for the Governors of the forts were both displaced for not preventing what it was in vain for them to attempt to oppose, and for not doing what all the council must know was impossible to be done.

On the 16th the Commodore sent his Second Lieutenant to Canton, with a letter to the Viceroy, assigning his reasons for putting into that port, demanding a licence for purchasing provisions and stores, and intimating an intention of waiting upon his Excellency in person to make his acknowledgements. The Lieutenant was civilly received, and promised an answer the next day. In the mean time, the principal officers of the prize desired permission to go to Canton on their parole, which was readily granted. These no sooner arrived, than they were called before the magistracy, and examined; when they generously and frankly acknowledged, that they fell into the hands of the Commodore by the chance of war, and that though they were prisoners, they were notwithstanding at liberty to treat for their release: they said farther, that it was not the custom among European nations to put prisoners to death; but that the laws of war authorized much severer treatment than they had hitherto met with from their conquerors. This confession from an enemy had great weight with the Chinese, who, till then, though they had revered the Commodore's naval force, had yet suspected his morals, and had considered him rather as a lawless free-booter, than as one commissioned by the state for the revenge of public injuries.

On the 20th of July, three Mandarines with their retinue came on board, and brought the Viceroy's permit for a daily supply of provisions, and for pilots to carry the ships up the river as high as the second bar; and, at the same time they delivered a message from the Viceroy, in answer to that part of the Commodore's letter which related to his visiting his Excellency; the substance of which message was, that the Viceroy wished the Commodore to defer his visit till the hot season was over, but that, in September, when the weather would be more temperate, he should be glad to receive him. This the Commodore looked upon as a finesse, knowing an express was sent up to the Emperor's court at Peking; whence the real motive for putting off the visit seemed to be to gain time to receive the Emperor's instructions concerning the ceremony to be observed at his reception. The Mandarines, having dispatched this part of their commission, next entered upon the business of the port charges; whereupon the Commodore at once cut them short, by telling them, that, as he did not come to trade, he was not to be treated upon the same footing with trading ships; that his Britannic Majesty's ships never paid customs in the ports of Europe, nor ever would be subject to any pecuniary imposts in any other port whatever. Finding nothing to be gained on this head, they told the Commodore, that they had still another matter in charge, and that was the release of the prisoners taken on board the galleon; for that the Emperor would never permit

the subjects of princes with whom he was in alliance to be held in bondage in his dominions, nor could the Viceroy answer it to his Sovereign if he suffered it; and that, therefore, his Excellency hoped that the Commodore would give immediate orders for their release.

Though nothing could be more agreeable to the Commodore, who wanted much to be rid of the incumbrance, than this requisition, yet, to enhance the favour, he at first raised difficulties; but at length suffered himself to be prevailed upon by their intreaties, and concluded, by assuring them, that, to shew his readiness to oblige, he would deliver up the prisoners whenever the Viceroy would please to order boats to fetch them. Matters being thus adjusted, the Mandarin's departed: and, in a few days, two Chinese junka were sent from Canton to carry them to Mocao, under the direction of one Captain Fial, Commander of a Spanish merchant-man, to whose ship we gave chase in our passage from the Bashee Islands to Mocao, but lost sight of her in the night.

To this gentleman the General of the galleon, and all his officers, except one who accompanied us to England, were delivered up. And now I have occasion to mention the General, I cannot help relating an affair which gave us on board the prize a great deal of concern, and sufficiently shewed the meanness of his spirit, and his beggarly craft. I have already taken notice of his being wounded in the engagement, and of his being indulged with the use of his own cabin till he was fit to be removed. The Commodore over and above this indulgence, sent him a surgeon from his own ship, upon a complaint that the Spanish surgeon on board the galleon was quite ignorant in his profession; but at the same time he sent an officer to demand his commission. Pretending to the officer that he was unable to move, he referred him to a small box in a locker of his private cabin, in which, he said, it was, and likewise a sword-belt set with diamonds of great value, his own property; but, upon search, neither the commission nor the belt could be found: and, as some of our people had been rummaging both that and other parts of the ship, he protested, that, if they could not be there found, they must have been taken away and concealed. Under colour of this concealment, though he never produced his commission, he all along received the most humane and gentlemanlike treatment that the most worthy officer could desire or expect; and such was continued till his departure, when neither his chests, of which he had two very large ones, nor any of his trunks or cases were suffered to be searched: but every thing which he claimed as his personal effects were delivered to him with the greatest care and punctuality; though, as I was afterwards informed, he had many valuable ventures concealed, which ought to have been delivered up as prize to the captors; but, as that was never examined into, he carried them off with the rest, and, it was supposed, was not the least among the gainers by the capture of his ship. He persisted, however, to the last in the loss of his commission and belt, and, though there were none on board on whom he could charge the theft, yet the Commodore sufficiently expressed his displeasure against the whole by the prohibition he laid upon us, as soon as the prize came to an anchor in the river, by which all communication was cut off between us and the country people, and no boat suffered to come near us but our own; by which severe order we were entirely debarred from purchasing our own provisions and necessaries from the Chinese, which the people in the Centurion were at full liberty to do; neither could we employ the Chinese tradesmen to supply us with apparel, of which we stood greatly in need, though in that too the Centurion's people were indulged: and all this for no other reason, that was ever assigned, but that, if the jewels the General had lost were concealed, the Commodore was determined the secreter should have no opportunity of disposing of them without being discovered. Had this precaution been taken, as it ought, for the satisfaction of those who suffered under the severity of the censure, and had the effects of

the Spanish General been properly inspected, the secreter would have been publickly exposed; for, when we afterwards fell down to Mocao with the ships, where we sold the prize, I was myself told by an Irish priest, that the General had both his commission and his belt; that he made no secret of the matter at Mocao; and that he had offered the jewels (being only made up by way of blind) among the merchants for sale.

But to return: during our stay in the river Canton, our people were employed in repairing the Centurion, over-hauling her sails and rigging, cleansing and ventilating her decks and quarters below, and in paying and decorating her hull; inasmuch, that when she came to sail, she had more the appearance of a ship newly fitted out, than one that had been a three years voyage in traversing the globe. While these things were doing on board the Centurion, we in the prize were doing in rummaging her treasure, till about the latter end of August, when we made a full end of our search, and found, upon account of the captors, in specie, 1,278,546 dollars, and 1,324 of wrought plate and virgin silver. The jewels we found were not then valued.

At the same time that the inferior-officers and seamen were employed in these different services, the Commodore had a still more important business in hand. He knew it was impossible for us to proceed to Europe without an ample supply of provisions and other sea stores; and, though we were furnished with a daily allowance, yet no order had been obtained for victualling us for our intended voyage. Application had indeed been made, and terms agreed upon with the contractors to furnish whatever was necessary; and they had undertaken to procure the Viceroy's permission for the delivery; but when, about the middle of September, the proper officer was sent to enquire what forwardness these things were in, he found that neither the baker had begun to bake the bread, nor the butcher to kill the oxen, nor was the least step taken to comply with any one article of the agreement. We could no otherwise account for this faithless procedure of the Chinese, than by supposing they meant to starve us into a compliance with their accustomed demands for port charges, with which the Commodore was determined never to acquiesce. Indeed, it was suspected, that the contractors themselves had some interest in promoting the delay, though it was not easy to penetrate the views by which they were influenced, as it may with truth be asserted, that in artifice, falsehood, and attachment to all kinds of lucre, the Chinese, as a nation, are not to be paralleled by any other people under the sun. It were endless to recount all the artifices, extortions, and frauds, which were practised on the Commodore and his people by this interested race. The method of buying provisions in China being by weight, the tricks made use of to make them heavy are almost incredible. At one time a number of fowls and ducks being bought for the ship's store, the greatest part of them presently died, which spread a general alarm on board lest they should have died of poison; but, on examination, it was discovered that they had been crammed with small stones and gravel to increase their weight. The hogs, too, bought of the Chinese butchers ready killed, were found to have had water injected into the carcasses for the same purpose; and when, to avoid this cheat, the hogs were bought alive, it was found that salt had been given them to increase their thirst, that methods had been used to suppress their urine, and that the tortured animals had been sold in that inflated state. Mr. Walter adds —[for it is on this authority that these instances are reported]—that, as the Chinese never scruple to eat the animals that die of themselves, they contrived, by their secret practices, when the Commodore put to sea, that part of his live sea-store should die in a short time after it was put on board; in order, therefore, to make a second profit of the dead carcasses which they expected would be thrown over-board, they followed in boats to pick up the carrion; and, accordingly, two thirds of the hogs dying before they were out of sight of land, their labour could not be in vain.

London Published by Alex Hogg at the Kings Arms N^o 16 Paternoster Row.

The treachery of the contractors being now discovered, the Commodore determined to renew his former requisition for an audience with the Viceroy. With this view, he notified his intention to the proper Mandarin, and desired that he would fix the time with the Viceroy when he would be pleased to receive him; at the same time giving him to understand, that, on the first of October, he intended to proceed in his boat to Canton. The Mandarin returned for answer, that he would acquaint the Viceroy with the Commodore's intentions. As it was apprehended, that the payment of the customary duties would be demanded at this interview, the Commodore took the necessary precautions to prevent the Chinese from facilitating the success of their pretensions by having him in their power at Canton, and, therefore, gave the command of the Centurion to his First Lieutenant Mr. Brett (now Sir Piercy), with orders, if he should be detained, to lie at the mouth of the river, and suffer no ship or boat to pass or repass till he was released, by which the whole navigation of the river would be immediately obstructed.

This being known to the Chinese, they were now more than ever embarrassed in their deliberations. The morning of the 1st of October arrived, and just as the boats crew, eighteen in number, which the Commodore proposed to take with him, appeared in their uniform, namely, scarlet jackets and blue silk waistcoats, the whole trimmed with silver, with silver badges on their jackets and caps, his linguist came to him from the Mandarin, to tell him, that a letter had been received from the Viceroy, desiring the Commodore to defer his intended purpose for two or three days, which not being doubted, the men were ordered to be undressed, and the preparations were all laid aside; but, in the afternoon of the same day, another linguist came on board, seemingly in a great panic, informing him, that the Viceroy had expected him up that day; that the council was assembled, and the troops under arms to receive him; and that the Viceroy was highly incensed at the disappointment, and had sent the Commodore's linguist to prison, chained, supposing him to be the sole cause of the contempt. This plausible tale gave the Commodore great uneasiness, not at that time suspecting any imposition; and though it afterwards appeared to be all a mere farce, yet the falsehood was so well supported by the artifices of the Chinese merchants, that three days afterwards the Commodore received a letter, signed by all the Supercargoes of the English ships then at the place, expressing their uneasiness at what had happened, and intimating their fears that some insult would be offered to his boat, if he attempted to come to Canton before the Viceroy was fully satisfied of the mistake. To this letter the Commodore replied, that he did not believe there had been a mistake, but was persuaded it was a forgery of the Chinese to prevent his visiting the Viceroy; that, therefore, he would certainly come up to Canton on the 13th of October, confident that the Chinese would not dare to offer him any insult, as well knowing he should want neither power nor inclination to make them a proper return.

On the 13th of October, the Commodore continuing firm to his resolutions, all the Supercargoes of the English, Danish, and Swedish ships, came on board the Centurion, to accompany him to Canton, for which place he set out in his barge the same day, attended by his own boats, and by those of the trading ships, which on this occasion were sent to augment his retinue. As he passed by Wampo where the European vessels lay, he was saluted by all of them except the French, and in the evening he arrived safely at Canton.

The Chinese merchants, who affected to appear very much pleased that he had met with no opposition in his way, pretended that the Viceroy was then so fully employed in preparing his dispatches for Peking, that there was no getting admittance to him; but that they had engaged one of the officers of his court, as soon as he was at leisure, to notify the Commodore's arrival, and endeavour to fix the audience. Though the Commodore knew this to be a falsehood, yet he suffered

himself to be persuaded by the European Supercargoes not to appear to doubt it, provided the Chinese merchants would undertake that his bread should be baked, his meat salted, and his stores in readiness, within the space of 40 days; after which time, if the least article was pretended to be forgotten, he would force his way to the Viceroy, and prefer his complaint. During the interval, while the contractors were endeavouring in earnest to fulfil the terms of the agreement on their part, (which by the way they insisted should be paid for in advance on his), a fire broke out in the suburbs of Canton, which on the first alarm might easily have been extinguished, by pulling down some of the adjoining sheds; which the Commodore with his officers and crew observing, were instantly about to carry into execution; but they were told, that whatever they pulled down they must build up again at their own expence, and that none but a Mandarin must presume to direct upon such occasions. The Commodore, on this admonition, dispatched his people to the English factory to assist them in securing their effects, as it was easy to foresee that no distance was safe from fire, where the common people contented themselves with gazing at it, and now-and-then holding up an idol or two to extinguish it. At length, however, a Mandarin came out of the city, with 4 or 500 firemen, who made some very feeble efforts to pull down the neighbouring houses; but by this time the fire had extended itself, and had spread among the merchants warehouses, where the Chinese firemen had neither spirit nor skill to encounter it; so that it was feared the whole city would have been laid in ashes. In this emergency, the Viceroy vouchsafed to make his appearance, and a message was sent to the Commodore requesting his assistance. Accordingly, he hastened a second time, with about 40 of his people, to the place where the fire raged with the most violence, and in sight of the whole city performed such daring, and, to the people who beheld them, such astonishing feats, that they looked upon them as salamanders, and cried out, that they could live in fire. In truth, it was no uncommon thing to see the boldest and most active among them tumble on the roofs amidst the ruins of the houses which their own efforts had brought down under them. And thus, by their resolution and agility, the fire was very soon subdued, to the astonishment of the Chinese who were spectators of the wonders they performed. On this occasion the Swedish was the only European factory that suffered; yet on my arrival in England, to my no small diversion, I read in the Paris Gazette, that the city of Canton had been almost wholly destroyed; and that, in particular, the English, Dutch, Danish, and Portuguese factories, had been burnt down, and almost all their effects consumed; but that the French factory had providentially escaped, their goods being all shipped before the conflagration reached the quarter allotted for their residence.

This signal assistance gained the Admiral much respect; he was the next day waited upon by the principal inhabitants with presents and thanks; and soon after, a message came from the Viceroy appointing the 30th of November for the day of audience. Being highly pleased with his last intimation, he instantly gave orders for the necessary preparations; and engaged Mr. Flint, a gentleman belonging to the English factory, for his interpreter, who, being trained up from his infancy among the Chinese, spoke their language fluently, and who was not afraid to declare with boldness what the Admiral delivered him in charge, a part which the Chinese interpreters would not have dared to have performed with equal fidelity.

On the day appointed, at 10 o'clock, the Commodore and his retinue set out; and, as he entered the outer gate of the city, he was met by a guard of 200 soldiers, who conducted him to the great parade before the Emperor's palace, in which the Viceroy then resided, where a body of troops to the number of 10,000 were drawn up under arms, who made a fine appearance, being all new clothed for this ceremony. Through the middle of this body the Commodore with his retinue marched to the

the hall of audience, where he found the Viceroy seated under a rich canopy in the Emperor's chair of state, with all his council of Mandarines attending. He was seated the third in order from the Viceroy, the chiefs of the law and treasury being the only persons seated above him. He then, addressing himself to the Viceroy by his interpreter, complained to him of the delays he had met with, the insincerity of those he had employed, the vexatious impositions of the officers of the customs, the grievances of the British subjects, and, finally, the loss sustained by the *Hallingfield* Indiaman, who had arrived there dismasted but a few days before the fire happened, by which the crew had been great sufferers, and the Captain in particular, who had lost a chest of treasure value 4500 tael. To the latter article the Commodore received for answer, that, in settling the Emperor's customs with that ship, the Captain should be considered. To the other complaints, the Commodore received no answer at all. And having now gone through the several articles he had in charge from the company, he entered next upon his own affairs, and particularly concerning the licence to ship off his provisions and stores, which, he said, were all ready, and the season for sailing was now set in. The Viceroy replied to this, that the licence should be immediately issued, and that every thing should be ordered on board the following day. The business being now at an end, the Viceroy continued the conversation for some time on matters of indifference and curiosity; and, after observing that the Centurion had been long on their coast, he concluded with acknowledgments for the services the Commodore had rendered the Chinese nation by the activity of his people at the late fire, and with wishing him a prosperous voyage to Great Britain. Thus happily concluded this long-expected audience; and, in pursuance of the Viceroy's promises, the provisions were begun to be shipped the very next day: and now all the preparations for putting to sea were pursued with so much expedition, that by the 9th the Centurion and her prize were ready to unmoor, and on the 10th passed through the Bocca Tygris into the open road, and on the 12th anchored before the town of Mocao. While they lay here, the Portuguese merchants entered into treaty with the Commodore for the purchase of the prize, for which they would give no more than 6000 dollars, though worth double that sum; but the impatience of the Commodore to be gone, that he might himself be the messenger of his own good fortune, and thereby prevent the enterprizes of the enemy to intercept him, prevailed upon him to conclude the bargain; and, she being delivered on the 15th of December, and the money received, in the afternoon of the same day he hoisted sail, and took his departure for his native home. On the 3d of January he came to an anchor on Prince's Island, in the straits of Sunda, where he staid the best part of five days to wood and water, and on the 8th weighed and continued his course. From this time till the 20th we had foul and stormy weather, so bad that I thought it impossible to meet with such in latitudes so near the Equator; and the wind blowing directly against us, we were driven pretty near the coast of New Holland; and, had it continued blowing from the same quarter, with equal violence, for 48 hours longer, we should have found it difficult to have cleared that coast; but, on the 21st, the wind abated, and the weather became moderate. On the 24th the trade-wind set in, and we then proceeded on our passage with the highest alacrity.

On the 22d of February, at half after four in the morning, I discovered a comet to the eastward, near the horizon, being, as I judged, lately emerged from the sun's rays. Its tail was at this time about 10 deg. in length; but in less than a fortnight it increased and extended itself to near 40 degrees. Its head appeared very large and bright; and, on a nice inspection, I have perceived it when the sun has been about a diameter above the horizon. The next time I observed its distance from the planet Venus to be 26 deg. 50

min. following the order of the planets; but not having instruments proper for taking altitudes without a very obvious sensible horizon, I was prevented from making more satisfactory observations. From this time, till the 6th of March, we had pleasant weather, with few exceptions; but on that and the three following days, being near the Cape of Good Hope, we had some boisterous storms; yet, when we arrived at Table-bay, on the 11th, the Dutch knew not that any such had happened. We found riding here two English East-Indiamen, the *Salisbury* and *Warwick*, each of which saluted us with 13 guns, and we returned 11. We also found five Dutch ships, one of which having, as Admiral, a flag at his main-top-mast-head, saluted us with 9 guns, to which we returned 7. At 11 at night we parted our best bower cable and hawser, both of which were very rotten, and the next day moored again with others purchased from the Dutch. Here the Commodore continued till the beginning of April, highly delighted with the place, and during his stay entered about 40 new men. On the 3d of May, having completed our water and provisions, we on that day weighed and put to sea. On the 19th of April we passed within sight of the island of St. Helena, which, however, we did not visit. On the 26th we caught on board the ship a snake that measured in length six feet and two inches, which our surgeon, on examination, pronounced to be perfectly harmless. It was supposed to be brought on board with our wood, at Prince's Island, in the straits of Sunda. The 30th, being before the wind, with a fine breeze, and a gentle rain, a violent and sudden squall took us a-head, threw all the ship's sails a-back, carried away her fore-top-sail yard, split the fore-sail, the fore-top-sail, the fore-top-gallant-sail, and the mizzen and mizzen-top-sail. During this squall the ship laid down very much, and we were in the utmost danger of our masts coming by the board; but providentially we escaped without further damage.

The 9th of June, in the evening, it being a thick fog, we on a sudden saw a ship close by us; we fired a shot, and brought her to. She proved an English ship from Amsterdam, bound for Philadelphia or Carolina, with Palatine emigrants. She gave us the first notice of a war with France, and proceeded on her voyage. The 10th of June we came into soundings. The 11th, at half past eleven in the morning, we discovered three sail, and at one in the afternoon spoke with one of them, being a Dutch ship from Dublin. At the same time, the second being pretty near us, shewed Dutch colours. The third, who had been in chase of the others the whole day, perceiving we designed to speak with her, stood from us with all the sail she could crowd. We gave chase to her for about three hours, when finding we did not gain upon her, we resumed our former course. On the 12th, in the morning, the fog clearing up, we perceived the Lizard Point: but that the signal perils, which had so often threatened us, and from which we had been more than once providentially delivered, might be discoverable to the last, we were afterwards told that there was a French fleet of considerable force cruising in the chops of the Channel, through the middle of which we had this night sailed without being perceived.

On the 13th, between the Isle of Portland and the Isle of Wight, we saw a ship towing another which was disabled in her masts. This ship proved the *Salamander* privateer, with a French prize. The 14th, at eleven in the morning, we anchored at the back of the Isle of Wight, and in the evening weighed, and again anchored at Spithead. Thus we finished a long and perilous voyage, which had lasted three years and nine months, after having by its events, as Mr. Walter observes, strongly evinced this important truth, "That though prudence, intrepidity, and perseverance, united, are not exempted from the blows of adverse fortune, yet, in a long series of transactions, they usually rise superior to its power, and in the end rarely fail of proving successful."

Having now brought this celebrated voyage to a conclusion,

London Published by Alex. Hogg at the Kings Arms, 32, in Paternoster Row.

and other IMAGES, at the beginning of the Year.
in Sagasaki, the Imperial City of Japan.*

[Faint, illegible handwriting, possibly a list or ledger entry, with some red ink markings.]

conclusion, it may, perhaps, be expected that we should give some account of the Spanish squadron, which we have more than once had occasion to mention, and which was so near intercepting the Commodore at first setting out, that, had the Spanish Admiral cruised to the eastward of the island of Madeira, instead of the westward of it, the two fleets must have certainly met; and, in that case, whatever had been the event of the action, the progress of the voyage must have been effectually prevented.

This squadron was composed of the following ships: the *Asia*, of 66 guns, 700 men, commanded by Don Joseph Pizarro, as Admiral; the *Guipuscoa*, 74 guns, 700 men; the *Hermiona*, 54 guns, 500 men; the *Esperanza*, 50 guns, 450 men; the *Estevan*, 40 guns, 350 men; and a patache of 20 guns, 120 men; and over and above this complement, they had on board an old Spanish regiment of foot, intended to reinforce their garrisons in the South Seas, and to counterbalance the land forces that it was known were intended to be put on board the Commodore.

When this fleet had cruised, as has been said, to the leeward of Madeira, till they were in a manner certain that the Commodore, had either passed by, or deferred his voyage, their Admiral determined to pursue his instructions, and continue his course to the South Seas; but first, it was necessary to steer to the coast of Brazil to recruit his provisions, being victualled only for four months, and more than two of the four being already elapsed.

Accordingly, about the beginning of November, 1740, he quitted his station off the Madeiras, and, on the 5th of January following, arrived at the river of Plate; where coming to an anchor in the bay of Maldonado, he sent immediately to Buenos Ayres for a supply.

While they lay here, they received intelligence, by the treachery of the Portuguese Governor of St. Catherine's, of the Commodore's arrival at that port, and of the weak condition he was then in; but, whatever were his reasons, Pizarro declined making any other use of this intelligence, than hastening his preparations to double the cape, which he hoped to effect before the Commodore was in readiness to follow him. With this view, after refreshing his crew, and recruiting his water, he instantly set sail without waiting for his provisions (which, however, arrived a day or two after he set sail), rightly concluding, that if he got the start of the Commodore in the South Seas, he should not only alarm the coast, but so strengthen the forts against the attacks of the enemy, as effectually to baffle their designs, by depriving them of the means of procuring necessities. But, notwithstanding this precipitation, the Commodore put to sea four days before him, and, in some part of the passage round the Cape, the fleets were so near each other, that the *Pearl*, as has been said, being separated in a storm, ran within gun-shot of the *Asia*, before she found her mistake.

It was with the utmost difficulty, and not without considerable rewards, that the Spanish sailors were prevailed upon to undertake the passage round Cape Horn at that tempestuous season: however, being once engaged, they continued to persevere, till by the latter end of February they had run the length of the Cape, and were turning to the westward, when a storm arose, in which the *Guipuscoa*, *Hermiona*, and *Esperanza*, lost sight of the Admiral, and on the 6th of March the *Guipuscoa* was separated from the other two. On the 7th the storm increased, and by its irresistible violence drove the whole squadron to the eastward, and, after several unsuccessful efforts, obliged them to return to the coast of Brazil, where the *Asia* took shelter in the river of Plate, and about the middle of May was joined by the *Esperanza* and *Estevan*; the *Hermiona* having, as was supposed, foundered at sea, as she was never more heard of, and the *Guipuscoa* being run ashore and sunk on the coast of Brazil. The patache, we should have observed, was condemned before they quitted the coast of Brazil, and her crew distributed among the other ships; so that of the six ships of which this

No. 45.

squadron originally consisted, there now only remained three, and those in a most miserable condition; for, though it does not appear, that the Spaniards were so severely visited with that most fatal disease the sea-scurvy, which carried off so many of the English in this passage, yet they were reduced by famine to such infinite distress, that rats, when they could be caught, were sold for four dollars a-piece; and a sailor, who died on board, had his death concealed for several days by his brother, who during that time lay in the same hammock with the dead corpse, only to receive the dead man's allowance.

In this dreadful situation, they were alarmed by the discovery of a conspiracy among the soldiers on board the *Asia*, to murder the Admiral, and all the ship's crew, originating from no other motive but that of appropriating the whole stock of provisions to the conspirators own proper use. But this plot was prevented, when just upon the point of execution, by means of the priest on board, who, having taken the confession of one of the conspirators as he lay at the point of death, pursued proper measures to defeat their bloody purposes, and to bring three of the ring-leaders to condign punishment.

But, though this combination failed of its effect, there were other distresses that multiplied upon them, and which could not be prevented. Hunger and thirst, the most dreadful of all other calamities, daily became more grievous; the ships grew continually more and more leaky, and the men less able to stand at the pumps; nothing was to be seen but despondency in every countenance; nothing heard but lamentations and complaints, which were embittered by the absolute impossibility of relieving them. Under the weight of these affecting circumstances, the *Asia* was near sinking, when she arrived at Monte Vedio with scarce half her crew alive. The *Estevan*, when she anchored in the bay of Barragan, had in like manner lost about the same number of her hands; but, what was still worse, and is almost incredible, the *Esperanza*, out of a crew of 450 seamen which she brought from Spain, had only 58 that reached the shore, and the whole regiment of soldiers, 60 men only excepted, perished.

Being now in want of all kinds of necessities, masts, yards, rigging, provisions, and money, Pizarro dispatched an express over land to St. Jago, in Chili, to be from thence forwarded to the Viceroy of Peru, desiring a remittance of 200,000 dollars; and what must astonish the reader is, that the Indian who was charged with this dispatch, though in the depth of winter, when the Cordilleras are judged impassable by reason of the snow, was only 13 days in his journey from Buenos Ayres to St. Jago, places distant from each other 300 Spanish leagues. At the same time an advice-boat was sent with a letter of credit to Rio Janeiro, to purchase what was wanting of the Portuguese; but neither the one nor the other of these dispatches succeeded to the wish of the Spanish Admiral. The Viceroy, instead of 200,000 dollars, sent him only 100,000; and the Portuguese, instead of furnishing him with masts and yards, spared him only some pitch, tar, and cordage, with which he was obliged to be contented: but a more mortifying disappointment he had still to suffer; for a carpenter, whom, after the return of the money, he had trusted with a considerable sum, and whom he had sent up into the country of Paraguay to cut masts, instead of prosecuting the business with which he was entrusted, married in the country, and settled out of his reach, refusing to return.

In this dilemma, the only thing that could be done, was, to shift the masts of the *Esperanza* into the *Asia*, and to fit up the *Estevan* with what spare masts and yards they could muster, and with these two ships to hazard a second attempt to double Cape Horn, as it was now summer, and the weather less severe. But a certain fatality seemed to preside over every part of this unfortunate expedition. The *Estevan*, as she was coming down the river Plate, ran on a shoal and beat off her rudder; and the *Asia*, though she proceeded alone

5 A

with

with moderate weather and a favourable gale, yet when she came to the height of Cape Horn, and was tacking to change her course to the westward, by some misconduct in wearing the ship, rolled away her masts, and was a second time forced back to the river of Plate; from whence Pizarro undertook to cross the continent by land, and with some difficulty accomplished his design.

By this time Don Mindinuetta, Captain of the *Guipuscoa*, wrecked, as has been said, on the coast of Brazil, arrived, with those of his crew who escaped, at the place of general rendezvous; and, finding the *Esperanza* without masts, applied a second time to the Portuguese, by whose assistance he completed her repair, and, in 1742, doubled the Cape, and arrived in the South Seas, where he was met by Pizarro, who claimed the command of the *Esperanza*, which Mindinuetta disputing, an irreconcilable quarrel arose between the two Commanders, which the Viceroy of Peru in vain endeavoured to reconcile. In 1745, they both returned over land to the coast of Brazil, where they found the *Asia* still in a shattered condition. This ship, however, they determined to carry to Europe, and, with this view, they fitted her up in the best manner they could; and, having manned her partly with Portuguese, partly with English prisoners, and partly with Spaniards, together with some Indians whom they forced out of the country, they set sail from Monte Vedio for Europe about the beginning of November; but they had not been long at sea before the Indians, eleven in number, formed a conspiracy to destroy the Spaniards, and to regain their liberty, in which they had hopes of being joined by the English and Portuguese, whom the Spaniards used with great insolence. At the head of this conspiracy was their Chief Orellana; and one evening, about nine o'clock, he and his companions came all together on the quarter-deck, and drew towards the door of the great cabin. The boatswain immediately reprimanded them, and ordered them to be gone; on this Orellana spoke to his followers in his native language, when four of them drew off, two towards each gangway, and the Chief and the remaining six seemed to be slowly quitting the quarter-deck. When the detached Indians had taken possession of the gang-way, Orellana placed his hands hollow to his mouth, and bellowed out the war-cry used by those savages. This was the signal for beginning the massacre; accordingly, the six, with their Chief, who remained on the quarter-deck, falling sud-

denly on the Spaniards who were intermingled with them, laid near forty of them at their feet, of which above twenty were killed on the spot, and the rest disabled. Many of the officers, in the beginning of the tumult, pushed into the great cabin, where they put out the lights, and baricaded the door; whilst of the rest, some endeavoured to escape along the gang-ways into the fore-castle, where the Indians placed on purpose stabbed the greatest part of them as they attempted to pass by; others threw themselves into the waste, and thought themselves fortunate to lie concealed amongst the cattle; but the greatest part escaped up the main-throuds, and sheltered themselves either in the tops or the rigging; and though the Indians attacked only the quarter-deck, yet the watch in the fore-castle finding their communication cut off, in the utmost terror likewise gave all over for lost, and in great confusion ran up into the rigging of the fore-mast and bowsprit. But when the Indians had intirely cleared the quarter-deck, the tumult in a great measure subsided; for, not being joined, as they expected, by either the English or Portuguese, they could not pursue their advantage by carrying the disorder into those quarters to which they had driven the Spaniards, who thereby gained time for recollection; and, on finding none concerned in the plot but the Indians, they resolved to attack them in their turn on the quarter-deck. With this view, Pizarro and his officers ventured to half-open the cabin-door, which Orellana attempting to force, was shot dead by Mindinuetta; on which his faithful followers, abandoning all thoughts of further resistance, instantly leaped into the sea. Thus was this insurrection quelled, and the Spaniards suffered afterwards quietly to proceed on their voyage; and, about the beginning of 1746, they arrived safe in Spain, after having been absent between four and five years.

By this unfortunate expedition the naval force of Spain was much weakened: they lost in it 3000 of their best sailors, one whole regiment of veteran soldiers, four stout ships of war, and a patache; for we have observed that the *Hermiona* foundered at sea; the *Guipuscoa* was stranded and sunk on the coast of Brazil; the *St. Estevan* was condemned and broke up in the river of Plate; and the *Esperanza*, being carried into the South Seas, was unable to redouble the Cape, or to return back; so that the *Asia* alone may be regarded as all the remains of that Squadron with which Pizarro first put to sea.

A NEW, AUTHENTIC, and COMPLETE ACCOUNT of
A VOYAGE Round the WORLD,

UNDERTAKEN AND PERFORMED

By Sir FRANCIS DRAKE, in the PELICAN,

HAVING UNDER HIS COMMAND

The Elizabeth, Marygold, Swan, and Christopher Frigates:

Performed in the Years 1577, 1578, 1579, and 1580.

BEFORE we proceed to the relation of the particular Voyages that characterize the navigators who first surrounded the globe, and who immortalized their names by their skill and their courage, it may be expected that we should give some account of their families and first setting out, the distinguished marks of genius that led them to prefer the fatigues and dangers of a sea-faring life to learned ease, or the calm pursuit of less hazardous employments; and that we should trace the steps by which they rose to eminence by their bravery and their conduct.

The bare narration of the incidents recorded in a single voyage, however memorable, would convey but a very imperfect knowledge of the general character of those renowned heroes, who carried the glory of their country to the remotest regions of the earth. We shall, therefore, endeavour to follow them as they advance to fame, and accompany them from their highest elevation to that period when all distinctions are levelled.

The celebrated mariner, of whom we are now to give an account, was son to Edmund Drake, a gentleman of Tavistoke, in Devonshire, who, being inclined to the doctrine of the Protestants, at that time much opposed by Q. Mary, was obliged to quit his place of residence, and retire to Medway, in Kent; where, after that Queen's death, he was first appointed Chaplain in the royal navy, and afterwards Vicar of Upnor. In these employments, his appointments being small, and his family large, he owed the education of several of his children to the kindness of his relations, and that, in particular, of Francis, the eldest of twelve, to Sir John Hawkins; under whom, as it appears, he very early distinguished himself, and laid the foundation both of his fame and his fortune.

The learned Camden, indeed, informs us, that he was put apprentice to the master of a small trading vessel, in whose service he behaved so well, that his master, dying a bachelor, left him his vessel as a reward for his diligence: but Stowe, who seems better informed, represents him in a superior light; tells us, that Francis Russel, afterwards Duke of Bedford, was his godfather; and that Sir John Hawkins was his near relation. What Camden relates of Francis may, however, be true of his brother; for there were no less than four who were bred to the sea.

Be this as it may, the first enterprize of consequence, in which we find him engaged, was in a voyage to the

West-Indies, as Captain of the Judith, under his relation already mentioned. Those islands, having but lately been discovered, and very little frequented by the English, were thought so much to abound in wealth, that no voyager thither could fail of being recompensed with great advantages. Nothing was talked of among the mercantile or adventurous part of mankind but the beauty and riches of the new world. Fresh discoveries were frequently made; new countries and nations, never heard of before, were daily described; and it may easily be concluded, that the relators did not lessen the merit of their discoveries, by suppressing or diminishing any circumstance that might produce wonder, or excite curiosity.

This was the age of enterprize and discovery; and her Majesty encouraged the ardour of her subjects by furnishing ships and commissions to such officers of distinction in her royal navy as were willing to engage in hazardous pursuits.

The projects, however, that were formed, were not always successfully carried into execution; they were frequently defeated by the ignorance of the adventurers, but more often by the malice of the Spaniards, who, from the first discovery of America, considered every other nation that attempted to follow them, as invaders of their rights, and incroachers on their territories. At that time, however, as now, it was no uncommon thing for those who went in search of new discoveries, to carry on a kind of contraband trade with the new settlers; which, though prohibited by the Crown of Spain, was yet countenanced by the Viceroy and Governors; but even these would sometimes take advantage of the power lodged in their hands, and make prize of the profits of the voyage, under pretence of an illicit trade.

Among those who suffered most by the injustice of the Viceroy, was Sir John Hawkins; who, having struck out a new trade, highly advantageous to the parties concerned, though disgraceful to humanity, supplied the Mexican Spaniards with slaves from Africa, and received from them, in return, large remittances in gold and silver. This was connived at, though we do not find that it was absolutely tolerated by the Spanish court.

It was, however, after one of those successful voyages, in which we find two of the Queen's ships engaged (namely, the *Jesus*, commanded by Hawkins, as

Admiral;

Admiral; and the *Minion*, of which Captain John Hampton was Commander; with four other armed trading ships, (among which was the *Judith*, Captain Drake), that, being driven by stress of weather into the port of St. John d'Ulloa, in the bay of Mexico, they were there waiting for a supply of provisions, when the Spanish fleet from Europe arrived, consisting of 12 sail, richly laden with European merchandize, and on board of which was a new Viceroy.

As the port was then absolutely in the power of the English, it was debated, among the principal officers, whether the Spanish fleet should be suffered to enter; as their Admiral suspected, that, if they were admitted, they would contrive some means of distressing him; and if they were not, they must perish at sea; an event that would certainly bring on a war,—a consequence he could by no means justify.

Upon mature deliberation, it was, therefore, judged safest to propose an agreement with the Viceroy, to which he consented, and by which it was stipulated, that the English should hold one side of the harbour, and the Spaniards the other; and that hostages should be given on both sides, that no injury should be done to either. But it was soon discovered, that, though on the part of the English, six gentlemen were sent, yet, on that of the Spaniards, the hostages were only common men, finely dressed. This gave cause of distrust; yet the English, naturally honest, were not sufficiently on their guard.

The Spaniards for some weeks behaved with seeming cordiality; mutual civilities passed between the officers of both nations; and the English having supplied their wants, were preparing to depart, when, all of a sudden, at a signal given, the Spaniards assaulted their ships as the officers were at dinner, boarded the *Minion* by a concealed ambuscade, which, however, was repulsed with loss, and then a general massacre ensued. The English who were on shore were all put to death; three of the four trading ships were presently sunk; and the *Minion* and *Jesus* were so embarrassed by their moorings, that it was almost a whole hour before they could be placed in a posture of defence; which, however, was at last effected. They then returned the attack with so much fury, that the Spanish Vice-Admiral was soon blown up, and in her perished 300 men; and not long after the Spanish Admiral himself was sunk. The Spaniards, in revenge, set two of their ships on fire to burn the *Minion* and *Jesus*, the first of which set sail and escaped; but the *Jesus*, after shifting her crew on board the *Judith*, fell a victim with the rest to Spanish treachery.

In the night, the *Judith* having made her escape, endeavoured, but in vain, to join the *Minion*; and being only a bark of 50 tons, alone, on a hostile coast, crowded with men, and having only provisions on board for her own slender crew, a mutiny arose among the mariners, and by far the greatest number insisted on being put on shore, chusing rather to take their chance among the savages, than to remain on board to starve at sea, or again to fall into the power of the merciless Spaniards.

Accordingly, Captain Hawkins, gave every man his choice, either to land on the continent, or sail with him, and share his fate. About 100 of the stoutest seamen chose the former; of whom five only lived to return to England. These gave an account, that, on their landing, the natives, mistaking them for Spaniards, fell upon them suddenly, and killed eight of their number; that, after they were known to be enemies to the Spaniards, they were used with kindness; that, however, being tired of living among savages, they agreed to part, and seek the means of returning home; some directed their course to the northward, and watched the opportunity of seizing a small vessel, and, crossing the Gulph, traversed an immense tract of land, till they arrived at a French settlement in the North; of those who travelled westward, which was by far the greatest part, sixty-five fell into the hands of the Spaniards, and suffered various torments from the Inquisition, three were burnt alive, and two only survived to

reach their own country. Of those who followed the other course, five found means, after enduring incredible hardships, to get to Nova Scotia, of whom three were brought safe to England in French merchant ships.

It was in the above engagement that Captain Drake first distinguished himself; and to this judicious conduct, that those who escaped from the *Jesus* owed their preservation. The *Judith* had the good fortune to arrive safe in England, having purchased some provisions on the Island of Cuba; but what became of the *Minion* we have not been able to learn.

In this expedition Sir John Hawkins lost an immense sum. It was in vain to make complaint to his sovereign of the infraction of the peace. The Spanish minister vindicated the injustice of the Viceroy; and the Queen, tho' she secretly repented the loss of her ships, could not openly abett the illicit trade carried on by her servants.

Drake, who shared in the misfortune of his relation, possessed both his spirit and his industry. He did not sit down to lament the loss he had sustained; but, having acquired some degree of credit by his gallant behaviour, and some knowledge of the weakness and wealth of his enemies, he determined to profit by his losses, and to make reprisals whenever a fair opportunity should offer.

It was no difficult matter to engage new adventurers in new projects in those early days of Mexican commerce, and Drake was not long before he raised a fund to begin trade on a new footing. In 1570 he made his first expedition, chiefly on his own account, with two ships, the *Dragon* and the *Swan*; and the next year in the *Swan* alone; in both which voyages he enlarged his experience, but it does not appear that he repaired his loss.

In 1572 he found means, however, to fit out a much greater force, in order to carry into execution an enterprise which he had meditated, not only to reinstate his fortune, but to revenge the treachery of his enemies.

About this time war was agitating between England and Spain, to which it must be confessed the illicit trade carried on to the Spanish settlements not a little contributed. He, therefore, set sail from Plymouth in the *Pascha*, a letter of marque ship, of 70 tons, accompanied by the *Swan* of 50 tons, the command of which he entrusted to his brother John; in both which ships he had embarked 73 choice men, with a year's provisions, and such warlike stores and ammunition as he judged necessary for the enterprise he had in view. He had, likewise, the precaution to take with him the frames of two or three small pinnaces, that, if any accident should befall either of his larger ships, he might have it in his power to preserve the crew without being driven to the necessity of leaving any of them behind; a precaution which experience had taught him in the unfortunate voyage of his kinsman Sir John. But this was not the only use for which he foresaw these small vessels would be wanted, as will appear in the sequel.

With this warlike force, inconsiderable as it may now appear, he cleared the land of England on the 12th of May, 1572; and, the weather continuing fair, and the wind favourable, on the 29th of June he passed between Dominica and Guadaloupe, and on the 6th of July came in sight of the high land of Santa Martha; then continuing his course to the southward, on the 15th of the same month both ships arrived at Port Pheasant, which lay at a convenient distance from Nombre de Dios, the place of their destination.

Here he proposed to build his pinnaces, and was going ashore with a few men unarmed; when, discovering a smoke at a distance, he made the signal for another boat to follow him with an armed force. Being joined by this reinforcement, he marched towards the fire, where he found a plate of lead nailed to a tree, with an inscription engraven upon it by one Garret, an Englishman, who had left that place a day or two before, and had taken that method of informing him that the Spaniards

niards had been advertised of his intended visit, and of his rendezvous at that port; and that, therefore, it would be prudent for him to make but a very short stay.

Drake, surprized, no doubt, at the news, but at the same time knowing how convenient this place was for his designs, and considering that the hazard, and waste of time, which could not be avoided in seeking another station, was equivalent to any other danger which was to be apprehended from the Spaniards, determined to follow his first resolution; only, for his greater security, he ordered a kind of pallisade or fortification to be made, by felling a number of large trees, and laying the trunks and branches one across another, on an elevated spot that commanded the river. This done, he set the carpenters to work; and while they were employed in putting the frames of the pinnaces together, one Captain Rausse happened to touch at the same port, with a bark of 50 men. To Rausse, Drake imparted his design; and, when the pinnaces were ready, both set sail together, shaping their course to Nombre de Dios. They touched at the Island of Pines, where they were informed, by the negroes they found there, that the inhabitants of that place were in daily expectation of some soldiers, which the Governor of Panama had promised to send, to defend them from the Symérons, or fugitive negroes, who, having escaped from the tyranny of their masters, had settled themselves under two kings, or leaders, on each side of the passage between Nombre de Dios and Panama; and not only asserted their natural right to liberty and independence, but endeavoured to revenge the cruelties they had suffered, and had lately put the inhabitants of Nombre de Dios into the utmost consternation. These negroes the Captain set on shore on the main land, so that they might, by joining the Symérons, recover their liberty, or at least might not have it in their power to give the people of Nombre de Dios any speedy information of his intention to invade them. Then, selecting 53 men from his own company, and 20 from the crew of his new associate Captain Rausse, he embarked with them in his new pinnaces, and set sail for Nombre de Dios.

On July the 28th, at night, he approached the town undiscovered, and dropt his anchors under the shore, intending, after his men were refreshed, to begin the attack; but, finding that they were terrifying each other with formidable accounts of the strength of the place, and the multitude of the inhabitants, he determined to hinder the panic from spreading farther, by leading them immediately to action; and, therefore, ordering them to their oars, he landed without any opposition, there being only one gunner upon the key, though it was fortified by six brass cannon of the largest size. But the gunner, while they were employed in throwing the cannon from their carriages, alarmed the town, as they soon discovered by the bells, the drums, and the noise of the people.

Drake, leaving twelve men to guard the pinnaces, marched into the town with little or no opposition. After a short skirmish, the forces that the alarm had hastily drawn together were soon dispersed, except a few whom he detained as prisoners, in order to shew him the Governor's house, and also the store-house, where the mules that bring the silver from Panama were unloaded.

Being now in full possession of the town, he posted the main of his small body under the command of his brother, in the market-place; and then followed the guides, with the rest, to the store-house; where, forcing the door, and entering the room where the silver was deposited, they found it heaped up in bars, in such quantities as almost exceed belief, the pile being, as they conjectured, seventy feet in length, ten in breadth, and twelve in height, each bar weighing between thirty and forty-five pounds. It is easy to imagine, that, at the sight of this treasure, nothing was thought of, by the English sailors, but by what means it might best be conveyed to their boats; and, doubtless, it was not easy for

Drake (who, considering their distance from the shore, and the number of their enemies, was afraid of being intercepted in their retreat) to hinder his men from encumbering themselves with so much silver as might have retarded their march, and obstructed the use of their weapons; however, by promising to lead them to the King's treasury, where there were gold and jewels to a far greater value, and where the plunder was not only more portable, but nearer the shore, he persuaded them to follow him (not, however, without every man his bar), and rejoin the main body in the market-place. Here he found his little troop much discouraged by the apprehension that, if they stayed any longer, the enemy might gain possession of their pinnaces, and that they should then, without any means of safety, be left to stand alone against the whole force of that country. Drake, not indeed easily terrified, but sufficiently cautious, sent to the harbour to examine the ground of their fears, and to learn if the same panic had taken possession of the men whom he had left to guard his boats; but, finding no foundation for these dreadful apprehensions, he persisted in his first design, and led the troop forward to the royal treasury. In their way there fell a violent shower of rain, which wet some of their bow-strings, and extinguished many of their matches (spring-locks for muskets not being then invented); a misfortune which might soon have been repaired, and which, perhaps, the enemy might suffer in common with them; but which, however, on this occasion, very much embarrassed them, as the delay produced by it repressed that ardour which, sometimes, is only to be kept up by continual action.

It was in vain for Drake to expostulate, or to represent the disgrace of returning in rags, after having the chief treasure of the world within their power; he therefore reproached their cowardice, set before their eyes the imminent danger to which they would inevitably be exposed, if they failed to behave like men anxious for glory, and zealous for the honour of their country. Animated by these incentives, they resumed their former spirit, and, pushing briskly forward, the whole company followed till they arrived at the treasury, which they instantly forced. Having thus far succeeded, Drake committed the care of the riches to his brother, and Oxenham, of Plymouth, (a man known afterwards for his bold adventures in the same parts) while he, with the main body, should again return and reconnoitre the market-place, and disperse any parties of the Spaniards that might be forming into a body to oppose their progress. With this view, as he was advancing, his strength suddenly failed him, and he fell down speechless.

Then it was that his companions perceived a wound in his leg, that he received in the first rencounter, but hitherto concealed, left his men, easily discouraged, should make their concern for his life a pretence for returning to their boats. Such, however, had been his loss of blood, as was discovered upon nearer observation, that it had filled the prints of his footsteps; and it appeared scarce credible, that, after such an effusion, life should remain. The bravest were now willing to retire; neither desire of honour, or of riches, was thought to prevail in any man over his regard for his leader.

Drake, whom cordials soon restored to his senses, was the only man who could not be prevailed on to leave the enterprize unfinished. It was to no purpose that they advised him to submit to go on board to have his wound dressed, and promised to return with him to compleat their design. He well knew how impracticable it was to regain the opportunity when it was once lost, and could easily foresee that a respite of but a few hours would enable the Spaniards to recover from their consternation, to assemble their forces, reftit their batteries, and remove their treasure. What he had undergone so much danger to obtain, was now in his hands, and the thoughts of leaving it untouched was too mortifying to be patiently borne; however, as there

was little time for consultation, and the same danger attended their stay in that perplexity and confusion, as their return, they bound up his wound with his scarf, and, partly by force, partly by intreaty, they carried him back to the boats, in which, with what treasure they were able to bring off, they all embarked by break of day. Then taking with them, out of the harbour, a sloop laden with wines, they went to the Bastimento's, an island about a league from the town, where they staid two days, to recover the wounded men who had been hurt in the first rencounter, and to regale themselves with the wines they had taken, and with the fruits that grew in great plenty in the gardens of that island.

During their stay here, there came over to that island a Spanish gentleman, sent by the Governor with instructions to enquire whether the Captain was that Drake who had before been on their coast; whether the arrows with which many of their men were wounded were not poisoned; and whether they wanted provisions or other necessaries? The messenger, likewise, extolled their courage with the highest encomiums, and expressed his admiration of their daring undertaking. Drake, though he knew the civilities of an enemy are always to be suspected, and that the messenger, amidst all his professions of regard, was no other than a spy, yet knowing that he had nothing to apprehend, treated him with the highest honours that his condition admitted of. In answer to his inquiries, he assured him, that he was the same Drake with whose character they were before acquainted; that he was a rigid observer of the laws of war, and that he never permitted the arrows discharged by his followers to be poisoned. He dismissed him with considerable presents; and told him, that, though he had in part failed in this attempt, he would never desist from his design of revenging the treachery of the Viceroy of Mexico, till he had shared with Spain the treasures of America.

He then resolved to return to the Isle of Pines, where they had left their ships, and to consult about the measures they were now to take; and, having arrived on the 1st of August at their former station, they dismissed Captain Raufe, who, judging it unsafe to stay any longer on the coast, desired to be no farther engaged in their designs. But Drake, not to be diverted from his purpose, after being cured of his wound, inquired of a negroe, whom he took on board at Nombre de Dios, the most wealthy settlements, and weakest parts of the coast, who advised the attack of Carthagena. This the Admiral seemed to approve: and, setting sail without loss of time, came to anchor, August 13, between Charecha and St. Barnard's, two islands at a little distance from the harbour of Carthagena. Then passing with his boats round the island, he entered the harbour, and in the mouth of it found a frigate with only an old man in it, who voluntarily informed him, that, about an hour before a pinnace had passed by, with sails and oars, and all the appearance of expedition and importance; that, as she passed, the crew on-board her bid him take care of himself; and that, as soon as she touched the shore, he heard the noise of cannon, fired as a warning, and saw the shipping of the port drawn up under the guns of the castle. The Captain who had himself heard the discharge of the artillery, was soon convinced that he was discovered; and that, therefore, nothing could be attempted there with any probability of success. He therefore contented himself with taking a ship of Seville of 240 tons (which the relator of this voyage mentions as a very large ship), and two small frigates, in which he found letters of advice from Nombre de Dios, intended to alarm that part of the coast.

Drake, now finding his pinnaces of great use, and not having a sufficient number of sailors for all his vessels, was desirous of destroying the Swan, the ship commanded by his brother; that the others might be better manned. This, necessary as it was, could not easily be done without disingling his company; who,

having made several prosperous voyages in that vessel, would naturally be averse to her destruction.

Drake knew that nothing but the love of their leaders could animate his followers to encounter such hardships as he was about to expose them to; and, therefore, rather chose to bring his designs to pass by artifice than by authority. He sent for the carpenter of the Swan, took him into his cabin, and, having first engaged him to secrecy, ordered him in the middle of the night, to go down into the well, and bore three holes through the bottom, laying something against them that might hinder the bubbling of the water from being heard. To this the carpenter, after some expostulation, consented, and the next night performed his promise. In the morning, August the 15th, Drake, going out with his pinnace a fishing, rowed up to the Swan; and, having invited his brother to partake of his diversion, inquired, with a negligent air, why the Swan was so deep in the water? Upon which, his brother, being alarmed, sent down his steward to learn the cause, who returned immediately, with an account that the ship was leaky, and in danger of sinking in a very little time. They had instantly recourse to the pump; but, having laboured for five hours, and gained very little upon the water, they willingly, according to Drake's advice, set the vessel on fire, and went on board the Pascha.

Finding it now necessary to lie concealed for some time, till the Spaniards should forget their danger, and remit their vigilance, they set sail for the Sound of Darien, and, without approaching the coast, that their course might not be observed, they arrived there in six days.

This being a convenient place for their reception, both on account of privacy, it being out of the road of all trade, and as it was well supplied with wood, water, wild-fowl, hogs, deer, and all kind of provisions, he stayed here fifteen days, to careen his vessels, and refresh his men, who worked interchangeably, on one day the one half, and on the next day the other half.

On the 5th of September, Drake left his brother with the ship at Darien, and set out with two small vessels towards the Rio Grand, which they reached in three days, and on the 9th of the same month were discovered by a Spaniard from the land, who believing them to be his countrymen, made a signal for them to come on shore, with which they very readily complied; but he, soon finding his mistake, abandoned his plantation, where they found great plenty of provisions, with which having laden their vessels, they departed.

In the mean time, his brother, Captain John Drake, went, according to the directions that had been left him, in search of the Symcerons, or fugitive negroes, from whose assistance they now entertained hopes of completing the success of their voyage; and, touching upon the main land, by means of the negroes whom they had taken from Nombre de Dios, engaged two of the Symcerons to come on board his ship, leaving two of his own men as hostages for their safe return. Those men, having assured him of the affection of their nation, appointed an interview between Drake and their leaders. With this appointment Drake being made acquainted, he immediately quitted Port Plenty, so named by the English from the great store of provisions they had amassed at that place, and came, by the direction of the Symcerons, into a secret bay, among beautiful islands covered with trees, which concealed their ships from observation, and where the channel was so narrow and rocky that it was impossible to enter it by night; so that there was no danger of a sudden surprize. Here they met, and entered into engagements, which common enemies and common dangers preserved from violation. But the first conversation informed the English that their expectations were not immediately to be gratified: for, upon their enquiries after the most probable means of acquiring gold and silver, the Symcerons told them, that had they known

known sooner the chief end of their expedition, they could easily have gratified them; but that during the rainy season, which was now begun, they could not recover the treasure, which they had taken from the Spaniards, out of the rivers in which they had concealed it. Drake, therefore, proposing to wait in this place till the rains were passed, built with the assistance of the Symérons, a fort of earth and timber; and, leaving his brother and part of his company with the Symérons, set out with three pinnaces towards Rio de la Hacha, being of a spirit too active to lie still patiently, even in a state of plenty and security, and with the most probable expectations of immense riches.

In their way thither, they anchored within sight of Cartagena without landing, and on the 17th of October took a Spanish bark, with which they entered the harbour in disguise; but were soon accosted by a Spanish gentleman whom they had sometime before taken and set at liberty; who coming to them in a boat, as he pretended, without the knowledge of the Governor, made them great promises of friendship, and professions of esteem. But Drake, having waited till next morning without receiving the information he had been encouraged to expect, found that all this pretended kindness was no more than a stratagem to amuse him, while the Governor was raising forces for his destruction.

This appeared more clearly on the 20th, when two frigates, well armed and manned, came out in the night with a view to surprize the pinnaces, and make prisoner of Drake: but these being discovered, and their design frustrated, Drake, when day-light approached, leapt intrepidly ashore single, in defiance of their troops, which hovered at a distance in the woods and on the hills, without ever venturing to advance within reach of the shot from the pinnaces. To leap, however, upon an enemy's coast, in sight of a superior force, only to shew how little they were feared, was an act that in these times would meet with little applause: but motives of policy might influence the conduct of Drake, and make that necessary then, which now appears a ridiculous bravado. Finding the whole country advertised of his attempts, and in arms to oppose him, he might make a feint only of landing to increase their fears, and encourage their alarms, that they might keep together till he should assault them in their deserted posts; a stratagem which there is reason to think he put in practice, as he continued upon the coast till one of his vessels had only a garbun of bacon and a small quantity of bread on board for seventeen men, and till there was on board his own vessel even a greater scarcity. But resolution and success reciprocally produce each other. They had not failed more than three leagues on their return to their ships before they fell in with and attacked a coasting vessel, which after some resistance they took, and happily found it laden with excellent provisions. He now determined to return to the Symérons, with whom, as has been said, he left his brother, and part of his force; and to attempt, by their assistance and direction, to make his way over, and invade the Spaniards in the inland parts, where they would probably never dream of an enemy.

When they arrived at Port Diego, so named from the negroe who had procured them their intercourse with the Symérons, they found Captain John Drake and one of his company dead, being killed in attempting, almost unarmed, to board a frigate well provided with all things necessary for its defence. The Captain was unwilling to make the attack, and represented to his company the madness of their proposal; but, being overborne by their clamours and importunities, to avoid the imputation of cowardice, complied to his destruction.

But this was not the only misfortune that befel this little company; for soon after many of them fell ill of the calenture, a malignant fever, very frequent in the hot climates, which carried off, among several others, Joseph Drake, another brother of the Commander.

While Drake was employed in the recovery of the sick, the Symérons, who ranged the country for intel-

ligence, brought him an account that the Spanish fleet was arrived at Nombre de Dios, the truth of which was confirmed by a pinnace which he sent out to make observations. This, therefore, was the time for their journey; when the treasures of the American mines were to be transported from Panama over land, to Nombre de Dios. He, therefore, by the direction of the Symérons, furnished himself with all things necessary; and, on the third of February in the following year, set out from Port Diego. Having lost already twenty-eight of his company, and being under the necessity of leaving some to guard his ship, he took with him only 18 English and 30 Symérons, who not only served as guards to shew the way, but as purveyors to procure provisions.

They carried with them arrows for war, and arrows for hunting and fowling, the heads of which are proportioned in size to the game they are pursuing. For oxen, stags, or wild boars, they have arrows or javelins with heads weighing a pound and half, which they discharge near hand, and which scarcely ever fail of being mortal. Their second sort are about half as heavy as the other, and are generally shot from their bows; these are intended for smaller beasts. With the third sort, of which the heads are an ounce in weight, they kill birds. As this nation is in a state which does not set them above continual cares for the immediate necessities of life, he that can temper iron best is among them most esteemed; and, perhaps, it would be happy for every nation, if honours and applauses were as justly distributed, and he were most distinguished whose talents were most useful to society.

Every day by sun-rising they began to march, and having travelled till ten, rested near some river till twelve; then travelling again till four, they reposed all night in huts, or wigwams, which the Symérons had either left standing in their former marches, or very readily erected for them, by setting up three or four posts in the ground, and laying poles from one to another, in the form of a roof, which they covered with palmetto boughs and plantain leaves. In the vallies, where they were sheltered from the winds, they left three or four feet next the ground open; but, on the hills, where they were more exposed to the chill blasts of the night, they thatched them close to the ground, leaving only a door for entrance, and a vent a-top in the middle for the smoke of the fire to escape.

In their march, they met not only with plenty of fruits upon the banks of the rivers, but with wild swine in abundance, of which the Symérons without difficulty killed, for the most part, as many as were wanted. One day, however, they found only an otter, and were about to dress it; at which Drake expressing his wonder, was asked by Pedro, the chief Symeron, "Are you a man of war, and in want, and yet doubt whether this be meat that hath blood in it?" For which Drake in private rebuked him, says the relator; whether justly or not, it is not very important to determine; only it shews the genius of the times when superstition prevailed, and when the greatest men were not wholly exempt from its influences.

On the third day of their march, and the 6th of February, they came to a town of the Symérons, situated on the side of a hill, and encompassed with a ditch and a mud wall, to secure it from any sudden surprize. Here they lived with great neatness, and in plenty; and with some observation of religion, paying great reverence to the cross; a practice which, the relator says, Drake prevailed upon them to change for the use of the Lord's Prayer; which however, in so short a stay, is very unlikely. Indeed, it is added, that here they strongly importuned Drake to prolong his abode, promising to double his force; but he, either thinking greater numbers unnecessary, or fearing, that, if any difference should arise between them and his own men, he should be overborne by numbers, he prudently declined their invitation, and their offer of additional assistance, and that in such terms as expressed his eagerness to engage, and his confidence of success from the bravery of his followers.

The Symerons continued to conduct him on his journey, and led him through rural shades and lofty woods, which sheltered his people so effectually from the sun, that their march was less toilsome than if they had travelled in England during the heat of summer. Four of the Symerons that were acquainted with the way, went about a mile before the main body, and cut off branches as marks to direct them, for there was no beaten track; then followed twelve Symerons, after whom came the English, with the two leaders; and the other Symerons closed the rear. In this order, on the 11th of February, they arrived at the top of a very high hill, on the summit of which grew a tree of a wonderful height and magnitude, in which they had cut steps for the more easy ascent to the top, where there was a kind of alcove, to which they invited Drake, and from thence shewed him not only the North Sea, from whence they came, but the great Pacific Ocean, on which no English vessel had ever yet sailed. This prospect exciting his natural curiosity and ardour for adventures and discoveries, he lifted up his hands to God, and implored his blessing upon the resolution which he that instant formed of sailing in an English ship on that immense sea.

From this stupendous mountain they descended, after having feasted their eyes with the grandest prospect the earth can furnish; and in two days came into an open level country, where their march was incommenced with the grass, which is of a peculiar kind, consisting of a stalk like that of a bull-rush, and a blade on which the oxen and other cattle feed till it grows too high for them to reach: then it is that the natives set the whole on fire; and it is no uncommon thing to behold vallies of immense extent in a blaze at once; from whence the cattle fly in the utmost terror, and many perish by the sudden conflagration. It might be supposed, that this burning of the soil, would, in a hot climate, check the powers of vegetation, and that it would be years before the earth could recover its fertility; but it is just the contrary; the ashes of the reeds are hardly extinguished before a new verdure begins to appear; and before a month is elapsed, the whole valley, beheld at a distance, looks as green as ever; so astonishingly wonderful are the powers of Nature on this happy soil!

When they had arrived within a convenient distance of the road from Panama, they posted themselves in a grove or wood, near which the treasure was to be conveyed from thence to Nombre de Dios. They then dispatched a trusty Symeron, in the habit of a slave, properly instructed, to learn on what day the mules, on whose backs the treasure is carried, were to set out. The man was so well qualified for the service, and so industrious in the prosecution of it, that he soon returned with an account, that the treasurer of Lima, intending to embark for Europe, would pass the night following with eight mules laden with gold, and one with jewels; that it was their custom to travel by night, and to rest in the day, to avoid the heat; and that Venta Cruz was to be their first stage.

On this intelligence, they changed their situation, and immediately directed their march towards Venta Cruz, sending, for security, two Symerons, habited as before, to examine the way, who, as they passed along, perceived, by the scent of a match, that some Spaniard was before them; and creeping silently forward, surprized a soldier asleep upon the ground. They bound him, without offering any other violence, and brought him to Drake, who, upon enquiry, found that their spy had not deceived them in his intelligence. The soldier, having informed himself of the Captain's name, conceived such a confidence in his well-known clemency, that, after having made an ample discovery of the treasure that was now at hand, cautioned them likewise against being deceived by the recoes, or carriers, from Nombre de Dios, who met the others by the way, and who were hourly expected, with merchandize and provisions, but without any gold. He closed his examination with an humble petition to Drake, that, when the expected treasure should fall into his hands, he would

be graciously pleased to allow him as much of it as would maintain himself and his children during the remainder of their lives, since there would abundantly more arrive than he and his company could carry away. Drake agreed to his request, upon condition that he led him to a place of secrecy, where he could conceal his men till the time of action, and where there was no danger of the mules passing by without being perceived. This the man did; and Drake placed his ambush accordingly.

Before the time expected, the men were properly refreshed and instructed. Oxenham was appointed to head the Symerons, assisted by Pedro their leader; and Drake was to command the English. The parties were then divided; the English took the right of the way in front, and the Symerons the left at a small distance in the rear. In this manner they were posted, that one company might be in readiness to seize the hindmost mule at the same time that the other had seized the foremost; for the mules, it seems, being tied together, travel in a line, and are all guided by leading the first.

Every thing being now as well concerted as human prudence could direct, and the critical moment of action soon expected, they lay down and covered themselves in the grass, at about eighty or ninety paces distance from the road, that the noise of their breathing might not be heard by the guard that conveyed the treasure.

They had not been more than an hour in this situation, when the bells of the mules on the left, coming from Venta Cruz, began to be heard: but previous orders having been given to meddle only with those from Panama, those from Venta Cruz were suffered to pass unmolested. Unfortunately, however, it happened, that one Robert Pike, being heated with liquor, prevailed upon the man that was next him to creep forward with him, in order to be in readiness to signalize themselves, by being the first to seize the mules from Panama. At that instant, an officer, who accompanied the recoes from Venta Cruz, perceiving white moving in the grass (for Drake had ordered all his company to put their shirts over their cloathes, to distinguish them in the night), took the alarm, and, from a walk, was observed to push his horse forward on a smart trot; and, before he had passed the hindmost ambush, he was heard to ride along in a full gallop; but neither Drake, who commanded the English, nor Oxenham, who headed the Symerons, being apprized of the reason, had any thought of taking measures to intercept his journey.

It was not, however, long before the recoes from Panama came up, and were eagerly seized by the English in front, and secured by the Symerons, as had been agreed upon, in the rear; but, to their great mortification, they found two of them only loaded with silver, and the rest with provisions, six of those from Panama, which carried the valuable burdens of gold and jewels, being ordered back, and the like number that came from Venta Cruz sent forward in their room. The drivers were brought immediately to the Captain, and examined, who informed him, that a horseman who met them riding in haste had talked with the treasurer, and advised him to send back his gold and jewels, and suffer those only to proceed that were now in his [Drake's] power, that he might, by that cheap experiment discover whether there was any ambush in the way.

That Drake was not less enraged than his followers at this disappointment cannot be doubted; but there was now no time to be spent in complaints. The whole country, he knew, would soon be alarmed, and all the force of the Spaniards assembled to overwhelm him; he had no fortress to retire to; every man was his enemy; and every road better known to the Spaniards than to himself. This was an occasion that demanded all the qualities of an hero, an intrepidity never to be shaken, and judgment never to be perplexed. He immediately considered all the circumstances of his present situation, and found that it afforded him only the choice of marching back by the same way through which he came, or forcing his passage through Venta Cruz. He foresaw many

many difficulties in marching back, besides the hazard of having his ships seized before his return; he, therefore, determined to pass forwards to Venta Cruz, before the enemy could be prepared to oppose him. He asked Pedro the leader of the Symerons, whether he was resolved to follow him? and, after having received from him the strongest assurance that nothing should separate them, commanded his men to refresh themselves, and prepare to set forwards. When they came to the gates of the town, they dismissed the mules they had made use of to carry their prize, and continued their march with as little noise as possible; yet they discovered that the alarm had been spread, and the forces of the town hastily drawn together, to oppose their entrance. Drake, who was not unacquainted with the behaviour of that kind of military, received their first onset, and then breaking in upon them, drove them before him without farther opposition, and was seconded by the Symerons, who could not be restrained from making plunder of the town: but Drake hastened in person to the Spanish ladies, and assured them that no injuries should be offered to them; so inseparable is humanity from true courage.

Having thus broken the spirits, and scattered the forces of the Spaniards, he continued his march to the ships without any apprehension of danger, yet with great speed, being very solicitous about the state of the crew; so that he allowed his men, harassed as they were, but little time for sleep or refreshment; but by kind exhortations, gentle authority, and a cheerful participation of all their hardships, prevailed upon them to bear without murmur, not only the toil of travelling, but, on some days, the pain of hunger. In this march, he owed much of his expedition to the assistance of the Symerons, who, being accustomed to the climate, and naturally robust, when any of the English fainted by the way, two of them would carry him between them for miles together. Nor was their valour less than their humanity, after they had learned from their English companions to despise the fire-arms of the Spaniards.

When they were within five leagues of the ships, they found a town built in their absence by the Symerons, at which Drake consented to halt, sending a Symeron to the ships with his gold toothpick as a token, which, though the master knew it, was not sufficient to gain the messenger credit, till, upon examination, he found that the Captain, having ordered him to regard no message without his hand-writing, had engraven his name upon it with the point of his knife; he then sent the pinnace up the river, which they met, and afterwards sent to the town for those whose weariness had made them unable to march farther.

On February the 23d, the whole company was reunited; and Drake, whose good or ill success never prevailed over his piety, celebrated their meeting with thanks to God.

Drake, not yet discouraged, soon turned his thoughts to new projects; and, without languishing in melancholy reflections upon past miscarriages, employed himself in forming schemes for repairing them. Eager of action, and acquainted with man's nature, he never suffered idleness to infect his followers with cowardice; but kept them from sinking under any disappointment, by directing their attention to some new enterprize.

Upon consultation with his own men, and the Symerons, he found them divided in their opinions; some declaring, that, before they engaged in any new attempt, it was necessary to increase their stores of provisions; and others urging that the ships, in which the Spanish treasure was embarked, should be immediately attempted. The Symerons proposed a third plan, and advised them to undertake another journey over-land, to the house of one Pezoro, near Veragua, whose slaves brought him every day more than 200 pounds sterling from the mines, which he heaped together in a strong stone house, that might, by the help of the English, be easily forced. But Drake, being unwilling to fatigue

his followers with another journey over land, determined to steer a middle course between these variable opinions; and, manning his two pinnaces, the Bear and the Minion, he sent John Oxenham in the Bear towards Tolu, to seek provisions; and went himself in the Minion to the Cabezas, to endeavour to intercept the treasure that was to be transported from Veragua and that coast, to the fleet at Nombre de Dios; first dismissing with presents those Symerons who desired to return to their wives, and ordering those that chose to remain with him to be kindly entertained. Drake took at the Cabezas a frigate of Veragua, the pilot of which informed him, that there was in the harbour of Veragua a ship freighted with more than a million of gold; to which he offered to conduct him, being well acquainted with the soundings, if he might be allowed his share of the prize; so much was his avarice superior to his honesty.

Drake, after some deliberation, complying with the pilot's conditions, sailed towards the harbour; but had no sooner entered the mouth of it than he heard the report of artillery, which was answered by others at a greater distance; upon which the pilot told them that they were discovered, this being the signal appointed by the Governor to alarm the coast.

Drake now thought it convenient to return to the ships, that he might enquire the success of the other pinnace, which he found with a frigate that she had taken with twenty-eight fat hogs, 200 hens, and a great store of maize or Indian corn. The vessel itself was so strong and well built, that he fitted it for war, determining to make a second attempt on Nombre de Dios.

On March the 21st, he set sail with the new frigate and the Bear towards the Cabezas, at which he arrived in little more than two days, and found there one Totu, a Frenchman, with a ship of war. Having supplied his ship with water, and other articles of which he was in want, the Captain desired to join the Admiral in his new attempt, to which Drake consented, and admitted him to accompany him with 20 of his men, stipulating to allow them a proportionable share of whatever booty they should acquire: yet they were not without some suspicions of danger from this new ally, he having eighty men, and they being now reduced to thirty-one. Manning, however, the pinnaces, they set sail for Rio Francisco, at which place they arrived on the 29th of March. Here they landed: and, having dismissed their pinnaces for fear of discovery, and ordered them to repair to the same place on the 4th day following, they began their march through the woods towards Nombre de Dios, and continued it with such silence and regularity as surprised the French, who did not imagine the Symerons so discreet and obedient to command as they appeared to be, and were therefore in perpetual anxiety about the fidelity of their guides: nor did the Symerons treat the Frenchmen with that submission and regard which they paid to the English, whose bravery and conduct they had already tried. At length, after a laborious march of more than seven leagues, they began to hear the hammers of the carpenters in the bay, it being the custom in that hot season to work in the night, and to rest in the day; and, in a short time, they perceived the approach of the recoes, or droves of mules, from Panama. They now no longer doubted that their labour would be rewarded, and every man imagined himself secure from poverty for the remaining part of his life; they, therefore, when the mules came up, rushed out, and seized them with an alacrity proportioned to their expectations. The three droves consisted of one hundred and nine mules, each of which carried 300 pounds weight of silver. It was to little purpose that the soldiers, ordered to convoy the treasure, attempted resistance. After a short combat, in which the French Captain and one of the Symerons were wounded, it appeared with how much greater ardour men are animated by interest than fidelity.

As it was possible for them to carry away but a small part of this treasure, after having wearied themselves with hiding it in the thickets, they determined to return

turn by the same way they came; and, without being pursued, they traversed the woods, where the French Captain, being disabled by his wound, was obliged to stay, two of his company continuing with him. When they had gone forward about two leagues, the Frenchmen missed another of their company, who, upon enquiry, was known to be intoxicated with wine, and supposed to have lost himself in the woods by neglecting to observe the guides; but common prudence not allowing them to hazard the whole company by too much solicitude for a single life, they travelled on towards Rio Francisco, at which they arrived on the 3d of April; and, looking out for their pinnaces, were surprized with the sight of seven Spanish sloops, and immediately concluded that some intelligence of their motions had been carried to Nombre de Dios, and that these vessels had been fitted out to pursue them, which might undoubtedly have overpowered the pinnaces and their feeble crews. Nor did their suspicions stop here; but immediately it occurred to them, that their men might be compelled by torture to discover where their frigate and ship were stationed, which being weakly manned, and without the presence of the chief Commander, would fall into their hands almost without resistance, and all possibility of escaping be entirely cut off. These reflections sunk the whole company into despair; and every one, instead of endeavouring to break through the difficulties that surrounded him, resigned himself up to his ill fortune; when Drake, whose intrepidity was never to be shaken, and whose reason was never to be surprized or embarrassed, represented to them, that, though the Spaniards should have made themselves masters of the pinnaces, they might yet be hindered from discovering the ships. He put them in mind, that the pinnaces could not be taken, the men examined, their examinations compared, their resolutions formed, their vessels sent out, and the ships taken in an instant. Some time must necessarily be spent before the last blow could be struck; and, if that time were not neglectfully lost, it might be possible for some of them to reach the ships before the enemy, and direct them to change their station.

They were animated with this discourse, by which they observed that their leader was not without hope; but, when they came to look more narrowly into their situation, they were unable to conceive upon what it was founded. To pass by land was impossible, as the way lay over high mountains, thick woods, and deep rivers: they had not a single boat in their power, so that passage by water seemed equally impracticable. But Drake determined upon the only means of success which their condition afforded them; and, ordering his men to make a raft out of the trees that were then floating in the river, offered himself to put out to sea upon it, and cheerfully asked who would accompany him. John Owen, John Smith, and two Frenchmen, who were willing to share his fortune, embarked with him on the raft, which was fitted out with a sail made of the biscuit sacks in which they had carried their provisions, and formed a kind of oar to direct its course instead of a rudder. Then, having comforted the rest with assurances of his regard for them, and resolution to leave nothing unattempted for their deliverance, he put off; and, after having with much difficulty sailed three leagues, descried two pinnaces hastening towards him, which, upon a nearer approach, he discovered to be his own; and, hailing them, proposed that they should anchor behind a point that jutted out into the sea, while he put to shore; and, crossing the land on foot, was received by his company with that satisfaction which is only known to those who have been acquainted with dangers and distresses.

The same night they rowed silently to Rio Francisco, where they embarked the whole company, with what treasure they had been able to bring with them through the woods; then sailing back with the utmost expedition, they returned to their frigate, and soon after to their ship, where Drake divided the gold and silver equitably between the French and English.

Here they spent fourteen days in fitting out their frigate more completely; during which time, the Frenchmen, with their ship, lay among the Cabezas, while twelve English and sixteen Symerons travelled once more into the country, as well to recover the French Captain, whom they had left wounded, as to bring away the treasure which they had hid in the woods. Drake, whom his company would not suffer to hazard his person in another land expedition, went with them to Rio Francisco, where he found one of the Frenchmen who had staid to attend their Captain, and was informed by him, upon his enquiries after his fortune, that, half an hour after their separation, the Spaniards came upon them, and easily seized upon the wounded Captain; but that his companion might have escaped with him, had he not preferred money to life; for seeing him throw down a box of jewels that retarded him, he could not forbear taking it up, and, with that and the gold which he had already, was so loaded that he could not escape. With regard to the bars of gold and silver which they had concealed in the ground, he informed them that 200 men had been employed in searching for them. The people, however, either mistrusting the informer's veracity, or confident that what they had hidden could not be found, pursued their journey; but, upon their arrival at the place, found the ground turned up for two miles round, and were able to recover no more than 13 bars of silver, and a small quantity of gold. They discovered afterwards, that the Frenchman who was left drunk in the woods, falling into the hands of the Spaniards, was tortured by them till he confessed where Drake and his company had concealed their plunder; so fatal to Drake's expedition was the drunkenness of his followers.

Then, dismissing the French, they passed by Cartagena with their colours flying, and soon after took a frigate laden with provisions and honey, which they valued as a great restorative, and then sailed away to the Cabezas. Here they staid about a week to careen their vessels, and fit them for a long voyage, determining to set sail for England; and that the faithful Symerons might not go away unrewarded, broke up their pinnaces, and gave them the iron, the most valuable present in the world to a nation whose only employments were war and hunting, and amongst whom show and luxury had no place. Pedro, their Captain, being desired by Drake to go through the ships, and to chuse what he most desired, fixed his eye upon a scymetar set with jewels, which the French Captain had presented to Drake for the provisions with which he had supplied him, and, being unwilling to ask for so valuable a present, offered for it four large quoits, or thick plates of gold, which he had formerly concealed in the waters; but Drake, desirous to shew him, that fidelity seldom is without a recompence, gave it him with the highest professions of satisfaction and esteem. Pedro, receiving it with the utmost gratitude, informed him, that by bestowing it he had conferred greatness and honour upon him; for, by presenting it to his King, he doubted not of obtaining the highest rank among the Symerons. He then persisted in his resolution of giving him the gold, which was generously thrown by Drake into the common stock; for he said that those at whose expences he had been sent out, ought to share in all the gain of the expedition, whatever pretence cavil and chicanery might supply for the appropriation of any part of it. Thus was Drake's character consistent with itself; he was equally superior to avarice and fear; and, through whatever danger he might go in quest of gold, he thought it not valuable enough to be obtained by artifice or dishonesty.

They now forsook the coast of America, which for many months they had kept in perpetual alarms, having taken more than 100 vessels of all sizes between Cartagena and Nombre de Dios, of which they never destroyed any, unless they were fitted out against them, nor ever detained the prisoners longer than was necessary for their own security or concealment, providing for them in the same manner as for themselves, and protecting

recting them from the malice of the Symérons; a behaviour which humanity dictates, and which, perhaps, even policy cannot disapprove. He must, certainly, meet with obstinate opposition who makes it equally dangerous to yield as to resist, and who leaves his enemies no hopes but from victory.

What riches they acquired is not particularly related; but, it is not to be doubted, that the plunder of so many vessels, together with the silver seized at Nombre de Dios, must amount to a very great sum, though the share that was allotted to Drake was not sufficient to lull him into effeminacy, or to repress his natural inclination to adventures. They arrived at Plymouth on the 9th of August, 1573, on Sunday in the afternoon; and so much were the people delighted with the news of their arrival, that they left the preacher, and ran in crowds to the key with shouts and congratulations.

Drake having, in the voyage just mentioned, had a view of the South Sea, as has already been related, and formed a resolution to sail upon it, did not suffer himself to be diverted from his design by the prospect of any difficulties that might obstruct the attempt, nor any danger that might attend the execution. His reputation was sufficiently established to remove all obstacles (for obstacles he met with), and to obviate the motives that produced them; but it was not till the year 1577, that he was able to assemble a force proportioned to his design, and to obtain a commission from the Queen, by which he was constituted Captain-General of a squadron, consisting of five vessels, of which the Pelican, of 100 tons, was commanded by himself as Admiral; the Elizabeth, of 80 tons, Vice-Admiral, commanded by John Winter; the Marygold, of 30 tons, by John Thomas; the Swan, of 50 tons, by John Chester; and the Christopher, of 15 tons, by Thomas Moon, the honest carpenter, who, on the former voyage, destroyed the Swan by Drake's direction.

These ships, equipped partly by himself, and partly by other private adventurers, he manned with 164 stout sailors, and furnished with such provisions as he thought necessary for so long and hazardous a voyage: nor did he confine his concern to the ordinary equipment of his ships with naval stores and military preparations, but carried with him whatever he thought might contribute to raise, in those nations with which he should have intercourse, the highest ideas of the arts and grandeur of his native country. He, therefore, not only procured a complete service of silver-plate for his own table, and furnished the cook-room with many vessels of the same metal, but engaged several musicians to accompany him; rightly judging, that nothing would more excite the admiration of savages, or uncivilized people, than the powers of music. On this occasion, however, it must not be concealed, that he engaged his men on the false pretence of sailing to Alexandria; and that it was not till after he arrived on the coast of Brazil, that he acquainted them with his design of passing the Straits, and entering the South Seas.

On the 15th of Nov. 1577, about three in the afternoon, he sailed from Plymouth; but a heavy storm (such as no man on board had ever seen before), taking him almost as soon as out of port, forced him into Falmouth, where he staid till the 13th of December to refit. He then took his departure, and on the 25th of the same month fell in with the coast of Barbary, and on the 27th cast anchor at the island of Mogadore, about one mile distant from the main, between which and the isle they found a very convenient harbour. Here he began to build the pinnaces, the frames of which he brought ready from Plymouth to be put together, as in his former voyage. While the carpenters were employed in this service, they were discovered by the Moors that inhabit those coasts, who sent two of their Chiefs on board Drake's ship, receiving at the same time two of his company as hostages. These men he not only treated in the most hospitable manner, but presented them with such things as they appeared most to admire; it being with him an established maxim to endeavour to secure in every country a kind reception to such Englishmen as should come after him,

by treating the inhabitants with kindness and generosity.

But this friendly intercourse was in appearance soon broken; for, on the next day, observing the Moors making signals from the land, they sent out their boat, as before, to fetch them to the ship; and one John Frye leapt ashore, intending to become an hostage, as on the former day, when immediately he was seized by the Moors; and the crew observing great numbers start from behind a rock with weapons in their hands, thought it next to madness to attempt his rescue, and, therefore, provided for their own security by returning to the ship. Frye was mounted on horseback, and immediately carried up into the country to their King, who being then in continual expectation of an invasion from Portugal, suspected that these ships were sent only to reconnoitre the coast, and discover a proper harbour for a more formidable fleet; but, being informed who they were, and whither they were bound, not only dismissed his captive, but made large offers of friendship and assistance; which Drake, however, did not stay to receive; but being disgusted at this breach of the laws of commerce, and apprehending further treachery, he quitted the coast on December 31, and on the 17th of January arrived at Cape Blanco, having in their passage taken several Spanish vessels, and found one in the harbour with no men.

Here, while Drake was employing his men in catching fish, and training them for land as well as sea service, the natives came down to the sea-side with amber-grease and other gums, to traffic for such commodities as they then stood most in need of, and with which Drake very generously supplied them.

Having rifled and discharged the Spanish ships, which they had taken, they sailed on the 22d of January towards the isles of Cape Verd, and on the 27th came to anchor before Mayo, hoping to furnish themselves with fresh water; but, having landed, they found the chief town deserted; and, marching farther up the country, saw the vallies extremely fruitful, and abounding with ripe figs, cocoas, and plantains, but could by no means prevail upon the inhabitants to converse or traffic with them. However, they were suffered by them to range the country without molestation, but found no water, except at such a distance from the sea, that the labour of carrying it to their ships was greater than it was at that time necessary for them to undergo. Salt, had they wanted it, might have been obtained with less trouble, being left by the sea upon the sands, and hardened by the sun, during the ebb, in such quantities, that the chief traffic of this island is carried on by means of it. Thus, though the island abounded with goats, poultry, and delicious fruits of various kinds, they could procure none of any consequence, because the Portuguese, who were then in possession of it, were prohibited all commerce with strangers on very severe penalties.

On the 31st of January they made St. Iago, an island at that time divided between the natives and the Portuguese, who, first entering these islands under the shew of traffic, by degrees established themselves, claimed a superiority over the natives, and harassed them with such cruelty, that they obliged them either to fly to the woods and mountains, where many of them perished with hunger, or to take arms against their oppressors, and, under the insuperable disadvantages with which they contended, to die almost without a battle. Such treatment had the natives of St. Iago received, which had driven them into the rocky parts of the island, from whence they made incursions into the plantations of the Portuguese, sometimes with loss, but generally with that success which desperation produces; so that the Portuguese were in continual alarms, and lived with the natural consequences of guilt, terror, and anxiety. They were wealthy but not happy, and possessed the island, but did not enjoy it.

In passing this island, the garrison of the fort discharged three pieces of cannon at them, but without effect. For this insult they took a Portuguese ship laden with wines, the pilot of which they retained, but

set the rest of the crew on shore. This man, Nuno da Silva by name, was very useful to them in traversing the coast of Brazil, being acquainted with the bays and harbours where fresh water and provisions were to be obtained. Him they continued to detain captive, though they broke up his ship before they entered the Straits, till they were about to leave the coasts of Peru, when finding him no longer serviceable, they set him on shore in the Spanish settlements, from whence he afterwards returned home, and wrote an account of the voyage as far as he went, which is thought by many to be very authentic.

It was soon after the capture of this ship that a difference arose between Drake and his friend, Mr. Thomas Doughty, which, gradually increasing, grew into inveteracy, and terminated at last in the death of the latter. Doughty was a gentleman and a scholar, whom Drake had persuaded to embark in this expedition to better his fortune; and to whom, till the incident happened which we are about to relate, he had shewn particular marks of favour and friendship; but trivial beginnings are often productive of the most important events.

The ground of the malevolence with which Drake pursued Doughty under the colour of justice, has hitherto lain concealed from the public eye; but we shall now trace it, step by step, till the fatal period when the unhappy victim was brought to the block, and when Drake, by suffering revenge to triumph over virtue, left an indelible blot upon his character, which no panegyric can wipe away.

Among the Harleian manuscripts there is a written account of this voyage, in which the author has particularly had his eye on this transaction. As he was an eye-witness of all that passed, his relation will best appear in his own words: "Captain Drake, says he, having boarded the ship of Nuno da Silva, and feasted his eyes with the view of the commodities, he committed the custody and well-ordering of this prize unto Master Thomas Doughty, as his good and esteemed friend, praying him in any case to see good order kept, and who should be the breaker thereof, to give him to understand of any such without exception of any.

"It thus chanced that General Drake had a brother (not the wisest man in christendom), whom he put into this said prize, as also divers others. This Thomas Drake, as one more greedy of prey than covetous of honesty or credit, offered himself the first and only man to break the General his brother's commandment; for he, contrary to his strict prohibition, did not only break open a chest, but did dive suddenly into the same, that Master Doughty knew not how to discharge himself against the General but by revealing it unto him; yet first Master Doughty called Thomas Drake unto him, and shewed him his great folly in this behalf, who, yielding unto his fault, prayed Master Doughty to be good unto him, and keep it from the General; but he briefly told him he could not keep it, but he would deliver it with what favour he might. So at the General's next coming on board the prize, Master Doughty opened the same unto him, who presently falling into a rage, not without some great oaths, seemed to wonder what Thomas Doughty should mean to touch his brother; and did, as it were, assure himself that he had some farther meaning in this, and that he meant to strike at his credit, and he would not, or could not, by God's life (as he phrased it), suffer it. From this time forth grudges did seem to grow between them from day to day, to the no small admiration of the rest of the company, although some envying his former favour and friendship with the General, and some, I think, doubting that his capacity would reach too far to the aggrandizing his credit in the country, talked variously of the matter; however, Master Doughty was put again into the Pelican. Thus grudges, although they had not long rested, yet were they grown to great extremities, such and so great as a man of any judgment would verily think that his love towards him in England was more in brave words than hearty good will or friendly love." So writes our author.

In proceeding on their voyage, they came within

sight of Fogo, an island so called from a mountain about the middle of it continually burning, and like the rest inhabited by the Portuguese. Two leagues to the south of Fogo lies Brava, which has received its name from its fertility, abounding with all kinds of fruits, and watered with great numbers of springs and brooks, but, having neither harbour nor anchorage, was at that time uninhabited.

Drake, having sent out his boats with plumes to sound, was not able to find any ground about it; and it is reported, that many experiments of the like kind have been made without success. However, he took in water sufficient; and on the 2d of Feb. set sail for the coast of Brazil.

On February the 17th, he passed the equator, after being becalmed near three weeks, during which time they had dreadful storms of thunder with lightning, but without any memorable accident, till, continuing their voyage, on March 28, one of their vessels with 28 men, and the greatest part of the fresh water on board, was, to their great discouragement, separated from them; but their perplexity lasted not long, for on the next day they discovered her, and she again joined her associates. In their long course, which gave them opportunities of observing several animals, both in the air and water, at that time very little known, nothing entertained or surprized them more than the flying-fish, which is nearly of the same size with a herring, and has fins of the length of his whole body, by the help of which, when he is pursued by the benito (a large kind of mackerel), as soon as he finds himself upon the point of being taken, he springs up into the air, and flies forward as long as his wings continue wet, moisture being, as it seems, necessary to make them pliant and moveable; and, when they become dry and stiff, he falls down into the water, unless some vessel intercepts him, and dips them again for a second flight. This unhappy animal is not only pursued by fishes in his natural element, but attacked in the air, where he hopes for security, by the don or spar kite, a great bird that preys upon fish; and their species must certainly be destroyed, were not their increase so great, that the young fry, in one part of the year, covers that part of the sea.

There is another fish, named the cuttle, of which whole shoals will sometimes rise at once out of the water, and of which a great multitude fell into their ship.

At length, having sailed without sight of land for 54 days, they arrived April the 5th on the coast of Brazil. "In the mean while, you shall hear, says our author, what befel: Master Drake, never leaving to seek and force upon Master Doughty, found, in the end, this opportunity to degrade him. Whether of purpose, or his own voluntary, it chanced John Brown the trumpeter to go aboard the Pelican, where, for that he had been long absent, the company offered him a hobby, among the which, Master Doughty putting in his hand, said, Fellow John, you shall have in my hand, although it be but light amongst the rest; and so laying his hand on his buttock, which perceived of John Trumpet, he began to swear wounds and blood to the company to let him loose, for they are not all (said he) the General's friends that be here; and with that turned him to Master Doughty, and said unto him (as himself presently after told me in the prize) God's wounds, Doughty, what dost thou mean to use this familiarity with me, considering thou art not the General's friend; who answered him, What, fellow John! what moves you to this, and to use these words to me, that am as good and as sure a friend to my good General as any in this place, and I defy him that shall say the contrary. But is the matter thus? why yet, fellow John, I pray thee let me live until I come into England. Thus, John Brown coming again presently aboard the prize, had not talked any long time with the General, but the boat went aboard and rested not, but presently brought Master Doughty to the prize's side, General Drake sitting in the midst of his men, who hearing the boat at the ship's side stood up, and Master Doughty offering to take hold of the ship to have entered, said the General, Star

Stay there Thomas Doughty, for I must send you to another place, and with that commanded the mariners to row him on board the fly-boat, saying unto him, it was a place more fit for him than that from whence he came: but Master Doughty, although he craved to speak with the General, could not be permitted, neither would he hear him." Soon after this, the fly-boat here mentioned, (called the Swan), was separated from them by a violent storm, "in all whose absence, says our author, the General never ceased to inveigh against Master Doughty, terming him a conjurer and a witch; and, at any time when we had foul weather, he would say that Tom Doughty was the occasion thereof, and that it came out of Tom Doughty's capcase, and would avouch the same with oaths."

After the storm above-mentioned, they steered near the land to the southward; and on the 14th anchored under a cape, which they afterwards called Cape Joy, because in two days the vessel that was missing returned to them. Here they refreshed their weary crews, and took in fresh water; but, finding the country, though pleasant without inhabitants, they weighed anchor, and, by running a little farther to the southward, found a small harbour between a rock and the main, where the rock breaking the force of the sea, the ships rode at anchor with the greatest security. On this rock they killed several seals, keeping them for food, and found them wholesome, though not palatable.

Their next course was directed to the great river of Plate, in 36 deg. of south latitude; but, not finding anchorage in that river, they failed in quest of a more convenient harbour, when they were surprized by a sudden storm, in which they again lost sight of the fly-boat. This accident determined Drake to contract the number of his ships, that he might not only avoid the inconvenience of such frequent separations, but ease the labour of his men, by having more hands in each vessel. For this purpose he sailed along the coast; and on May the 13th discovered a bay, which, though it promised fair, he durst not enter before it was examined: he, therefore, ordered his boat to be hoisted out, and, taking the line into his own hand, went on sounding the passage till he was three leagues from his ship, when on a sudden the weather changed, the skies blackened, the wind rose, and all the usual forerunners of a storm began to threaten them. Nothing was now thought of but the means of returning to the ship; but the thickness of the fog intercepting it from their sight, made the attempt almost impracticable. In this perplexity, which Drake was not more sensible of than those whom he had left in the ships, nothing was to be omitted, however dangerous, that might tend to extricate them from it. Captain Thomas, therefore, having the lightest vessel, steered boldly into the bay, and, taking the Admiral on board, dropt anchor, and lay out of danger; while the rest that were in the open sea suffered much from the tempest, and the Mary (the Portuguese prize) was driven before the wind. The others, as soon as the tempest was over, discovering by the fires that were made on shore where Drake was, repaired to him.

Here they met with no inhabitants, though there were several wigwams or huts standing, in which they found some dried fowls, and among them ostriches, of which the thighs were as large as those of a sheep. These birds are too unweildy to rise from the ground; but with the help of their wings, or rather stumps, they run so swiftly, that the English could never come near enough to shoot any of them.

Not finding this harbour convenient, or well stored with wood and water, they left it on the 15th of May, and on the 18th entered another much safer and more commodious, which they no sooner arrived at, than Drake sent Winter to the southward in search of those ships that were absent, and immediately after sailed himself to the northward, and happily meeting with the Swan, conducted her to the rest of the fleet; after which, in pursuance of his former resolution, he ordered her to be broken up, preserving the iron work for a future supply. The other vessel which was separated in the

late storm, could not be discovered. While they were thus employed upon an island about a mile from the main land, to which, at low water there was a passage on foot, they were discovered by the natives, who appeared upon a hill at a distance, dancing, and holding up their hands, as beckoning to the English to come to them, which Drake observing, sent out a boat with knives, bells, and bugles, and such things as by their usefulness or novelty he imagined would be agreeable. As soon as the English landed, they observed two men running towards them as deputed by the company, who came within a little distance, and then standing still, could not be prevailed upon to come nearer. The English, therefore, tied their presents to a pole, which they fixed in the ground, and then retiring, saw the Indians advance, who taking what they found upon the pole, left in return such feathers as they wore upon their heads, with a small bone about six inches in length, carved round the top and burnished. Drake observing their inclination to friendship and traffic, advanced with some of his company towards the hill, upon sight of whom the Indians ranged themselves in a line from east to west, and one of them running from one end of the rank to the other, backwards and forwards, bowed himself towards the rising and setting of the sun, holding his hands over his head, and, frequently stopping in the middle of the rank, leaped up towards the moon, which then shone directly over their heads; thus calling the sun and moon, the deities they worship, to witness to the sincerity of their professions of peace and friendship. While this ceremony was performing, Drake and his company ascended the hill, to the apparent terror of the Indians, whose apprehensions when the English perceived, they peaceably retired, which gave the natives so much encouragement, that they came forward immediately, and exchanged their arrows, feathers, and bones, for such trifles as were offered them. Thus they traded for some time; but by frequent intercourse, finding that no violence was intended, they became familiar, and mingled with the English without the least distrust. They go quite naked, except the skin of some animals, which they throw over their shoulders when they walk or lie in the open air. They roll up their hair, which is very long, with a plume of ostrich's feathers, and usually stick their arrows in it, that they may not encumber them, they being made with reeds headed with flint, and therefore not heavy. Their bows are about an ell long. Their chief ornament is paint, which they use of several kinds, delineating generally upon their bodies the figures of the sun and moon in honour of their deities.

It is observable, that the inhabitants of most nations amongst whom the use of cloaths is unknown, paint their bodies. Such was the practice of the inhabitants of our own country. To this custom did our earliest enemies, the Picts, owe their denomination. As it is not probable that caprice or fancy should be uniform, there must be doubtless some reason for a practice so general, and prevailing in distant parts of the world which have no communication with each other. The original end of painting their bodies was probably to exclude the cold; an end, which, if we believe some relations, is so effectually produced by it, that the men thus painted never shiver at the most piercing blasts: but, doubtless, any people so hardened by continual severities, would, even without paint, be less sensible of the cold than the civilized inhabitants of the same climate. However, this practice may contribute in some degree to defend them from the injuries of winter, and, in those climates where little evaporates by the pores, may be used with no great inconvenience: but in hot countries, where perspiration in a greater degree is necessary, the natives only use unction to preserve them from the other extreme of weather, or more probably, from the inconvenience of the flies, which, were it not for that or some such defence, would be intolerable.

These savages had no canoes, like the other Indians, nor any method of crossing the water; which was probably the reason why the birds in the adjacent islands

were so tame that they might be taken with the hand, having never been before frightened or molested. The birds here spoken of are, without doubt, the penguins of which so ample a description is given in the Voyages of Byron and Wallis. The great plenty of these fowls, and of the seals that were found every-where on the shores of this coast, contributed much to the refreshment of the English, who named the bay where they then lay, Seal-bay, from the number they there killed of those animals.

These seals seem to be the chief food of the natives; for the English often found raw pieces of their flesh half eaten, and left, as they supposed, after a full meal, by the savages, whom they never knew to make use of fire, or any art in dressing or preparing their victuals. Nor were their other customs less wild or uncouth than their way of feeding. One of them, having received a cap off the General's head, and being extremely pleased as well with the honour as the gift, to express his gratitude, retired to a little distance, and thrusting an arrow into his leg, let the blood run upon the ground, testifying, as it is probable, that he was ready to shed his blood in his defence.

When the Swan fly-boat was separated from the fleet in the storm off the coast of Brazil, the crew, despairing of ever being able to rejoin it, began to be in fear for provisions. They were on a desert coast, had no place of rendezvous, and were ignorant even of their place of destination. In this untoward situation a dispute arose among the officers, of which the author of the manuscript before cited, gives the following relation:—He had already taken notice that Master Thomas Doughty had been sent on board this vessel as a kind of punishment, and in truth so it proved; for the master of the vessel, who seems also to have been the purser, knowing upon what terms he stood with Drake, took every occasion to insult, or, as our author's phrase is, to discredit him; for those were always ranked among Drake's friends who were enemies to Master Doughty. "This man, foreseeing that provisions might run short, put himself from the mess of Master Doughty, Captain Chester, and the rest of the gentlemen, and did set himself amongst the sailors, nothing at all sparing, but rather augmenting his own diet; but how scantily those gentlemen did fare, there be some come home, that, except they will deny their own words, can make relation thereof.

"Master Doughty, with Master Chester, whom the General had made Captain of the fly-boat, found themselves so ill used, that Master Doughty accosted his friend one day in these words: I marvel, Master Chester, that you will take it at his hands to be thus used, considering that you were here authorized by the General to be our Commander. And, at the same time, he spoke to the Master, and told him, that he used so much partiality in the distribution of his provisions, that the same could not be borne, considering the extremity they were like to fall into for want of victuals; and that it was against reason that he and his messmates should be so plentifully fed, while others were at the point to starve. The Master hereat putting himself in a rage, swore that such rascals as he was, should be glad to eat the shoals (hulks) when he would have them. Master Doughty answered him again, that reason would will that he should be used as well as other men, considering his advantages. Thou any advantage here! replied the Master, I would not give a point for thee nor thy advantages; and if ever thou comest home to enjoy any advantages, I will be trussed up. Then in multiplying words, and as I heard a blow or two passing between them, the Master, in the spleen of his heart, looking at him with an evil eye, 'Thou! wilt thou have victuals! thou shalt be glad, if we do not meet with the General, the rather to eat that falls from my tail on the anchor-fluke ere thou gettest home again. Then Master Doughty, turning to Master Chester, said unto him, Master Chester, let us not be thus used at this knave's hands. Lose nothing of that authority that the General committed unto you. If you will, we will put the sword into your hands again, and you shall have the government. This case I will

aver to be true, for there were two or three witnesses sworn to these articles, as some of the special matter that he had to lose his head for."

It was not many days after this quarrel before the Swan fell in again with the fleet; when Drake, as has been said, caused her to be hauled on shore, set on fire, and burnt; or, as others say, broke up and converted into fire-wood for the use of the fleet.

Mr. Doughty, being here delivered from the fly-boat, was again restored to the Pelican, where the master with whom he had the dispute appears to have preferred a complaint against him, and with such aggravations as he thought proper to add; all which were favourably heard, and credit given to the whole relation by the General, who wanted only a pretence to persevere in his severity to the man who, being once his favourite, was now become the object of his most inveterate hatred. Doughty, provoked, no doubt, by the misrepresentations of the master, and the partiality with which they were heard, gave the General some opprobrious language, adding, "that the lightest word that came out of his (Doughty's) mouth was to be believed as soon as the General's oath. Whereupon the General did not only strike him, but commanded him to be bound to the mast; for the accomplishment of which, the master of the fly-boat took no little pains. This happened as the two ships (the Pelican and the Canter) lay together; and as soon as Doughty was released, he was put into the Canter, although greatly against his will, for that he said he knew them to be there that sought his life, as namely the master of the fly-boat, and some other desperate and dishonest people; but would he or no, thither he must, or else the General swore he would lift him out with the tackle, and for that purpose commanded the tackle to be loosed. Thus aboard the Canter he went, and his brother John Doughty with him." The Canter was a vessel taken from the Spaniards on the coast of Africa.

While they lay in this harbour, there is one remarkable incident related by this author that deserves particular notice, as it tends to illustrate the previous steps that were pursued to accomplish the ruin of this unfortunate gentleman.

"On board the fly-boat, says he, was one Thomas Cuttle, who sometime had been Captain of the Pelican under Drake, with whom the General had been tampering. This man came out from him in great wrath, and offering to go over to the main, between the which, and the island where they then lay, was (as has been said) but a shallow water. He, standing well nigh up to the middle in the water with his piece, uttered these words, Well, my Masters, quoth he, I find I am heavily borne with here, because I will not accuse this gentleman (meaning Doughty) of that, as I take God to witness, I know not by him; and, therefore, I declare before you all, that, whatsoever becomes of me, I never knew any thing by him but to be the General's friend; and, rather than I will bide this hard countenance at the General's hands, I will yield myself into cannibals' hands; and so I pray you all to pray for me."

After this public declaration the man departed; and, having reached the opposite shore, he went up into the country, where firing his piece to bring the natives to him, Drake taking it for a signal that he wanted to return, sent a boat over to the main, and brought him back.

Just before their departure from this harbour, which lay in a bay a little to the southward of Cape Hope, "Captain Drake himself came on board the Elizabeth, and calling all the company together, told them, that he was to send thither a couple of men, the which he did not know how to carry along with him this voyage, and go through therewithal, as namely, quoth he, Thomas Doughty, who is a commotioner and a seditious fellow, and a very bad and lewd fellow, and one that I have made that reckoning of as of my left hand; and his brother the young Doughty, a witch, a poisoner, and such a one as the world cannot judge of, having his knowledge from the devil; and so warning the company;

pany that none should speak to them, nor use any conference with them; if they did, he would hold them as his enemies, and enemies to the voyage. And he willed that great care should be taken that they should neither write nor read; and that he declared what wealth the worst boy in the fleet should get by this voyage, and how the worst boy should never need to go again to sea, but should be able to live in England with a right good gentleman; for, quoth he, you shall see that we will have gold come as plentiful as wood into the ships. Having finished his speech, he departed, and shortly after sent the said Thomas Doughty and his brother aboard the Elizabeth, commanding them, as they would answer it with their lives, not to set pen to paper, nor yet to read but what every man might understand and see. And sure, adds our author, their entertainment there was accordingly; for men durst not speak to them, although willingly perhaps they would; and as their fare was with the simplest in the ship, so was their lodging. But he, Thomas Doughty, having agreed with the boatswain of the ship for a cabin which stood, God knows, in an uncomfortable room, yet must he pay 3*l*. for the same in England. But what came of this to the poor fellow! he was fain for his friendly using him to lose his office, and continue in heavy displeasure."

Having staid fifteen days in the harbour, during which time they continued their friendly intercourse with the savages, on June the 3*d* they set sail towards the South Sea, and six days afterwards stopt at a little bay to break up the Christopher, which from the smallness of its size was found incapable of living in those boisterous seas, of which, before they entered them, they had conceived no adequate idea. Then passing on, they found it necessary to cast anchor in another bay, with a view to recover the Portuguese prize, which was separated from them in the storm of the 27*th* of April, and had not yet rejoined them. To return in search of it was sufficiently mortifying; to proceed without it, was not only to deprive themselves of a considerable part of their force, but to expose their friends and companions, who had voluntarily embarked on board her, to certain death or certain captivity. This consideration prevailed; and, therefore, on the 18*th*, after prayers to God, with which Drake (for example's sake) never forgot to begin an enterprise, he put to sea, and the next day near Port Julian discovered their associates, whose ship was now grown leaky, having suffered much in the first storm by which they were separated, and afterwards in the fruitless attempts to regain the fleet. Drake, therefore, being desirous to relieve their fatigues, entered Port Julian. They no sooner landed than they were accosted by two of the natives, of whom Magellan left a very terrible account, having described them as a nation of giants and monsters: nor did they find his narrative entirely without foundation; for the least of those they saw was larger and taller than the largest of their company. The two who accosted the English appeared much pleased with their new guests, received willingly whatever was given them, and very exactly observed every thing that passed, seeming more particularly delighted with seeing Oliver, the master-gunner, shoot an English arrow. They shot themselves likewise in emulation, but their arrows always fell to the ground far short of his.

Soon after this friendly contest came another, who, observing the familiarity of his countrymen with the strangers, appeared much displeased; and, as the Englishmen perceived, endeavoured to persuade them from such an intercourse. What effect his arguments had was soon after apparent; for another of Drake's companions, being desirous to shew the third Indian a specimen of the English valour and dexterity, attempted likewise to shoot an arrow; but drawing it with his full force, burst the bow-string: upon which, the Indians, who were unacquainted with their other weapons, imagining them disarmed, followed the company as they were walking negligently down towards their boat, and let fly their arrows, aiming particularly at Winter, who

had the bow in his hand. He, finding himself wounded in the shoulder, endeavoured to refit his bow; and, turning about, was pierced with a second arrow in the breast. Oliver, the gunner, immediately presented his piece at the insidious assailants, which failing to take fire, gave them time to level another flight of arrows, by which he was killed; nor, perhaps, had any of them escaped, surprized and perplexed as they were, had not Drake animated their courage, and directed their motions, ordering them, by perpetually changing their places, to elude as much as might be the aim of their enemies, and to defend their bodies with their targets; and instructing them by his own example to pick up and break the arrows as they fell, which they did with so much diligence that the Indians were soon in danger of being disarmed. Then Drake himself taking the gun, which Oliver had so unsuccessfully attempted to make use of, discharged it at the Indian that first began the fray and had killed the gunner, aiming it so happily that the hail-shot, with which it was loaded, tore open his belly, and forced him to such terrible outcries, that the Indians, though their numbers increased, and many of them shewed themselves from different parts of an adjoining wood, were too much terrified to renew the assault; and suffered Drake without molestation to withdraw his wounded friend, who, being hurt in his lungs, languished two days, and then dying, was interred with his companion with the usual ceremony of a military funeral.

They staid here two months after this quarrel, without receiving any other injuries from the natives, in which time they discovered the gibbet on which Magellan had formerly executed some of his mutinous company, and where "Drake, according to the writers of the *Biographia Britannica*, did the least commendable action of his life, in executing Mr. John Doughty, a man next in authority to himself; in which, however, he preserved a great appearance of justice."

To clear this matter fully, it will be necessary to bring together the substance of what these authors have said on the subject, and then to add the plain relation from the manuscript already quoted.

'Here it was (at Port St. Julian), say these writers, that on a sudden, having carried the principal persons engaged in the service to a desert island lying in the bay, he called a kind of council of war, or rather court martial, where he exposed his commission, by which the Queen granted him the power of life and death, which was delivered him with this remarkable expression from her own mouth; "We do account, that he, Drake, who strikes at thee, does strike at us." He then laid open, with great eloquence, (for, though his education was but indifferent, he had a wonderful power of speech) the cause of this assembly. He proceeded next to charge Mr. John Doughty, "who had been second in command, during the whole voyage," when Drake was present, and first in his absence, with plotting the destruction of the undertaking, and the murder of his person. He said he had the first notice of this gentleman's bad intentions before he left England; but that he was in hopes his behaviour towards him, would have extinguished such disposition, if there had been any truth in the information. He then appealed for his behaviour to the whole assembly, and to the gentleman accused. He next exposed his practices from the time that he left England, while he lived towards him with all the kindness and cordiality of a brother; which charge he supported by producing papers under his own hand, to which Mr. Doughty added a full and free confession. After this, the Captain, or, as in the language of those times he is called, the General, quitted the place, telling the assembly he expected that they should pass a verdict upon him, for he would be no judge in his own cause. Camden, as the reader will see, says, that he tried him by a jury; but, other accounts affirm, that the whole forty persons of which the court was composed, had judged him to death, and gave this in writing under their hands and seals, leaving the time and manner of it to the General. Mr. Doughty himself

himself said, that he desired rather to die by the hands of justice than to be his own executioner. Upon this, Captain Drake having maturely weighed the whole matter, presented three points to Mr. Doughty's choice: first, to be executed upon the island where they were; next, to be set on shore on the main land; or, lastly, to be sent home to abide the justice of his country. He desired he might have till the next day to consider of these, which was allowed him, and then, giving his reasons for rejecting the two last, he declared that he made the first his choice; and, having received the sacrament with the General, from the hands of Mr. Francis Fletcher, Chaplain to the fleet, and made a full confession, his head was cut off with an axe by the Provost-Marshal, July the 2d, 1578.

As to the imputation which this matter brought upon Drake, we will first cite what Camden says of this transaction: "On the 26th of April, entering into the mouth of the river of Plate, he saw an infinite number of sea-calves; from thence sailing into the haven of St. Julian he found a gibbet, set up, as it was thought, by Magellan for the punishment of certain mutineers. In this very place John Doughty, an industrious and stout man, and the next unto Drake, was called to his trial for raising a mutiny in the fleet, found guilty by twelve men after the English manner, and condemned to death, which he suffered undauntedly, being beheaded, having first received the holy communion with Drake. And, indeed, the most impartial persons in the fleet were of opinion, that he had acted seditiously, and that Drake cut him off as an emulator of his glory, and one that regarded not so much who he himself excelled in commendation for sea matters, as who he thought might equal him; yet wanted there not some who, pretending to understand things better than others, gave out that Drake had in charge from Leicester to take off Doughty upon any pretence whatever, because he had reported that the Earl of Essex was made away by the cunning practices of that Earl."

We find this matter, add the writers just cited, touched in several other books, and particularly in two, which were written on purpose to expose the Earl of Leicester, and, perhaps, deserving the less credit for that reason.

It may be offered in defence of Sir Francis Drake, that this man was openly put to death, after as fair a trial as the circumstances of time and place would permit; that he submitted patiently to his sentence, and received the sacrament with Drake, whom he embraced immediately before his execution. Besides these, there are two points that deserve particular consideration: first, that, in such expeditions, strict discipline, and legal severity, are often absolutely necessary; secondly, that, as to the Earl of Essex, for whose death Doughty had expressed concern, he was Drake's first patron, and it is, therefore, very improbable he should destroy a man for endeavouring to detect his murderer. We may add to all this, if liberty may be indulged to conjectures, that this man, presuming upon the Earl of Leicester's favour (who very probably imposed him upon Drake to be rid of him), was from thence encouraged to form designs against Drake; and this might also be the reason which hindered him from inclining to an absolute pardon, as doubting whether it was possible to trust one who had so far abused his confidence already, and whose known interest with so great a man might always enable him to find instruments, in case he was wicked enough to enter upon fresh intrigues.

We shall just remark upon what is above quoted, that the authors do not seem to have been well informed; for they have all along imputed to John Doughty what related to his brother Thomas; and, if credit may be given to the author of the manuscript (John Cook by name), this unfortunate Thomas fell a sacrifice to Drake's resentment. "On this island in Port St. Julian, says he, passed many matters, which, I think, God would not have to be concealed, especially for that they tended to murder; for he (Drake) spewed out against Thomas Doughty his venom. Here he ended all his

conceived hatred, not by courtesy and friendly reconciliation, but by most tyrannical blood-spilling; for he was never quiet while he lived, who in wisdom and honesty government as far surpassed him, as he in tyranny surpassed all men. The world never committed a fact like unto this; for here he murdered him that, if he had well looked unto himself, had been a more sure and steadfast friend unto him than ever was Pythias to his friend Damon, as I think the sequel of this case will shew.

The last day of June, the General himself, being set in a place of judgment, and having the whole company brought on shore, and having Captain John Thomas set close by him, who opened a bundle of papers that were rolled up together, wherein was written divers and sundry articles, the which, before they were read, the General spoke unto the purport of them, and turning himself to Thomas Doughty, who was there present, being before brought thither more like a thief than a gentleman of honest conversation, he began his charge thus: Thomas Doughty, you have here fought by divers means, in as much as you may, to discredit me, to the great hinderance and overthrow of this voyage; besides other great matters with which I have to charge you, the which, if you can clear yourself of, you and I shall be very good friends; whereof if you cannot, you have deserved death. Master Doughty answered, It should never be approved that he had merited ill by undertaking any villainy towards him. By whom, quoth the General, will you be tried? Why, good General, said he, let me live to come unto my country, and I will there be tried by her Majesty's laws. Nay, Thomas Doughty, said he, I will here impanel a jury on you to enquire into those matters that I have to charge you withal. Why, General, replied Doughty, I hope you will see your Commission be good. I'll warrant you, answered the General, my Commission is good enough. I pray you then let us see it, said Master Doughty; it is necessary that it should be here shewn. Well, quoth he, you shall not see it. Then, addressing himself to the company, You see, my Masters, how this fellow is full of prating, bind me his arms, for I will be safe of my life. My Masters, you that be my good friends, Thomas Good, Gregory —, you there, my friends, bind him; so they took and bound his arms behind him. Then he uttered divers furious words unto Thomas Doughty, as charging him to be the man that poisoned my Lord of Essex; whereas Master Doughty avouched it to his face, that he was the man that brought the General first to the presence of my Lord in England. Thou bring ME, quoth the General, to my Lord! See, my Masters, see here how he goeth about to discredit me. This fellow with my Lord was never of any estimation. I think he never came about him as a gentleman; for I that was daily with my Lord never saw him there above once, and that was long after my entertainment with my Lord.

Then, in fine, was there a jury called, whereof Master John Winter was foreman. Then by John Thomas were the articles read unto them, even once over for a last farewell, for fear, that men should have carried them away by memory; all which appeared to consist of words of unkindness, and to proceed of some choler when the prisoner was provoked, all which Doughty did not greatly deny; until at length came in one Edward Bright, whose honesty of life I have nothing to do with, who said, Nay, Thomas Doughty, we have other matter for you yet, that will a little nearer touch you. It will if faith bite you to the quick. I pray thee, Ned Bright, said the prisoner, charge me with nothing but truth, and spare me not. Then John Thomas read further for his last article to conclude the whole withal, That Thomas Doughty should say to Edward Bright, in Master Drake's garden, that the Queen's Majesty and Council would be corrupted. So Bright holding up his fingers, said, How like ye this, gare, sirrah! Why, Ned Bright, said Master Doughty, what should induce thee thus to belye me? thou knowest that such familiarity was never between thee and me: but

but it may be, that I have said, if we brought home gold, we should be the better welcome; but yet this is more than I do remember. Then it came out, on farther evidence, that Master Doughty should say, that my Lord Treasurer had a plot of the present voyage. No, that he hath not, quoth General Drake. The other replied, that he had, and had it of him. See, my Masters, said Drake, what this fellow hath done. God will have his treachery all known; for her Majesty gave me special commandment, that of all men my Lord Treasurer should not know it; but you see his own mouth hath bewrayed him: so this was a special article against him to hurt his throat, and greatly he seemed to rejoice at this advantage.

"Then Master Doughty offered him, if he would permit him to live, and to answer these objections in England, he would set his hand to whatso was there written, or to any thing else that he would set down. Well, once let these men, quoth the General, first find whether you are guilty in this or no, and then we will talk further of the matter. And then he delivered (after they had all taken their oaths given by John Thomas) the bills of indictment, as I may term them, unto Mr. John Winter, who was foreman of this inquest. Then Master Leonard Vicary, a very assured friend of Master Thomas Doughty's, said unto him, General, this is not law, nor agreeable to justice, that you offer. I have not to do with you crafty lawyers, neither do I care for the law; but I know what I will do. Why, quoth Master Vicary, who was one of his jury, I know not how we may answer his life. Well, Master Vicary, quoth he, you shall not have to do with his life; let me alone with that; you are but to find whether he be guilty in these articles that here are objected against him, or no. Why, very well, said Master Vicary, then there is, I trust, no matter of death. No, no, Master Vicary, quoth he; so with this the jury went together, finding all to be true, without any doubt or stop made, but only to that article that Edward Bright had objected against him; for it was doubted of some whether Bright were sufficient with his only word to cast away the life of a man. And truly it did argue small honesty in a man to conceal such a matter if it had been spoken in England, and to utter it in this place where will was law, and reason put in exile; for, an honest subject would not have concealed such matter, which made some doubt of an honest dealing. But, to be brief, answer was made, that Bright was a very honest man; and so the verdict being given in, it was told to the General, that there was doubt made of Bright's honesty. Why, quoth Master Drake, I dare to swear that what Ned Bright has said is very true (yet within a fortnight after, the same Bright was in such disliking with him, as he seemed to doubt his life; and having displaced him of the Pelican, and put him into the Marigold, he gave for reason, that himself would be safe, and he would put him far enough from him). Thus having received in the verdict, he rose off the place, and departed towards the water-side, where, calling all the company with him, except Master Thomas Doughty and his brother, he there opened a certain bundle of letters and bills, and, looking on them, said, God's will; I have left in my cabin that I should especially have had (as if he had there forgotten his Commission): but, whether he forgot his Commission or no, he much forgot himself, to sit as Judge without shewing that he had any; but, truly, I think he shewed to the uttermost what he had: for here he shewed forth, first, letters that were written, as he said, by Master Hankins to my Lord of Essex for his entertainment; secondly, he shewed letters of thanks from my Lord of Essex unto Master Hankins, for preferring so good a servitor unto him, and how much he had pleased him; then read he letters that past from my Lord of Essex unto Secretary Walsingham in his great commendation; then shewed he letters of Master Hatton's unto himself, tending for the acceptance of his men John Thomas and John Brewer, for their well usage in this voyage; and, lastly, he read a bill of her Majesty's

No. 47.

adventure of a thousand crowns (but I most marvelled that so many noblemen and gentlemen did leave their letters in his hands, except it were to shew in this place for his credit). So when he had all done, he said, Now, my Masters, you may see whether this fellow hath sought my discredit or no, and what should hereby be meant but the very overthrow of the voyage; as, first, by taking away of my good name, and altogether discrediting me, and then my life, which I being bereaved of, what then will you do? You will fain one to drink another's blood, and so to return again unto your own country; you will never be able to find the way thither. And now, my Masters, consider what a great voyage we are like to make, the like was never made out of England; for by the same the worst in this fleet shall become a gentleman; and, if this voyage go not forward, which I cannot see how possibly it should, if this man live, what a reproach it will be, not only unto our country, but especially unto us, the very simplest here may consider of. Therefore, my Masters, they that think this man worthy to die, let them with me hold up their hands; and, they that think him not worthy to die, hold down their hands; at the which, divers that envied his former felicity, held up their hands; some others, again, for fear of his favouritry, flicked not to lift their hands, although against their hearts; but some, again, lifted up their hands and very hearts unto the Lord, to deliver us of this tyrannous and cruel tyrant; who upon the same, coming to his former judgment-seat, pronounced him the child of death, and persuaded him withal, that he would by this means make him the servant of God: and said farther, if any man could, between this and next meeting, devise any way that might save his life, he would hear it; and wished himself to devise some way for his own safeguard. Well, General, quoth he, seeing it is come to this pass, "that I see you would have me made away," I pray you carry me with you to Peru, and there set me ashore. No, truly, Master Doughty, I cannot answer it to her Majesty, if I should so do; but, how say you, Thomas Doughty, if any man will warrant me to be safe from your hands, and will undertake to keep you sure, you shall see what I will say unto you. Master Doughty then calling on Master Winter, said unto him, Master Winter, will you be so good as to undertake this for me? Then Master Winter said unto Master Drake, that he should be safe of his person, and he would warrant him, if he did commit him to his custody. Then Drake, a little pausing, said, See then, my Masters, we must thus do; we must nail him close under the hatches, and return home again without making any voyage, and if you will do so, then speak your minds. Then a company of desperate bankrupts that could not live in their own country without the spoil of that as others had got by the sweat of their brows, cried, God forbid, good General! which voice was no less attentively heard, for there needed no spur to a willing horse. Thus, telling Master Doughty to prepare for his death, and having given him one whole day's respite to set all things in order, he rose and departed, promising that his continual prayers to God should not cease, that it would please God to put it into his head how he might do him good: but he had so often before sworn that he would hang him, that I think at this present he meant to do him little good. Thus Master Doughty continuing all this night, the next day, and the second night in his prayers, except some small time that he used in setting his worldly business in some way, and distributing to such as he thought good, such things as he then had with him, was the 2d day of July commanded him to prepare himself, and to make ready to die. Then Master Doughty, with a more cheerful countenance than ever he had in all his life, to the show, as one that did altogether condemn life, prayed him, that, ere he died, he might receive the sacrament; which was not only granted, but Drake himself offered to accompany him to the Lord's Table, for the which Master Doughty gave him hearty thanks, never worse terming him than my good Captain. Master Drake offered him withal

make choice of his own death, and for that he said he was a gentleman he should but lose his head, the which kind of death was most agreeable to his mind, in as much as he must needs die. And, truly, I heard say, that Master Drake offered him, if he would, that he should be shotten to death with a piece, and that he himself would do that exploit, and so he should die by the hands of a gentleman. But, in fine, they together received the Lord's Supper; the which, I do ever assure myself, that he did take with as uncorrupted a mind as ever did any innocent of the world; for he, sure, shewed himself to have all his affiance and only trust in God; he shewed himself so valiant in this extremity as the world might wonder it; he seemed to have conquered death itself, and it was not seen, that of all this day before his death, that ever he altered one jot of his countenance, but kept it as staid and firm as if he had some message to deliver to some nobleman. They having thus received the sacrament, there was a banquet made, such as the place might yield, and there they dined together, in which time, the place of execution being made ready, after dinner, as one not willing any longer to delay the time, he told the General, that he was ready as soon as pleased him; but prayed him, that he might speak alone with him a few words, with the which they talked a-part: the space of half a quarter of an hour, and then with bills and slaves he was brought to the place of execution, where he shewed himself no less valiant than all the time before; for, first, here kneeling on his knees, he first prayed for the Queen's Majesty of England his Sovereign lady and mistress; he then prayed to God for the happy success of this voyage, and then prayed to God to turn it to the profit of his country: he remembered also therein divers his good friends, and especially Sir William Winter, praying Master John Winter to commend him to that good Knight; all which he did with so chearful a countenance, as if he had gone to some great prepared banquet, the which, I sure think, that he was fully resolved that God had provided for him; so, at the last, turning to the General, he prayed him that he might make water ere he died, for, quoth he, the flesh is frail, and withal turned him about and did so; and, coming again, said, Now, truly, I may say as said Sir Thomas More, that he that cuts off my head shall have little honesty, my neck is so short: So turning him, and looking about on the whole company, he desired them all to forgive him, and especially some that he did perceive to have displeasure borne them for his sake, whereof Thomas Cuttle was one, Hugh Smith was another, and divers others: whereupon, Smith prayed him to say before the General then, whether ever they had any conference together that might redound to his (the General's) prejudice or detriment. He declared it at his death, that neither he, nor any man else, ever practised any treachery towards the General with him; neither did he himself ever think any villainous thought against him. Then he prayed the General to be good unto the same Hugh Smith, and to forgive him for his sake. So the General said, Well, Smith, for Master Doughty's sake, and at his request, I forgive thee; but become an honest man hereafter. So then, Master Doughty embracing the General, naming him his good Captain, bid him farewell; and so bidding the whole company farewell, he laid his head to the block, the which being stricken off, Drake most despitefully made the head to be taken up and shewed to the whole company, himself saying, See, this is the end of traitors! So he being buried, and those things finished, the whole company being together, Master Drake protested before God, that whosoever he was who should offend but the eighth part that Thomas Doughty had done, should die for it. He also protested, and swore by the life of God, and the blessed sacrament which he that day had received, that whosoever he were within the fleet that did give another a blow, should lose his hand, without exception of any; and yet, the next day, it fortuned that Master Doughty's younger brother, walking both silently and mournfully, as well for remem-

brance of his brother's late death, as also weighing the imminent peril over his own head, (as what has been already said and the present consequence may purport), there comes unto him this Edward Bright, the chief instrument of his brother's death, saying unto him, God's wounds! thou villain, what knowest thou by my wife? and withal struck at him with his ruler, as of purpose to pick a quarrel, to hasten his end also. Why, Ned Bright, quoth he, thou seest in what case I am, I pray thee let me alone; and withal bore off the blow with his arm, wherewith the ruler broke: but Bright, seeming very furious, thrust him in the face with the piece that remained in his hand, the splinters whereof entered an inch into his face; presently upon the which, he went unto the General to complain of Bright. Why, John Doughty, quoth he, without having any regard of his oath the day before made, Ned Bright will be open to your revenge in England; for, I dare say, thy brother did belye her, when he said that she had an ill name in Cambridge. Then might every man perceive the little-meant honesty."

From this plain narrative of the trial and execution of Doughty, of the genuineness of which there cannot be the least doubt, as the concomitant little circumstances all concur to confirm the author both an eye and ear witness of what he has related, there is reason to believe, that the success of the voyage covered the iniquity of the undertaker; and that the immense booty which Drake brought to England, enabled him to stifle the complaints of individuals; and, by a proper address, to convert the acts of oppression, murder, and piracy, of which he was guilty, into so many deeds of necessary duty, in order to the accomplishment of the main object, the acquisition of wealth at the expence of honesty.

That Drake never had a Commission from the Queen, as his friends would suggest, appears not only from his not producing it at the trial of Doughty (which can hardly be justified, in contempt to the prisoner), but from his not producing it upon another occasion, when, as shall be shewn immediately, he vauntingly produced other credentials of far less moment, in order to justify his conduct, and give him credit with his company. The story, then, of the remarkable words foisted into the mouth of his Sovereign, and recited by his biographer, is as false as inconsistent with the character of that wise Princess, who, though there is reason from her after-conduct to conclude that she was privy to the voyage, yet never openly countenanced it, till after it was completed, and the issue of it determined; as appears from the account of the conversation which Drake himself gave to his followers, a few days before he left Port St. Julian to seek a passage into the South Seas.

"On the 6th of August, says our author, he commanded his whole company to be ashore, and, placing himself in a tent, one side of which was open, and calling Master Winter on one side of him, and John Thomas on the other side, his man laid before him a great paper book, and withal Master Fletcher offered himself to make a sermon. Nay forsooth, Master Fletcher, said he, I must preach this day myself, although I have small skill in preaching. Well, all ye the company, here are ye, or not? Answer was made, that they were all here. Then commanded he every ship's company severally to stand together; which was also done. Then, said he, My Masters, I am a very bad orator, for my bringing up hath not been in learning; but whatso I shall here speak, let every man take good notice of, and let him write it down, for I will speak nothing but what I will answer it in England, yea, and before her Majesty, as I have it here already set down [but whether it were in his book or not, that I know not, but this was the effect of it, and very near the words]: Thus it is, my Masters, that we're very far from our country and friends; we are compassed in on every side with our enemies; wherefore we are not to make small reckoning of a man, for we cannot have a man if we would give for him ten thousand pounds; wherefore we must have these mutinies and discontents that are grown amongst

amongst us redressed; for, by the life of God, it doth even take my wits from me to think on it. Here is such controversy between the sailors and the gentlemen, and such stomaching between the gentlemen and sailors, that it doth even make me mad to hear it. But, my Masters, I must have it cease; for I must have the gentlemen to haul and draw with the mariners, and the mariners with the gentlemen; and let us shew ourselves to be all of a company; and let us not give occasion to the enemy to rejoice at our decay and overthrow. I would know him that would refuse to set his hand to a rope; but I trust there is not any such here; and, as gentlemen are very necessary for government sake on the voyage, so have I shipped them for that purpose, and to some further intent; and yet, though I know sailors to be the most envious people of the world, and so unruly without government, yet may not I be without them. Also, if there be any here willing to return home, let me understand of them; and here is the *Marigold*, a ship that I can very well spare, I will furnish her to such as will return with the most credit that I can give them, either by my letters or any way else; but let them take care that they go homeward; for, if I find them in my way, I will surely sink them; therefore, you shall have time to consider hereof until tomorrow, for, by my troth, I must needs be plain with you, "I have taken that in hand that I know not in the world how to go through withal;" it passeth my capacity; it hath even bereaved me of my wits to think on it. [Well, yet the voice was, that none would return; they would all take such part as he did.] Well then, my Masters, quoth he, came ye all forth with your own good wills, or no? They answered, All, willingly. At whose hands, my Masters, take ye to receive your wages? At yours, answered the company. Then, said he, how say you, will you take wages, or stand to my courtesy? To your courtesy, good Captain, was the reply. Then he commanded the steward to the *Elizabeth* to bring him the key of the stores, the which he did; then, turning him unto Master Winter, he said, Master Winter, I do here discharge you of your Captainship; and so in brief he said to all the Officers. Then Master Winter and John Thomas asked him what should move him to displace them? He asked in return, whether they could make any reason why he should not do so? So willing them to content themselves, he willed silence in those matters, saying, Ye see here the great disorders we are entangled into; and, although some have already received condign punishment, as by death, who, I take God to witness, as you all know, was to me as my other hand, yet you see, over and besides the rest, his own mouth did bewray his treacherous dealings: and see, how, trusting to the singularity of his own wit, he over-reacht himself at unawares. But see what God would have to be done; for her Majesty commanded, that of all men my Lord Treasurer should have no knowledge of this voyage, and to see that his own mouth hath declared that he had given him a plot thereof. But, truly, my Masters, and as I am a gentleman, there shall no more die; I will lay my hand on no more, although there be here who have deserved as much as he; and so charging one Worrall that was present, that his case was worse than Doughty's, who, in Master Doughty's extremities, was one of Drake's chief confellows, who, humbling himself to Drake, even upon his knees, prayed him to be good unto him, Well, well, Worrall, said he, you and I shall talk well enough of this matter hereafter. Then he charged one John Audley with some ill dealings towards him, but opened no matter, but said, he would talk with him alone after dinner. Here is some again, my Masters, not knowing how else to discredit me, say and affirm, that I was set forth on this voyage by Master Hatton; some by Sir William Winter; and some by Master Hankins; but these are a company of idle heads that have nothing else to talk of. And, my Masters, I must tell you, I do know them as my very good friends; but, to say that they were the fitters forth of this voyage, or that it was by their means, I tell you it was nothing so.

But, indeed, thus it was, My Lord of Essex wrote in my commendation unto Secretary Walsingham more than I was worthy; but by like I had deserved somewhat at his hands, and he thought me in his letters a fit man to serve against the Spaniards for my practice and experience that I had in that trade; whereupon, indeed, Secretary Walsingham did come to consult with his Lordship, and declared unto him, that for that her Majesty had received divers injuries of the King of Spain, for the which, she desired to have some revenge; and withal, he shewed me a plot, willing me to set my hand, and to write down where I thought he might most be annoyed; but I told him some part of my mind, but refused to set my hand to any thing, affirming, that her Majesty was mortal, and that, if it should please God to take her Majesty away, it might so be that some person might reign that might be in league with the King of Spain, and then will mine own hand be a witness against myself. Then was I very shortly after, and on an evening, sent for unto her Majesty by Secretary Walsingham; and, the next day, coming to her Majesty, these, or the like words, she said, Drake, so it is that I would gladly be revenged on the King of Spain for divers injuries that I have received: and said further, that he was the only man that might do this exploit, and withal craved his advice therein, who told her Majesty of the small good that was to be done in Spain, but the only way was to annoy him by his Indies. Then, with many more words, he shewed forth a bill of her Majesty's adventure of 1000 crowns, which, however, he said at some time before, that her Majesty did give him towards his charges. He shewed also a bill of Master Hatton's adventure, and divers letters of credit that had passed in his behalf; but he never let them come out of his own hands. He said also, that her Majesty did swear by her crown, "That, if any within her realm did give the King of Spain hereof to understand (as she suspected but two), they should lose their heads therefore." And now, Masters, said he, let us consider what we have done: "We have now set together by the ears three mighty Princes, namely, her Majesty, the Kings of Spain and Portugal; and, if this voyage should not have good success, we should not only be a scorning, or a reproachful scoffing-stock unto our enemies, but also a great blot to our whole country for ever; and, what triumph would it be to Spain and Portugal; and, again, the like would never be attempted." And now, restoring every man again to his former office, he ended: thus shewing the company that he would satisfy every man, or else he would sell all that he ever had even unto his plate; for, quoth he, I have good reason to promise, and am best able to perform it; for, I have somewhat of mine own in England; and, besides that, I have as much adventure in this voyage as three of the best whatsoever; and, if it so be, that I never come home, yet will her Majesty pay every man his wages, whom indeed you and I all came to serve; and, for to say you came to serve me, I will not give you thanks; for it is only her Majesty that you serve; and this voyage is only her fitting forth: so willing all men to be friends, he willed them to depart about their business. The 8th of August, they weighed anchor and departed; but, the day before, he came on board the *Elizabeth*, and swore very vehemently, I know not upon what occasion, that he would hang to the number of 30 in the fleet that had deserved it: and then again charged Worrall that his case was worse than Doughty's, and that by God's wounds he had deserved to be hanged. And, Master Winter, said he, where is your man Ulysses? By God's life, if he were my man, I would cut off his ears: nay, by God's wounds, I would hang him; but wherefore truly I do not know."

Nothing can be a clearer proof that Drake had no Government Commission than the above account. In his speech, which the writer says is nearly in his own words, he does not so much as pretend to have received any Commission, only a private intimation from the Queen and Walsingham, that her Majesty wanted to be revenged

revenged of divers injuries received from the King of Spain. But was countenancing four or five piratical plunderers to rob innocent people, a princely way for one Sovereign to take revenge of another, in times of profound peace? It was, indeed, a pitiful connivance in Queen Elizabeth to engage 1000 crowns in a piratical adventure of this kind, and that could never have been credited of that magnanimous Princess, had she not afterwards approved of his piracy, by going aboard his ship, and openly approving what, it was even then said, least became a trading nation to encourage, the breach of treaties, and piratical practices. But, it is remarkable, that five months elapsed after his return to England before her Majesty's pleasure was publicly known; during which time men talked variously of the expedition, and the fate of Drake seemed to hang in suspense; so true proved Doughty's prediction, that "the Queen's Majesty and Council might be corrupted."

That Drake bore no naval Commission appears still more clearly, from his displacing the Captains and Officers of all his ships without demanding from them their Commissions; from his lifting his men, not for any hostile expedition, but for a trading voyage to Alexandria; and from his asking them, before his setting sail from the Port of St. Julian to enter the South Seas, from whom they expected their wages. From these circumstances it follows incontestibly, that, if he had a naval Commission, he was the only Officer in the fleet possessed of one;—Doughty, whom he beheaded, and who, before their falling out, was second in command, bore no naval Commission; and, it is more than probable, that this gentleman's questioning the Commission of Drake was the real cause of his death, as Drake more than once charges him with the overthrow of the voyage, which he could no otherwise effect than by discrediting a Commission, on the authority of which both Officers and men were to be persuaded to plunder a people at peace with their nation, and without which every man was liable to be executed for piracy, whenever he should be overpowered.

It were needless for us to enlarge our remarks; every reader has now the subject before him, and every reader will form a judgment for himself.

What we have said, in consequence of having traced this transaction from beginning to end, may seem to clash with the opinion we previously entertained of Drake's humanity, courage, and kindness to his followers, but will not seem strange to those who are acquainted with the nature of periodical writings, where one part of the work is necessarily printed off before the other is written. In pursuing the course of this voyage, new authors have been consulted, and new lights collected, which have enabled us to detect not only the errors of other writers, but also to correct our own; and, from the sequel of this voyage, we may venture to foretel, that the reader will concur in sentiment with us, that, though Drake was bold, he was not honest; that, though he did not kill those he plundered and had no motive to destroy, he spared none who opposed his designs, or who did not pay implicit obedience to his arbitrary will; that, though he was an able seaman, he was a jealous rival; and that, though he was a gallant leader, he was a most tyrannical Commander. We shall now accompany him to the South Seas, where the Spaniards, not suspecting an enemy, were in no condition to defend themselves against his attacks.

Drake having reduced the number of his ships to three, they left the port, and on August the 20th entered the Straits of Magellan, in which they struggled with contrary winds, and the various dangers which the intricacy of that winding passage exposed them to, till night, when they had passed the first narrow, and had entered a wider sea, where they discovered an island, to which they gave the name of Elizabeth, in honour of their sovereign. On the 24th they came to an island, in which they found such an infinite number of birds, since called penguins, that they killed 3000 of them in one day. This bird, of which they then knew not the name, they describe as somewhat less than a wild goose,

without feathers, and covered with a kind of down, unable to fly or rise from the ground, but capable of running and swimming with amazing celerity. They feed on fishes in the sea, and come to land only to rest in the day, and lay their eggs, which, according to later voyagers, they deposit in holes, as regularly dispersed and as numerous as the cells in a beehive.

From these islands to the South Sea the strait becomes very crooked and narrow; so that sometimes by the interposition of head-lands the passage seems entirely shut up. To double these capes they found it very difficult, on account of the frequent variations to be made in the course. Here are, indeed, as Magellan observes, many harbours; but in most of them no bottom is to be found, which, however, does not seem verified by experience; the harbours being in general good, though the tides and blasts continually rushing in from various directions create the danger. The land on both sides rises into innumerable mountains; the tops of them were encircled with clouds and vapours, which, being congealed, fall down in snow, and increase their height by hardening into ice; an observation which might naturally occur to Drake, who passed the strait in their winter before the snows were dissolved. However, even at that season, which answers to our February, they found the vallies, in some places, green, fruitful, and pleasant. Anchoring in a bay near Cape Forward, Drake, imagining the strait quite shut up, went in his boat to endeavour to find some other passage out; and, having found an inlet towards the North, was returning to his ships; but curiosity soon prevailed upon him to stop for the sake of observing a canoe or boat with several natives of the country in it. He could not at a distance help admiring the form of this little vessel, which seemed inclining to a semi-circle, the stern and prow standing up, and the body sinking inward; but much greater was his wonder, when, upon a nearer inspection, he found it made only with the barks of trees, sewed together with thongs of seal-skin, so artificially, that scarcely any water entered the seams.

The people were well-shaped, and painted like those who have been already described. On the land they had a hut built with poles, and covered with skins, in which they had water-vessels and other utensils, made likewise with the barks of trees. Among these people they had an opportunity of remarking, what is frequently observable in savage countries, how natural sagacity and unwearied industry may supply the want of such manufactures or natural productions as appear to us absolutely necessary for the support of life. Though the inhabitants were wholly strangers to iron and to the use we make of it, yet, instead of it, they substituted the shell of a muscle, of prodigious size, found upon their coasts. This they ground upon a stone to an edge, which was so firm and solid, that neither wood nor stone were able to resist it. With instruments made of shells, these simple people were able to perform all their mechanic operations; nor do they seem so deformed and ugly as our late voyagers represent them, who being, perhaps, more refined than those who sailed with Captain Drake, might fancy a greater difference between themselves and these savages than in nature there really is.

On this occasion we cannot forbear remarking, that, though Drake entered the strait in what is accounted the most unfavourable season, yet he passed it in sixteen days, though, at that time, wholly unknown; a passage the more extraordinary, as none of our later voyagers made it in less than thirty-six days in the middle of summer, and Captain Wallis was at least four months in making it.

Drake, as has been said, having taken a survey of the country from Cape Forward, continued his course to the North-west-ward, and, on the sixth of September, entered the great South Sea, on which no English vessel had ever been navigated before; and proposed to have directed his course towards the Line, that his men, who had suffered by the severity of the climate, might recover their strength in a warmer latitude. But his design

sign was scarce formed, before it was frustrated; for on September the seventh, after an eclipse of the moon, a storm arose so violent that it left them little hopes of surviving it: nor was its fury so dreadful as its continuance; for it lasted, with little intermission, thirty-two days, in which time they were driven more than 200 leagues out of their course, without being able either to avail themselves of their sails, or make use of their anchors.

In this storm, on the 30th of September, the *Mari-gold*, Captain Thomas, was separated from them; and on the 7th of October, having entered a harbour, where they hoped for some intermission of their fatigues, they were in a few hours forced out to sea again by a violent gulf, at which time they lost sight of the *Elizabeth*, Captain Winter, whose crew, as was afterwards discovered, wearied with labour, and discouraged with the prospect of future dangers, recovered the straits the day following, and returning by the same passage through which they came, sailed along the coast of Brazil, and, in the year following, arrived in England.

They were now driven Southward 55 degrees, where they discovered a cluster of islands, in one of which they anchored and staid two days, to the great refreshment of the crew, having met with excellent water, and plenty of greens. Not far distant from this bay they entered another, where they beheld some naked inhabitants ranging along the coast in their canoes in search of provisions. With these they exchanged some toys for such refreshments as they had to supply.

And now, being furnished with wood and water, they again set sail, and were, by a new storm, driven to the latitude of 57 degrees, when they beheld the extremities of the American coast, and the confluence of the Atlantic and Southern oceans. Here they arrived on the 28th of October, and at last were blest with the sight of a calm sea, having, for almost two months, endured such a storm, as no voyager has given an account of, and such as in that part of the world, though accustomed to hurricanes, the inhabitants were unacquainted with.

On the 30th of October, they steered towards the place appointed for the rendezvous of the fleet, in case of separation, which was in 30 degrees South; and, on the next day, discovered two islands, so well stocked with fowls, that they victualled their ships with them. After this supply, they sailed northward, along the coast of Peru, till they came to 30 degrees, where, finding neither ships, nor any convenient port, they came to anchor November the 29th, at *Mucho*, an island inhabited by such Indians as the cruelty of their Spanish conquerors had driven from the continent, to whom they applied for water and provisions, offering them in return such things as they imagined most likely to please them. The Indians seemed willing to traffic; and, having presented them with fruits and two fat sheep, shewed them a place where they might come for water.

Next morning, according to agreement, the English landed with their water-vessels, and sent two men forward towards the place appointed, who, about the middle of the way, were suddenly attacked by the Indians and immediately slain. Nor were the rest of the company out of danger; for behind the rocks was lodged an ambush of 500 men, who, starting up from their retreat, discharged their arrows into the boat with such dexterity, that every one of the crew was wounded by them. The sea being then high, and hindering them from either retiring or making use of their weapons, Drake himself received an arrow under his eye, which pierced him almost to the brain; and another in his breast. The danger of these wounds was much increased by the absence of their surgeon, who was in the *Elizabeth*, so that they had none to assist them but a boy, whose age did not admit of much experience or skill; yet so much were they favoured by Providence, that they all recovered. No reason could be assigned for which the Indians should attack them with so furious a spirit of malignity, but that they mistook them for Spaniards, whose cruelties might very reasonably in-

cite those to revenge, whom they had driven, by incessant persecution, from their country, wasting immense tracts of land by massacre and devastation. *Nunõ de Sylva* adds, that none of the Indians were hurt by the English, though they came so near the boat, as to seize and carry off four of the oars.

On the afternoon of the same day they set sail, and on the 30th of November dropt anchor in *Phillip's bay*, where their boat, having been sent out to discover the country, returned with an Indian in his canoe whom they had intercepted. He was of a graceful stature, dressed in a white coat or gown, reaching almost to his knees; very mild, humble, and docile; such as perhaps were all the Indians, till the Spaniards taught them revenge, treachery, and cruelty. This Indian, having been kindly treated, was dismissed with presents; and informed, as far as the English could make him understand, what they chiefly wanted, and what they were willing to give in return; Drake ordered his boat to attend him, and set him safe on shore.

When he was landed, he made signs for the boat to wait till his return, and meeting some of his countrymen, gave them such an account of his reception, that, within a few hours, several of them repaired with him to the boat, with fowls, eggs, and a hog; and with them one of their captains, who willingly came into the boat, and desired to be conveyed by the English to their ship.

By this man Drake was informed that no supplies were to be expected here; but that Southward, in a place to which he offered to be his pilot, there was great plenty. This proposal was accepted, and on the 5th of December, under the direction of the good-natured Indian, they came to anchor in the harbour called by the Spaniards *Val Parizo*, in 33 deg. 40 min. S. latitude, near the little town of *St. Jago*, where they met not only with sufficient stores of provisions, and with storehouses full of the wines of *Chili*, but with a ship called the *Captain of Morial*, richly laden, having, together with large quantities of the same wine, some of the fine gold of *Baldivia* to the amount of three score thousand pezos, each pezo of the value of eight shillings, and a great cross of gold set with emeralds. The Spaniards at first, mistaking the English for friends, invited them to feast with them; but soon being undeceived, one of the crew jumped overboard, and alarmed the town; but the inhabitants, instead of making opposition, fled hastily, and left whatever was in the town a prize to the enemy. In the chapel Drake and his men found the most valuable booty.

Having spent three days here in storing their ships, and loading the money and effects, they departed, and landed their Indian pilot where they first received him, after having rewarded him much above his expectations or desires. They had now little other anxiety than for their friends, who had been separated from them, and whom they now determined to seek. But considering that, by entering every creek and harbour with their ships, they exposed themselves to unnecessary dangers, and that their boat could not contain such a number as might defend themselves against the Spaniards, they determined to station their ship at some place where they might commodiously build a pinnace, which, being of light burden, might safely sail where the ship would be in danger of being stranded; and, at the same time, carry a sufficient force to resist the enemy, and afford better accommodation than it was possible to obtain in the boat. To this end, on the 19th of December, they entered a bay near *Coquimbo*, a town inhabited by the Spaniards, who, discovering them immediately, issued out to the number of 100 horsemen, with about 200 naked Indians running by their sides. The English, observing their approach, retired to their boat without any loss, except of one man, whom no persuasions or intreaties could move to retire with the rest, and who was therefore overtaken by the Spaniards, who thought to have taken him prisoner, but, having an halbert in his hand, he manfully defended himself, till, being overpowered by numbers, he was run through the

body with a lance. The Spaniards, exulting at the victory, ordered the Indians to draw the dead carcass from the rock on which he fell, and in the sight of the English beheaded it, and then cut off the right hand, and tore out the heart, which they carried away in triumph.

Leaving this place, they soon found a harbour more secure and convenient, where they built their pinnace, in which Drake went to seek his companions; but, finding the wind contrary, he was obliged to return in two days.

From hence they came to a port called Sarcipaxa, where, being landed, they found a Spaniard asleep with silver bars lying by him to the value of 4000 Spanish ducats: notwithstanding the insults which they had received from his countrymen, they did not think fit to disturb this harmless man's repose, but, taking the silver, left him quietly to sleep out his nap.

Coasting along the shore, they observed a Spaniard driving eight Peruvian sheep, which on landing they found to be laden with silver, each sheep having 100lb. weight in two leather bags across his back. They delivered the poor animals of their heavy burdens, and lodged the bags in their own ships.

Farther on lay some Indian towns, from which the inhabitants repaired to the ship on floats made of seal-skin blown full of wind, two of which they fastened together, and, sitting between them, row with great swiftness, and carry considerable burdens. They very readily traded for glass and such trifles, with which the old and the young seemed equally delighted.

Arriving at Marmarena on the 26th of January, Drake invited the Spaniards to traffic with him, which they accepted; and supplied him with necessaries, selling to him, among other provisions, some of those sheep which have been mentioned, whose bulk is equal to that of a cow, and whose strength is such, that one of them can carry three tall men upon his back; their necks are like a camel's, and their heads like those of our sheep. They are the most useful animals of this country, not only affording excellent fleeces and wholesome flesh, but serving as carriers over rocks and mountains, where no other beast can travel; for their foot is of a particular form, which enables them to tread firm on the steepest and most slippery places.

On all this coast, it is said, the mountains are so impregnated with silver, that from one hundred weight of common earth five ounces of fine silver may be separated.

They continued their course towards the north, and on the 7th of February arrived at Arica, in 8 deg. 30 min. S. latitude, and in this port, found three small barks, in which they found 57 slabs of silver, each of the size and shape of an ordinary brick, and weighing about 20lb. They took no prisoners; for the crews, fearing no interlopers, were all on shore carousing with one another. At this port the Spaniards were wont to land their merchandize, and to embark the silver, which was transported from thence to Panama; but, since Drake's incursion, they carry their silver over land to Lima, and load no more treasure here, except what they pay for the purchase of such merchandize as is brought from Europe to supply their market. Wanting numbers to assault the town, they proceeded in their course, and falling in with a small coasting-vessel, laden with linen and other cloaths, Drake supplied his crew with what quantity of those articles they stood in need of, and dismissed the Spaniards with the remainder.

From hence they sailed to Chuli; in which port there was a ship that had 300,000 pezoës of silver in bars; but the Spaniards had sent an express from Arica, to acquaint the governor that Drake was upon the coast. This express arrived at Chuli, just two hours before Drake entered the port; in which time the master of the ship had thrown his treasure overboard, and had secured himself and crew on shore, leaving only one Indian on board to make the report. Drake, fearing the alarm would spread faster than he could sail, lost no time in hazardous searches, but in-

stantly departed, and steered for Lima, where they arrived on the 15th of February, and entered the harbour without resistance, in which, according to some writers, there were thirty sail of ships; others say, twelve; but all agree, that several of them were of considerable force: so that Drake's security consisted not in his strength, but in his reputation, which had so intimidated the Spaniards, that the sight of their own superiority could not rouse them to opposition. Instances of such panic terrors are to be met with in other relations; but as they are, for the most part, quickly dissipated by reason and resolution, a wise Commander will rarely ground his hopes of success on them; and, perhaps, on this occasion, the Spaniards scarcely deserve a severer censure for their cowardice, than Drake for his temerity. A writer of good authority, to reconcile the matter, tells us, that Drake took them at unawares, and that the crews, as is usual in times of perfect security, were with their families on shore; and many of those who were ready to sail, were taking leave of their friends. Be this as it may, all seem to agree, that Drake made here a considerable booty, having taken from one ship a chest full of rials of plate, which he found concealed under the steerage, and, from other ships, silks and linen cloth to a considerable value. He did not, however, remain long in this harbour, but hastened in pursuit of the Cacafuego, which ship had sailed but three days before, and which, they were here informed, was bound to Paita. In the pursuit, they fell in with another ship, out of which they took a large quantity of gold, together with a crucifix of the same metal, richly adorned with emeralds. They continued the pursuit; but, having gained intelligence, that instead of Paita, she was gone to Panama, Drake crowded all the sail he could, and, to encourage the pursuers, promised, that whoever first descended the prize should have his gold chain as a reward; which fell to the lot of his brother John. On the 1st of March they came up with her, and, after exchanging a few shot, they boarded her, and found not only a quantity of jewels, and thirteen chests of money, but eighty pounds weight of gold, and twenty-six tons of uncoined silver, with services of wrought plate to a great value. In unlading this prize they spent six days; and then dismissing the Spaniards, stood off again to sea.

Lopez Vaz, a Spanish writer, tells us, that, in less than 24 hours after their departure from Lima in pursuit of the Cacafuego, news was brought that Drake was upon the coast, but that the governor had already assembled the force of the country to oppose his landing; and that, finding he had left the harbour, he ordered three ships with six pieces of cannon (being all he could collect), and 250 men, to pursue him: but, the equipment of these vessels necessarily requiring time, Drake had gained the advantage of them; and, coming within sight of the prize off Cape Francisco, the Captain of which, Juan de Anton, a Biscayan, seeing at a distance a ship crowded with sail, and imagining the Viceroy of Peru had dispatched her on some message to him, struck his sails, and lay to till, Drake approaching nearer, he discovered his mistake. He would then have made his escape, but Drake, nearing him fast with his great ordnance, against which the captain could make no defence, he was constrained to yield. "There was in this ship, adds the Spaniard, eight hundred and fifty thousand pezoës of silver, and forty thousand pezoës of gold, all which silver and gold was customed: but what treasure they had uncustomed, I know not; for many times they carry almost as much more as they pay custom for; otherwise the king would take it from them, if they should be known to have any great sum; wherefore every ship carries a bill of custom, that the king may see it. All the treasure which Drake took was merchants and other mens goods, saving 180,000 pezoës of the king's. He had also out of this ship good store of victuals, with other necessaries, which were to be carried from Panama, and was five days in taking out such things as he needed."

"This done, he failed to the coast of New Spain, without going to Panama. The ships that were sent by the Viceroy of Peru from Lima, arrived off Cape St. Francisco 20 days after Drake had taken the Cacafuego, and had intelligence by a ship coming from Panama, which they met at the said cape, that Francis Drake had taken the ship with silver, and was not gone for Panama; whereupon the commander of the three ships, thinking that Captain Drake had been gone for the Straits of Magellan, directed his course that way to seek him."

Thus Drake, changing his course to the west, escaped his enemies, and fell in with a ship from the East Indies laden with silks, China ware, and cotton. The owner, a Spaniard, was on board, who presented Drake with a falcon wrought in massy gold, with an emerald, set in the breast of it, the largest he had ever beheld. With this present, and a golden cup from the pilot, Drake was contented, and dismissed the ship, taking only four chests of China ware, which at that time was of great value in Europe.

On the 13th of March they came in sight of land, which happened to be a small island about two leagues from the main continent. There they found a harbour, and anchored in five fathom water, where they staid till the 20th, on which day, a little coasting frigate passing by, was pursued by the pinnace, boarded, and taken. Being laden with saffaparilla, honey, butter, and other country goods, Drake unloaded the saffaparilla, and in the room of it put the gold and silver from his own ship, in order to heave her up, to new caulk her sides, and stop her leaks; in which service the crew were employed till the 26th of the same month, when having reloaded the cargo, and taken in a sufficient quantity of wood and water, they continued their course westward along the coast, taking the Spanish frigate with them to bear them company.

On April 6, a little before sun-set, they discovered a ship, that held on her course about two leagues to seaward from the main land. To this ship they gave chase, and before morning they neared her, and suddenly boarded her while the men slept. Being masters of this prize without resistance, they ordered the prisoners on board their own ship, among whom was one Don Francisco Xarate, who meant to sail to Panama, and from thence to China, with the letters and patents that were found in his possession (among which were the letters of the king of Spain to the governor of the Philippines); as also the sea charts wherewith they were to be directed in their voyage, which were of admirable use to Drake in his return home. From this ship they took great quantities of bale goods, and other valuable merchandize, and then dismissed her. They also took a young negroe girl, whom Drake or some of his companions having got with child, they afterwards inhumanly set her on shore on an island in their way home, just as she was ready to lie in; of which notice will be taken in its proper place. Having retained a Spanish pilot from this ship, they obliged him to direct them to a safe harbour, where they might supply themselves with provisions for their intended voyage. This man brought them to the harbour of Anguatulco, or, as others write, Guatalco, where arriving on the 13th of April, they staid till the 26th of the same month, and then set sail, having first dismissed all their Spanish prisoners, together with Nuno da Sylva, the Portuguese pilot, whom they brought from the Canaries, and who had served them faithfully in all their trials and dangers; in reward for which he was now abandoned by Drake to the mercy of the enemy. This man, when he landed on the continent, was first carried to Mexico, and there put to the torture to make discoveries. He was afterwards sent prisoner into Old Spain, and there examined; and, having given a faithful relation of all he knew, was released, and returned home to his own country, where he published, as has already been said, an account of the voyage as far as he went, which was afterwards translated into all the European languages, and universally read.

On their arrival at Anguatulco, they had no sooner

landed than Drake with part of his men marched up to the town, where they found the chief magistrate sitting in judgment upon a parcel of poor savages, and ready to pass sentence of death upon almost all of them, they being charged with a conspiracy to kill their masters, and set fire to the town. Drake changed the scene, and made judges and criminals without distinction, his prisoners, conducting them all in procession to his ship. Here he made the judge write an order to the commanding officer to deliver up the town, in which they found a great pot, says our author, as big as a bushel, full of rials of plate, a gold chain, and a few jewels. The gold chain was taken from a gentleman who was making his escape from the town, but was intercepted by an English sailor, who rifled him of all the valuables he had about him, of which the gold chain was thought to be of the least value.

Being now sufficiently enriched, and having given over all hopes of finding their associates, and, perhaps, beginning to be infected with that desire of ease and pleasure which is the natural consequence of wealth obtained by successful villainy, or, what is still more probable, being in fear of a surprize before they had secured their booty, they began to consult about their return home; and, in pursuance of Drake's advice, resolved first to find out some convenient harbour where they might more safely lie and equip themselves for the voyage, and then endeavour to discover a nearer passage from the South Seas into the Atlantic Ocean; a passage that would not only enable them to return home with full security, and in a shorter time, but would much facilitate the navigation into those parts, and of course immortalize their names.

For this purpose they had recourse to a port in the island of Canes, where they met with fish, wood, and fresh water; and, being sufficiently stored with other provisions, with which they had supplied themselves from their prizes and at Anguatulco, they set sail first with a resolution of seeking a passage by the north-west, and if that failed, by the Moluccas, and thence, following the course of the Portuguese, to return by the Cape of Good Hope.

In pursuance of the first resolution, they failed about 600 leagues, till coming into the latitude of 43 deg. north, they found the air so excessive cold, that the men could no longer bear to handle the ropes to navigate the ship: they, therefore, changed their course till they came into the latitude of 38 deg. and 30 min. under which height they discovered a very good harbour, and, fortunately, had a favourable wind to enable them to enter it.

Here, on the 17th of June, they cast anchor, and, in a short time, had opportunities of observing that the natives of that country were not less sensible than themselves; for, the next day, there came a man rowing in his canoe towards the ship, and, at a distance from it, made a long oration with very extraordinary gesticulations, and great appearance of vehemence; and, a little time afterwards, made a second visit in the same manner; and then returning a third time, he presented them, after his harangue was finished, with a kind of crown of black feathers, such as their kings wear upon their heads, and a basket of rushes filled with a particular herb, both which he fastened to a short stick, and threw into the boat: nor could he be prevailed upon to receive any thing in return, though pushed towards him upon a board, only he took up a hat that was flung in the water.

Three days afterwards, the ship, having received some damage at sea, was brought nearer to land, that her lading might be taken out; in order to which, the English, who had now learned not to commit their lives too negligently to the mercy of savage nations, raised a kind of fortification with earth and palisades, and erected their tents within it. All this was not beheld by the inhabitants without the utmost astonishment, which incited them to come down in crowds to the coast, with no other view, as it afterwards appeared, but to compliment the beautiful strangers that had condescended to touch upon their country.

Drake,

Drake, neither confiding too much in appearances, nor wholly distrusting the friendly disposition of the inhabitants, directed them to lay aside their bows and arrows, and, on their approach, presented them with linen and other necessaries, of which he shewed them the use. They then returned to their habitations, about three quarters of a mile from the English camp, where they made such loud and violent noises, that they were heard by the English, who had vanity enough to believe that they were paying them a kind of melancholy adoration.

Two days afterwards, they perceived the approach of a far more numerous company, who stood at the top of a hill which over-looked the English settlement, while one of them made a long oration, at the end of which all the assembly bowed their bodies, and pronounced the syllable Oh with a solemn tone, as by way of confirmation of what had been said by the orator. Then the men laying down their bows, and leaving their women and children on the top of the hill, came down towards the tents, and seemed transported in the highest degree at the kindness of Drake, who received their gifts, and admitted them to his presence. The women at a distance appeared seized with a kind of phrenzy, such as that of old among the Pagans in some of their religious ceremonies, and, in honour as it seemed of their guests, tore their cheeks and bosoms with their nails, and threw themselves upon the stones with their naked bodies.

Three days after this, on June 25, 1579, Drake received two Ambassadors from the Hioh, or King, of the country, who, intending to visit the camp, required that some token might be sent him of friendship and peace. This request was readily complied with; and soon after came the King, attended by a guard of about an hundred tall men, and preceded by an Officer of State, who carried a sceptre made of black wood, adorned with chains made of a kind of bone or horn, which are marks of the highest honour among them. Behind him was the King himself, dressed in a coat of beasts skins, with a crown woven with feathers upon his head. His attendants followed, dressed nearly in the same manner all but the crown; and after them came the common-people, with baskets platted so artificially that they held water, in which, by way of present, they brought roots and fish.

Drake, not lulled into security, ranged his men in order of battle, and waited their approach, who coming nearer, stood still, while the scepter-bearer made an oration; at the conclusion of which, they came again forward at the foot of the hill, and then the scepter-bearer began a song, which he accompanied with a dance, in both which the men joined, but the women danced without singing. Drake now distrusting them no longer, admitted them into his fortification, where they continued their song and dance a short time; and then both the King and some others of the company made a long harangue, in which it appeared, by the rest of their behaviour, that they entreated them to accept of the government of their country; and the King, with the concurrence of the rest, placed the crown upon Drake's head, graced him with the chains and other signs of authority, and saluted him with the title of Hioh. The kingdom thus offered, though of no farther value to him than that it furnished him with present necessities, Drake thought it not prudent for him to refuse; and, therefore, took possession of it in the name of Queen Elizabeth, not without ardent wishes that this acquisition might be of use to his native country. The kingdom being thus consigned, and the grand affair at an end, the common people left their King and his Nobles with Drake, and dispersed themselves over the camp; and when they saw any one that pleased them more than the rest, they tore their flesh and vented their outcries, as before, in token of reverence and respect. They then proceeded to shew them their wounds and diseases, in hopes, perhaps, of a miraculous cure; to which the English, to benefit and undeceive

them at the same time, applied such remedies as they used on like occasions.

They were now grown confident and familiar, and came down to the camp every day, repeating their ceremonies, till they were more fully informed how disagreeable they were to those whose favour they were so studious of obtaining. They then visited them without ceremony, indeed, but with a curiosity so ardent, that it left them no leisure to provide the necessities of life, with which the English were, therefore, obliged to supply them. They had, then, sufficient opportunity to remark the custom and disposition of these new allies, whom they found tractable and benevolent, strong of body far beyond the English, yet unfurnished with weapons either for assault or defence, their bows being too weak for any thing but sport. Their dexterity in taking fish was such, that, if they saw them so near the shore that they could come to them without swimming, they never missed them.

The same curiosity that had brought them in such crowds to the shore, now induced Drake and some of his companions to travel up into their country, which they found at some distance from the coast very fruitful, filled with large deer, and abounding with a peculiar kind of cunnies smaller than ours, with tails like rats, paws such as those of a mole, and bags under their chins, in which they carry provisions to their young.

The houses of the inhabitants were round holes dug in the ground, from the brink of which they raise rafters, or poles, shelving towards the middle, where they all meet in a ridge, and are cramp'd together; the people lie upon rushes, and make the fire in the middle of the house, letting the smoke fly out at the door. The men are generally naked; but the women make a kind of petticoat of bulrushes, which they comb like hemp, and throw the skin of a deer over their shoulders. They are very modest, tractable, and obedient to their husbands. The soil is but badly cultivated; but contentment seems to prevail in a very eminent degree among all ranks of this happy people.

The land was named by Drake New Albion, from its white cliffs, in which it bore some resemblance to his native country, and the whole history of the resignation of it to the English was engraven on a piece of brass, then nailed on a post, and fixed up before their departure, which being now discovered by the people to be near at hand, they could not forbear perpetual lamentations.

When the English on the 23d of July weighed anchor, they saw them climbing to the tops of hills, that they might keep them in sight, and observed fires lighted up in many parts of the country, on which, as they supposed, sacrifices were offered.

Near to this harbour, they touched at some islands where they found abundance of seals; and, despairing now to find any passage through the northern regions, they, after a general consultation, determined to steer away to the Moluccas; and, setting sail July 25, they held a western course for 68 days without sight of land; and, on September 30, arrived within view of some islands, about 20 degrees northward from the Line, from whence the inhabitants resorted to them in canoes hollowed in the middle, and raised at both ends so high above the water, that they seemed almost a semi-circle; they were burnished in such a manner that they shone like ebony, and were kept steady by a piece of timber fixed on each side of them. The first company that came brought fruits, bananas, and other things of no great value, with an appearance of traffic, and exchanged their lading for other commodities with great show of honesty and friendship. But having, as they imagined, laid all suspicion asleep, they sent another fleet of canoes, of which the crews behaved with all the insolence of savages, and all the rapacity of thieves; for, whatever was suffered to come into their hands, they seemed to consider as their own, and would neither pay for it nor restore it: and, at length, finding the English resolved to admit them no longer, they dis-

appearance before his Palace.*

charged a shower of stones from their boats, which insult Drake prudently and generously returned, by firing his great guns without hurting them; at which they were so terrified, that they leaped into the water, and hid themselves under their canoes.

Here we cannot help remarking how nearly this description agrees with the accounts given by the late navigators, of the temper and disposition of the inhabitants of the islands lately discovered between the Tropics. Drake, indeed, found the firing of his guns without hurting them, sufficient to intimidate these ignorant people; but our later voyagers have thought their vengeance not complete for any slight insult, without murdering them by wholesale to strike them with terror. The writer of the late voyages says, "Our men shewed as much impatience to destroy them as a sportsman to kill his game."

Having for some time but little wind, they did not arrive at the Moluccas till the 3d of November; and then, designing to touch at Tidore, as they coasted along the island Mutua, belonging to the King of Ternate, they were visited by his Viceroy, who informed them that it would be more advantageous for them to have recourse to his master for his supplies, than to the Portuguese, with whom he was at enmity. Drake was, by the arguments of the Viceroy, prevailed upon to alter his resolution; and, on November the 5th, cast anchor before Ternate. Scarce was he arrived, before the Viceroy, with others of the chief nobility, came out in three large barges rowed by forty men on each side, to conduct the ship into a safe harbour; and, soon after, the King himself, having received a velvet cloak by a messenger from Drake, as a token of peace, came with such a retinue and dignity of appearance, as was not expected in those remote parts of the world. He was received with discharges of cannon, and every kind of music, with which he was so much delighted, that he invited the performers on board his barge.

The King was of a graceful stature and royal carriage, of a mild aspect and low voice. His attendants were dressed in white cotton or callico, of whom some, whose age gave them a venerable appearance, seemed as counsellors, and the rest officers or nobles. His guards were not ignorant of fire-arms, but had not many among them, being equipped for the most part with bows and darts. The King, having spent some time in admiring the new objects that presented themselves, retired as soon as the ship was brought to anchor, and promised to return on the day following; and in the mean time the inhabitants, having leave to traffic, brought down provisions in great abundance. The King came not aboard, according to his promise, but sent his brother to excuse him, and withal to invite Drake ashore, proposing to stay himself as an hostage for his return. Drake declined going himself, but sent some gentlemen of his retinue in company with the King's brother, and kept the Viceroy till their return.

These gentlemen were received by another of the king's brothers, and conducted in great state to the castle, where there was a court of, at least, 1000 persons, among whom were threescore ancient men, privy counsellors to the king; and on each side of the gate without, stood four old men of foreign countries, who served as interpreters in commerce. In a short time appeared the King himself, dressed in cloth of gold, with his hair woven into gold ringlets, a chain of gold upon his neck, and on his fingers rings very artificially set with diamonds and jewels of great value. Over his head was borne a rich canopy; and by his chair of state stood a page with a fan set with sapphires, to moderate the excess of the heat. Here he received the compliments of the English, and then honourably dismissed them. The castle, which they had some opportunity of observing, seemed of no great force. It was built by the Portuguese, who, attempting to reduce this kingdom into absolute subjection, murdered the King, and intended to pursue their plot by the destruction of all his sons. But the general abhorrence which cruelty and perfidy naturally excite, armed the whole nation against them,

No. 48.

and procured their total expulsion from all the dominions of Ternate, which, from that time, increasing in power, continued to make new conquests, and to deprive them of other acquisitions.

Here they slept between four and five tons of cloves, intending to bring them to Europe. While they lay before Ternate, a gentleman came on board attended by his Portuguese interpreter. He was dressed somewhat in the European manner, and soon distinguished himself from the natives of Ternate, or any country they had ever yet seen, by his civility and quick comprehension. Such a visitant may easily be imagined to excite their curiosity, which he gratified by informing them that he was a native of China, of the family of the King then upon the throne; and that being accused of a capital crime, of which, though he was innocent, he had not sufficient evidence to clear himself, he had petitioned the Emperor that he might not be exposed to a trial; but that his cause might be referred to Divine Providence; and that he might be allowed to leave his country, with a prohibition against returning, unless heaven, in attestation of his innocence, should enable him to bring back to the King some intelligence that might be to the honour and advantage of the Empire of China. In search of such information he had now spent three years, and left Tidore for the sake of conversing with the English General, from whom he hoped to receive such accounts as would enable him to return with honour and safety. Drake, whether he credited or disbelieved his story, caused a recital to be made by one of the company, who talked the language of the interpreter, of such adventures and observations as he judged would be most pleasing to his visitor, to all which the Chinese Exile gave the utmost attention; and, having caused them to be repeated a second time, to impress them in his mind, thanked the Creator of the World for the knowledge he had gained. He then proposed to the General to sail to his country, to which he willingly undertook to be his pilot; but Drake could not be induced to prolong his voyage.

He therefore set sail, on November the 9th, in quest of a more convenient harbour, where he might clean and refit his ship, which, by the length of the voyage, and the heat of the climate, was now become foul and leaky. Directing his course southward, he soon fell in with an uninhabited island, which, by its appearance, promised fair to answer his purpose. At a distance it looked like a beautiful grove; the trees were large, straight, and lofty; but, what was more extraordinary, they were interpersed with such an astonishing number of shining flies, that the whole island in the night seemed to glow with fire. Here they found a convenient haven, and here they landed and continued 26 days. They found upon this island tortoise, but of a monstrous size, and various sorts of fruits of a delicious flavour.

Leaving this place on the 12th of December, they cruelly deserted the unhappy mulatto girl whom they had taken for their pleasure from a ship that fell into their hands on the coast of New Spain. They had, at the same time, taken on board a negroe youth, who they thought might be servicable to them in conversing with his nation in their way home; but, finding him of little or no use on board, and provisions beginning to fail, they pretended to send this simple couple far into the country to gather fruits, and, in the mean time, unmoored the ship, and hoisted sail; and, before the return of the victims, were out of sight of their tears, and out of hearing of their cries: a melancholy instance this of the depravity of man's heart, and of the relentless cruelty of minds addicted to rapine and lust. The poor girl, not yet fifteen, was ready to be delivered of an innocent babe; and the youth, not twenty, was the only resource in the midst of her distress. What befel them cannot be known: but Providence seemed to punish the perfidy of the crew by a severe trial of their fortitude soon after.

Having a wind not very favourable, they happened to be intangled among a multitude of islands, interspersed

5 G

with

with dangerous shallows, till January the 9th, 1580. When they thought themselves clear, and were sailing along with a brisk gale, they were, at the beginning of the night, suddenly surprized in their course by a sudden shock, the cause of which was instantly discovered, for they were thrown upon a concealed rock, and, by the speed of their course, fixed too fast for any hope of escaping.

Here the intrepidity of Drake was shaken, and his dexterity baffled: here all the horrors of mind, attendant on conscious guilt, concurred to aggravate the distresses of those who were instrumental in abandoning the harmless slaves. Those who were innocent reproached the guilty with being the authors of their present distresses; and, among the rest, Mr. Fletcher, the chaplain, exclaimed against the Captain, as one whose crimes of murder and lust had brought down divine vengeance on all the company. Drake, who knew well how to dissemble his resentment, judging this an improper time to encourage disputes, endeavoured, by every means in his power, to appease the increasing animosity. To preserve, therefore, the minds of the company at rest, he found it necessary to keep their hands employed, and, for that purpose, ordered the pumps to be constantly plied. Convinced by this experiment that the water did not gain upon them in the hold, he conceived hopes, that, by lightening the ship, they might possibly be able to heave her off. He knew it would be in vain to persuade them to part with their treasure, and, therefore, he first caused the guns to be thrown overboard, and then the spices; and, afterwards, the water casks to be bulged, being in hopes, that, if they could be released, water might again be supplied from the neighbouring islands, some of which were at no great distance. His next attempt was to discover about the shallows some place where they might fix an anchor, in order to bring their ship to, and, by that means, clear her from the rock: but, upon examination, it was found that the rock on which they had struck, rose, as many others in those seas do, almost perpendicular, and that there was no anchorage, nor any bottom to be fathomed a boat's length from the ship. But this discovery was by Drake wisely concealed from the common sailors, lest they should abandon themselves to despair, for which there was, indeed, much cause, there being no prospect left, but that they must there sink along with the ship.

In this deplorable situation they had remained for four and twenty hours, when Drake, finding all human efforts vain, addressed himself to his companions in distresses, and exhorted them to lay aside all animosities, and prepare themselves, by forgiving each other, for obtaining that mercy through Christ, which they could not hope to receive on any other terms. "On this occasion," says our author, "every thief reconciled himself to his fellow-thief, and Fletcher administered the sacrament to them all." At length, when their hopes had forsaken them, and no new struggles could be made, they were, on a sudden, relieved by the wind's shifting, and a fresh breeze springing up, which taking the ship on the leeward quarter, she reeled off the rock, without receiving any very dangerous hurt, to the unspeakable joy of every soul on board.

This was the greatest and most inextricable distress which they had suffered, and made such an impression upon their minds, that for some time afterwards they durst not adventure to spread their sails, but went slowly forward with the utmost circumspection, till, arriving at the fruitful island of Baretene, they entered the port to repair what damage the ship had received upon the rock. They found the people of this island of an amiable and obliging disposition, courteous in their manners, and honest in their dealings. They are finely proportioned, tall of stature, and of comely features. The men, in general, go naked; but the women cover themselves from the waist downwards, are modest, yet not insensible of love and pleasure. They found the island abounding with every necessary, and not a few of the comforts of life.

Having repaired the ship and refreshed the men,

they continued their course without any material occurrence till the 11th of March, when they came to anchor before the island of Java, and sending to the King a present of cloth and silks, received from him in return a present supply of refreshments; and on the day following Drake went himself on shore, and entertained the King with music, and obtained leave to store his ship with provisions. This island was governed by a great number of petty Kings or Rayas, subordinate to one Chief. Of these princes three came on board together a few days after their arrival, and having, upon their return, recounted the wonders they had seen, and the civilities with which they had been treated, incited others to satisfy their curiosity in the same manner; and Raya Denan, the chief King, came himself to view the ship, with the warlike armaments and instruments of navigation. This intercourse of civilities somewhat retarded the business for which they came; but, at length, they not only victualled their ship, but payed the bottom, which was the more necessary frequently to be repeated, as, at that time, sheathing of ships was not in practice.

The Javans were at this time a warlike people, well armed, with swords, targets, and daggers, forged by themselves, and exquisitely wrought. They were sociable, full of vivacity, and beyond description happy. They were likewise hospitable to strangers, and not at all addicted to thievery, the general characteristic of the islanders in the Pacific Sea.

From Java Drake intended to have visited the Malaccas, but his company became troublesome, being desirous of returning home. On this occasion he called to mind the speech of Master Fletcher, while they remained hopeless upon the rock, and, under pretence of his spurring up the people to oppose him, he caused him, says our author, "to be made fast by one of his legs with a chain, and a staple knocked fast into the hatches, in the forecabin of the ship. He called all the company together, and then put a lock about one of his legs; and Drake, sitting cross-legged on a chest, and a pair of pantofles in his hand, he said, Francis Fletcher, I do here excommunicate thee out of the Church of God, and from all the benefits and graces thereof, and I renounce thee to the devil and all his angels; and then he charged him, upon pain of death, not once to come before the mast; for, if he did, he swore he should be hanged, and Drake caused a posy to be written, and bound about Fletcher's arm, with charge, that if he took it off he should then be hanged; the posy was, FRANCIS FLETCHER, THE FALSEST KNAVE THAT LIVETH." It does not, however, appear how long he was obliged to wear this posy as it is called. But Drake was obliged to alter his resolution, and comply with the company's desires.

On the 25th of March, 1580, he therefore took his departure, and, on the 15th of June, they doubled the Cape of Good Hope, having then on board his ship fifty-seven men, and but three casks of water.

On the 12th of July they passed the Line, reached the coast of Guinea on the 16th, and on July the 22d arrived at Sierra Leona, after a most delightful passage, in which they discovered how much the Portuguese had abused the world in their false representations of the horrors and dangers that attended the navigation round the Cape. At Sierra Leona they staid two days to refresh the men, and, having furnished themselves with wood and water for the remainder of the voyage, they set sail for England in high expectation of enriching their country, with the spoils of the Spaniards.

On the 11th of September they made the island of Terara, and, on the third of November, they entered the harbour of Plymouth. In this voyage Drake surmounted the world, which no Commander in Chief had ever done before; and what, at that time appeared a thing extraordinary, by steering a western course they had lost a day in their account.

Their success in this voyage, and the immense wealth they brought home, raised much discourse throughout the kingdom; some highly commending, and some as loudly

loudly decrying the principles upon which it was acquired. The former alledged, that this enterprize was not only honourable to the Commander who conducted, and the crew who assisted in the performance of it, but to their country; that it would establish our reputation for maritime skill in foreign nations, and raise a laudable spirit of emulation at home; and that, as to the money, our merchants having suffered deeply by the treachery and villainy of the Spaniards in the new discovered country, there was nothing more just than that the nation should receive an equivalent by the reprisals which Drake and his company, at the hazard of their lives, had bravely extorted.

The other party argued, that Drake, in fact, was no better than a pirate; that, of all others, it least became a trading nation to countenance such depredations; that the expedition was not only a breach of all our treaties with Spain, but likewise of our old leagues with the House of Burgundy; and that the consequences would infallibly involve the Queen in a war, by which the nation would suffer infinitely more than the riches acquired by a single ship could counterbalance.

These were the sentiments, and these the speculations with which the different parties amused themselves for some time after the arrival of Drake in his native country. At length, the approbation of the Queen determined the dispute; for all acquiesced in the wisdom of their Sovereign.

Lopez Vaz, a Spanish writer, says, that Drake carried from the coast of Peru, 866,000 pezoës of silver, equal to 866 quintals, equal to 100 pound weight each quintal, amounting to 1,139,200 ducats. He also carried away 100,000 pezoës of gold, equal to 10 quintals, each quintal valued at 1500 Spanish ducats; and all this over and above the treasure in the ship, which was not entered, consisting of gold, silver, pearls, precious stones, coined money, and other things of great value. He also rifled the ships from the Philippines, laden with spices, silks, velvets, and other rich merchandize, the value not known.—By the above account, the silver only, at 4s. per oz. amounts to 259,800l. and the gold to 48,000l. sterling. But we have seen a manuscript that makes the value of the whole cargo brought home by the Golden Hind (for that was the name that Drake chose his ship, the Pelican, should be known by) amount to 800,000l. though that which was divided among the crew was only 80,000l. Is it not reasonable then to conclude, that the Queen and Council had a considerable share of the remainder?

On the 4th of April, 1581, her Majesty went to Deptford, and dined on board the ship in which so many Kings had been entertained before; and, after dinner, she conferred the honour of knighthood on her Commander; an honour not to be obtained in those days on trivial occasions, but as a reward for signal services. This mark of distinction was a full declaration of her Majesty's approbation, silenced Drake's enemies, and gave joy to his friends. She likewise gave directions for the preservation of the ship, that it might remain a monument of his own and his country's glory.

What contributed the more to render the fame of Drake illustrious, was the frequent attempts that had been made by navigators, the most renowned in their time, to achieve the same; but without success. In 1527 the Spaniards sent Gracca de Loaísa, a Knight of Malta, with a Squadron of seven ships to follow the rout of Magellan, who, though his ship returned to Spain, yet he himself lost his life, before he arrived at the Malaccas, the promised islands. Loaísa passed the straits, indeed, lost some of his ships in the South Seas, others put into the ports of New Spain, and only his own vessel and one more reached the East Indies, where himself and all his people perished.

In 1526, the Genoese sent two ships to pass the straits, of which one was cast away, and the other returned home without effecting any thing.

Sebastian Cabot, in the service of the crown of Portugal, made the like trial; but, not being able to find the straits, returned into the river of Plate.

Americus Vespútius, a Florentine, from whom the new world received its name, undertook to perform, in the service of the crown of Portugal, what Cabot had promised without effect; but that vain man was still more unfortunate: for he could neither find the straits, nor the river of Plate.

Some years after this, the Spaniards equipped a stout Squadron, under the command of Simon de Alcañara; but, before they reached the height of the straits, the crews mutinied, and obliged their Commander to return.

Such repeated miscarriages discouraged even the ablest and boldest seamen; so that from this time both Spaniards and others dropped all thoughts of emulating Magellan, till Drake conceiving his design, as has already been said, concealed it in his breast till ripe for execution.

Being now advanced to eminence, in 1585 he was employed in the Queen's service, and sent on an expedition to the West Indies as Commander in Chief; and having under him Captain Martin Forbisher, Captain Knollys, and other experienced Officers of the royal navy, he took St. Jago, St. Domingo, Carthagena, and St. Augustin. He returned elated with his success; but, as our author says, not much enriched by the plunder.

In 1587, he was again employed in an expedition to Lisbon, in which Captain Forbisher also bore a part. Here they gained intelligence that a considerable fleet was assembled in the bay of Cadiz, with a view to the forming an armament for the invasion of England; he immediately repaired to their place of rendezvous, and fell upon them at unawares; and, as it is said, burnt 10,000 tons of shipping, with all the stores which they were amassing for the intended invasion.

In their return they fell in with a carrack from the East Indies, richly laden, of which they likewise got intelligence in the port of Lisbon. This was the St. Philip, of which Linschoten gives the following account, when this Dutchman was at Goa, the chief settlement of the Portuguese in the East Indies: "There came in, he says, from the island of Japan, certain Jesuits, and with them three Princes, being the children of so many Kings of that country, wholly apparelled like Jesuits, not one of them above the age of 15 years, being minded by the persuasion of the Jesuits to visit Portingall, and from thence to go to Rome to see the Pope, thereby to procure great profit, privileges, and liberties for the missionaries in that island.

"In 1584, they set sail for Portingallo, and from thence travelled into Spain, where, by the King and all the Spanish nobility, they were with honour received, and presented with many gifts, which the Jesuits kept for themselves.

"Out of Spain, they rode to see the Pope; that done, they travelled throughout Italy, where they were much honoured, and presented with many rich presents, by means of the great report the Jesuits made of them.

"To conclude, they returned to Madrid, where with great honour they took their leave of the King, who furnished them with letters of recommendation to the Viceroy, and all the Portingall Governors of India; so they went to Lisbon, and there took shipping in 1586, and came to Goa in the ship called St. Philip, which ship, in her return to Portingall, was taken by Captain Drake, being the first that was taken coming from the East Indies; which the Portuguese took for an evil sign, because the ship bore the King's own name;" both Spain and Portugal being at that time governed by the same Sovereign.

"When the Princes and Jesuits of Japan arrived at Goa on their return from Europe, they were received, adds Linschoten, with great rejoicings; for it was verily thought they had all been dead. On their landing they were all three apparelled in cloth of gold and silver after the Italian manner, being the same the Italian noblemen and gentlemen had given them. They came to Goa very lively and in high spirits; and the Jesuits were not a little proud, that through their means the voyage had been

been successfully performed. In Goa they staid till the monsoon or time of the wind's setting in to sail for China, and thence to Japan, where, with great triumph and wondering of all the people, they were received and welcomed home, to the great furtherance of the Jesuits."

The St. Philip, in her voyage to Goa, had been driven by stress of weather into Malambique, where she met with the St. Laurence, homeward bound, that had likewise been driven into the same port disabled, having lost her masts, and received other considerable damage, by which she was rendered unserviceable. The St. Philip, therefore, as soon as she had landed her passengers at Goa, returned to Malambique, and took in the lading of the St. Laurence, which enabled her to make her voyage to Europe about the usual time; a circumstance fortunate for Drake, as it increased both his fame and his fortune.

In 1588, Drake was appointed Vice-Admiral, under Charles Lord Effingham Howard, High-Admiral of England, to oppose the formidable armada that had for three years before been secretly preparing in Spain for the invasion of England. In Drake's letter to Lord Treasurer Burleigh, acquainting him with the approach of the Spaniards, he concludes with this elegant compliment to his superior: "That, though the strength of the enemy out-went report, yet the cheerfulness and courage which the Lord Admiral expressed gave all who had the honour to serve under him assurance of victory;" a compliment which was the more admired in Drake, as in a former letter to the same Minister, in which he tells him of his gallant achievement in the port of Cadiz, "Not resting, said he, at Lisbon, we failed so close to the Spanish King, that we singed his beard;" a coarse metaphor, it must be owned, but strongly characteristic.

Drake's good fortune still accompanied him; for in the engagement which afterwards happened on the arrival of the armada, though he committed the greatest error that ever Commander was guilty of, by pursuing some hulks belonging to the Hans Towns for plunder, when he was entrusted to carry lights in the night for the direction of the English fleet, he mist the Admiral; yet he was the only Commander who profited most by the destruction of the enemy. Lord Howard, supposing the lights of the Spanish Admiral to be the lights which Drake was ordered to carry, was entangled in the very centre of the Spanish fleet, before he found his mistake; but, fortunately, night favouring his escape, he disengaged himself before he was discovered. This blunder was afterwards effaced by the gallant behaviour of Drake, than whom no man was ever bolder, or more determined. We do not, however, find his name among the Commanders whom the Lord High Admiral thought proper to thank for their services on that occasion. On the 2d of July, says Strype, Sir Francis, observing a large Spanish galleon, commanded by Don Pedro de Valdez, who was the reputed projector of the invasion, floating at a distance from both fleets, sent his pinnace to summon the Captain to surrender, who at first vauntingly set him at defiance; but being told it was Drake that required him to yield, he immediately struck his colours, and, with 46 of his crew, came on board the conqueror. In this ship he found 50,000 ducats, with other effects to a much greater amount.

The next year he was appointed Admiral of a squadron sent to place Don Antonio on the throne of Portugal, to which that Prince pretended to have a right. "But, says Rapin, (whose account of this expedition we shall follow) as the Queen was extremely frugal, and an undertaking against Spain could not but be very expensive, she so ordered it, that Drake and Norris took upon them to be at the charge, in hopes of making themselves amends by the booty they should meet with. So she only found them six ships of war, with a present of 60,000*l.* with leave to raise soldiers and sailors for the expedition. Drake had already tried the Spaniards in America and in the Channel, and was convinced they were more formidable in common opinion than in

reality; wherefore, joining with Sir John Norris, and some other private persons, they equipped a fleet, and embarked 11,000 soldiers and 1,500 marines. The Hollanders having also added some ships, the fleet consisted, according to Stow, of 146 sail, transports and victuallers included. Drake commanded at sea, and Norris was General of the land forces. They took with them Don Antonio, who hoped, by the assistance of the English to be put in possession of his kingdom, where he pretended to have many friends.

"They sailed from Plymouth on the 18th of April, and soon after arrived at the Groyne, where landing their troops, they assaulted the lower town, and carried it by storm. Then they besieged the upper town. But Norris, having advice that the Conde di Andrala was approaching with a body of troops to relieve the place, suddenly raised the siege to march against him; and, overtaking him, slew 3000 of his men. This done, he burnt several villages; and, without returning to the siege, re-embarked his troops, their principal design being against Portugal.

"Whilst they were sailing towards the coasts of that kingdom, they were joined by the Earl of Essex, with some ships he had armed at his own charge, unknown to the Queen. Some days after, they arrived at Panicha, a little town in Portugal, and, taking it, restored it to Don Antonio; from thence Norris marched by land to Lisbon, Drake promising to follow with the fleet up the Tagus. The army marched 40 miles without opposition; and encamping before Lisbon, took the suburbs of St. Catharine; but, as Drake performed not his promise; and the army wanted cannon and ammunition, it was resolved in a council of war to retire. This resolution was taken, because there was no appearance that the Portuguese were inclined to revolt, as Don Antonio had expected; and also, because there was no news of the succours he had boasted of from the King of Morocco. The army marching towards the mouth of the Tagus, met Drake, who had taken the town of Cascaes, and excused himself upon the impossibility of performing his promise. Some days after, the castle of Cascaes surrendering, it was blown up; and, to make themselves amends for the charges of the expedition, the English seized sixty vessels laden with corn, and all manner of naval stores to equip a new fleet against England, belonging to the Hans Towns. Then they went and took Vigo, which was abandoned by the inhabitants; and, firing the town, returned to England. This expedition did some damage to the King of Spain, but was of no benefit to Elizabeth; and the booty was not sufficient to pay for equipping the fleet, though Camden says, they brought home 150 pieces of heavy cannon, and a great booty. Above six thousand men perished in this expedition by sickness.

The writers of Drake's life say, that Norris grievously reproached Drake with breach of his promise, and charged the miscarriage of the expedition to his timidity. Indeed, Drake's good genius seems now to have forsaken him; and happy, say the same writers, if, having received this first check at play, he had withdrawn his stake.

As the war with Spain continued, Hawkins and Drake, who, as it should seem, wanted to continue their old game, where the profits were more, and the danger less, united their interest to persuade the Queen and Council to undertake an effectual expedition to the West Indies, by which the nation might be enriched, and the enemy deprived of those resources by which they were enabled to carry on the war.

For this purpose they procured, according to Rapin, twenty-six of the Queen's ships, the equipment of which, like the former, seems to have been supplied by private adventure; a practice at that time very common, where plunder was to be the reward. The preparations for this expedition, however, as it far exceeded all former enterprises to the American Indies, could not be made so privately, or conducted so secretly, but that the Spaniards found means to discover both its strength

strength and destination, and prepared themselves accordingly.

As the places that were to be attacked lay at a great distance, it was necessary to gain time, in order to fortify them. It was, therefore, found necessary to devise some expedient to prevent the failing of that formidable armament, till every thing was in readiness to oppose it. Accordingly, it was given out, that a second invasion was intended against England; and when the Spanish fleet was ready to sail for America, that had been equipping under pretence of an invasion, a sham attack was made upon Cornwall, in order to spread an alarm, and give it countenance.

This had the desired effect. It was thought improper to part with so many stout ships while the nation was threatened; and the expedition was therefore retarded, till the panic had subsided.

It was therefore the 28th of August, 1695, before the Commanders obtained permission to sail; and in the mean time the Queen having received advice that the plate fleet was safe arrived in Europe, and that only one ship, which had sprung her mast, remained behind, her Majesty acquainted them with the intelligence, and advised them to attack Porto Rico, before they pursued their grand enterprize, by which they might make themselves masters of the galleon without losing much time in the conquest.

Sir Francis Drake, who was not formed to act in conjunct expeditions, had not been long at sea before he differed in opinion from his fellow Commander, and pursued a project totally different from the first object of the voyage, in which, however, he was seconded by Sir Thomas Baskerville, Commander of the land forces. This scheme was to attack the Canaries in the way to America; in which, however, they failed; and spending necessarily much time in the island of Dominica in landing and refreshing the men, who, being unused to long voyages in hot climates, were many of them unfit to proceed, the Spaniards had so effectually prepared themselves, that, when the Generals came to action, they found an opposition very different from what they expected; and were soon sensible, that what they had formerly effected by surprize with a handful of sailors, was not now to be accomplished with a whole army of disciplined troops.

In their course to Porto Rico, one of the sternmost ships of the English fleet fell into the hands of five Spanish frigates that had been sent from Spain to convoy home the galleon from that port. From this ship they gained the intelligence of the intended attack, the consequences of which being foreseen by Sir John Hawkins, it threw him into a sudden disorder, of which in a few days he died—some say, of a broken heart.

They were now, November 12, 1595, before Porto Rico, and the same evening that Sir John Hawkins died, as the principal officers were at supper, a cannon-shot from the fort pierced the cabin, killed Sir Nicholas Clifford, wounded Captain Stratford, mortally wounded Sir Brute Browne, and struck the stool from under Sir Francis Drake, as he was drinking success to the attack.

The next day, pursuant to a resolution of a council of war, a general attack was made upon the shipping in the harbour, but without effect. The Spaniards suffered much, but the English more; who, finding it impossible to make an impression upon the fortifications of the town, weighed anchor, and steered to Rio de la Hacha, set fire to the town and burned it to the ground: they likewise performed some other exploits of the like kind; but having landed the troops destined to cross the isthmus to attack Panama, after a fatiguing march in which they were great sufferers, they returned, without being able to reach the place. This disappointment materially affected Drake, who having, as he thought, provided a sufficient force to carry into execution the enterprize which he had well-nigh effected with a few sailors and Symerons some years before, could not bear the thought of surviving his dis-

grace. "Now," says Fuller, began the discontent of Sir Francis Drake to feed upon him. He conceived, that expectation, a merciless usurer, computing each day since his departure, exacted an interest and return of honour and profit proportionable to his great preparations, and transcending his former achievements. He saw that all the good which he had done in his voyage, consisted in the evil he had done the Spaniards afar off, whereof he could present but small visible fruits in England. These apprehensions accompanying, if not causing, the disease of the flux, wrought his sudden death; and sickness did not so much untie his cloaths, as sorrow did rend at once the robe of his mortality asunder. He lived by the sea, died on it, and was buried in it.

This account of the manner of Sir Francis Drake's death seems to be authentic, though some have not scrupled to insinuate, that sickness had no part in that catastrophe. Be that as it may, Fuller's reflections upon it deserve to be remembered. "Thus," says he, we see how great spirits, having mounted to the highest pitch of performance, afterwards strain and break their credit in striving to go beyond it. Or, it may be, God oftentimes leaves the brightest men in an eclipse, to shew that they do but borrow their lustre from his reflection."

Thus we have endeavoured to trace the actions of this celebrated navigator from beginning to end. If we have withdrawn the veil, which has hitherto covered his infirmities, it has been in the pursuit of truth; not with a design to detract from his real merit, but to shew his character in the true light. In the current of success, even crimes of the deepest dye are sometimes patronised even by the public. The actions which gave rise to Drake's popularity, are such as a courageous leader, with an hundred armed followers, might in these peaceable times easily perform, by entering the cities or towns on the coast of Britain, in the dead of night, cutting the throats of the watch, and all who happen to be awake in the streets, breaking open and plundering houses, and churches, seizing every thing valuable that should fall into their hands, and, before the people could recover from their consternation, making their escape with their booty. Were such a company masters of an armed vessel, if there were no ship of force to oppose them, what should hinder their sailing from place to place, and, "provided they could outrun report," performing the like exploits in every town they came to? Would there be any thing truly great in this? Or would the man who should undertake and execute an enterprize of such a horrid nature, be justly entitled to the name of Hero? If not, what shall we say of Drake's nocturnal enterprize on Nombre de Dios; of his way-laying the treasure in the road from Panama; of his ranging the unarmed coasts of Chili and Peru; and of his plundering villages, towns, and ships belonging to a peaceable unsuspecting people; with whom his nation was at peace, and from whom opposition was not to be dreaded? What, indeed, did the people at that time say? Those who were the sufferers cried out loudly against the plunderer; and Bernardino de Mendoza, the Spanish Ambassador at the court of Queen Elizabeth, insisted that he should be punished for his robberies, and that all the money and effects he had seized should be restored; but, if the Queen was a private adventurer, as, from Drake's declaration to his followers, and from other instances of the womanish littlenesses of that Princess, there is reason to suspect, What hope was there of justice or restitution from remonstrance? Indeed, it served that avaricious Queen for a pretence to sequester the treasure which Drake brought home, and to convert, it is probable, the greatest part of it to her own use; for, as we have already shewn from good authority above, though the whole booty was valued at 800,000*l.* yet only 80,000*l.* was divided among the plunderers; and Rapin tells us, that some part of the treasure was afterwards repaid by the Queen to Spain. If she had not retained enough in her hands, no one will suppose, that the Sovereign, who

who could cause the goods of her favourite Leicester to be set to public sale after his death, for the payment of money she had lent him, would have repaid to Spain from her own coffers the plunder that had been unjustly taken by one of her meaner subjects.

To dignify actions, therefore, of the most infamous piracy with the name of great, is to exalt vice, and to substitute successful villainy in the place of substantial virtue. If we view Drake in the light of a courageous plunderer, he may vie with the De la Poles, the Blackbeards, or any of those daring disturbers of the times in which they lived, who struck a panic wherever they roved to commit their ravages: but, consider him as a Commander, employed in the defence of his country, and we shall see nothing to admire, except his courage. In the first enterprize in which he was engaged, he was indeed successful. The Queen, suspecting an intention in Philip of Spain to revenge the injuries his subjects had received, pitched upon Drake, who had given the offence, as the fittest man to prevent the consequences. He, therefore, as he had done before, attacked the enemy by surprise, and set fire to a defenceless number of transports assembled in the harbour of Cadiz, without a ship of war to protect them, or a gun fired by way of opposition. The accident which afterwards threw the rich India ship in his way, on his return home, did him no honour as a Commander, though it gave him credit as a fortunate adventurer: nor did his behaviour in the Channel, when, instead of maintaining his post, he pursued the Hans merchant ships, add at all to his reputation as a Vice-Admiral. His American enterprize with Lord Carlisle was attended with no laurels; and the only two enterprizes in which he was employed in a joint command, he ruined by his perfidy and self-conceit.

It may, indeed, be urged in Drake's defence, that it was the policy of the Queen his Sovereign, to countenance her subjects in distressing Spain, and in mortifying the haughty monarch who sat upon the throne; and that almost all the heroes of her active reign, acquired their glory by practices founded on the same prevailing principle.

This argument in his favour cannot be denied its due weight. The expeditions of Sir John Hawkins; of Sir Walter Raleigh; of Lord Carlisle; of Sir John Norris; of the Earl of Essex; of Cavendish; and, indeed, of most others undertaken against Spain, were professedly with a view to plunder; and the charges of fitting them out were chiefly borne by those who were to be sharers in the booty: yet, surely, there is a mate-

rial difference between the glory that is purchased by valour in the field, and fame that is acquired by compacts to surprize the innocent, and invade the property of the peaceable.

Having now seen Drake in two distinct points of view, as a leader of a company of plunderers, and as a Commander in the royal navy, let us do justice to his character by viewing him as a mariner, and in that light he will hardly have his equal. To project a voyage round the globe, and to conduct it without the assistance of a single mariner on board who had ever crossed the Line, Nuno da Silva, the Portuguese pilot, excepted, was, perhaps, one of the boldest exploits that ever man performed. His navigating his ships along the coast of Brazil; his carrying them through the straits of Magellan in a shorter time than any mariner has ever done since; his keeping the sea in a storm for thirty days together; his skill in navigating the coasts of Chili, Peru, and New Spain, where no English ship had ever sailed; his accuracy in discovering the track of the Spanish ship from the East Indies, and his consummate sagacity in pursuing a new course home to avoid pursuers; cannot be enough admired or applauded. His knowledge of the globe is manifest from the first attempt he made to return home by a northern passage; a passage which he knew would not only secure him from the danger of pursuers, but, were it practicable, would open a free intercourse between his nation and the rich inhabitants of that opulent country in which he was then situated. Finding himself, however, disappointed in this design, how great was his sagacity in the discovery of an unknown country, wherein to repair his ship, refresh his followers, take in wood and water, and to supply himself with every necessary for the vast voyage by sea he was to encounter; and yet, such was his knowledge in making provision against every contingency that might happen, that he lost but one man by sickness during the long run from the coast of New Spain to the Ladrões, in which Commodore Anson lost near half his crew. Nor is his skill less to be admired in his return from the Ladrões, the most dangerous navigation of any part of the known world; for, except the accident upon the rock, as has already been related, he sailed from the Ladrões to Java unembarrassed; from Java to Sierra Leona, on the coast of Africa, without touching at any port, or encountering any difficulty, save from a scarcity of water; a thing hardly to be credited, and which was never performed by any mariner before his time, or since.

A NEW, AUTHENTIC, and COMPLETE HISTORY of
CAPTAIN COOK's
Third and Last VOYAGE
TO THE
PACIFIC OCEAN:

Undertaken, Pursuant to his MAJESTY's Order,
By the said CAPT. JAMES COOK,
HAVING UNDER HIS COMMAND
Samuel Clerke, John Gore, and James King, Esquires;
In his Britannic MAJESTY's Ships,
The RESOLUTION and DISCOVERY:

Being Written in a more pleasing and elegant Stile than any other Work of the Kind; and including all the various important Discoveries, Facts, Incidents, and Circumstances, related in a satisfactory Manner.

CONTAINING

From the 12th of July 1776, to the 4th of October 1780, Inclusive,

A Period of four Years and nearly three Months:

And comprehending a great Variety of interesting Particulars, entirely unnoticed in other Narratives, and which consequently renders all other Works of this Kind spurious and incomplete.

Which Voyage was the Last, under the Direction of that able and much to be lamented Navigator, Captain Cook, with the View of making new Discoveries in the Northern Hemisphere; and, particularly, in order to ascertain the Practicability of a North-West Passage from Europe to the East Indies, between the Continents of Asia and America; and the Position, Extent, and Distance of which, he was likewise to determine.

TOGETHER WITH

A genuine and copious Account of the Death of the Captains Cook, and Clerke:—Captain Cook having explored the Coast of America, from 42 deg. 27. min. to 70 deg. 40 min. 57 sec. North latitude, was killed by the Natives of a new discovered Island in the South Sea, on the 14th of February 1779; and was succeeded by Captain Clerke, who died at Sea, of a lingering Illness, August the 22nd 1779; after which melancholy Events, Captain Gore took the command of the Resolution, and Mr. King, her first Lieutenant, was promoted to that of the Discovery: the Whole being (not an Abridgement but an entire original Narrative) extracted faithfully from the Original Journals of several Officers, and Private Papers; and illustrated with the greatest Variety of curious and splendid Copper-Plates, consisting of Portraits, Perspective Views, Landscapes, Historical Pieces, and most striking Representations of remarkable Events, natural Curiosities, &c. all taken during the Voyage, and now engraved by the most capital Artists of this Kingdom; together with all the Maps, Charts, Plans, &c. shewing the Tracts of the Ships, and relative to Countries now first discovered or hitherto but imperfectly known.

INTRODUCTION.

WE are now about to enter a new field for discovery and improvement; no less than to fix the boundaries of the two continents that form the grand divisions, which, though separated to all human appearance, connect the Globe: and in order to shew the importance of the present voyage, and to furnish our numerous friends, subscribers and readers, with an idea

of the magnitude of the undertaking, we shall take a cursory view of that untrodden ground, which former enterprising discoverers visited, and whereon the principal scenes of their operations were exhibited. A brief recapitulation of their expeditions, will evince plainly, how much we are indebted to those intrepid naval officers of our own country, who have extended

our

our acquaintance with the contents of the Globe, opened new channels to an increase of knowledge, and afforded us fresh materials, equally interesting, as they are uncommon, for the study of human nature in various situations. Columbus and Magellan, two illustrious foreigners, rendered their names immortal, at an early period. The former, by a perseverance, of which there was no precedent, very providentially surmounted every obstacle that opposed his progress, and astonished Europe with the production of a New Earth, since called America; while much about the same time the latter, inspired by a like spirit of enterprize, and animated by a magnanimity that despised danger, opened a passage to a new sea, to which he gave the name of Pacific.

In the year 1520, on the 6th of November, Magellan entered the straits, that have ever since been called by his name, and on the 27th of the same month beheld the wished for object of his pursuit, the Great Southern Ocean. For one hundred and thirteen days, he continued steering to the north-west, and having in that time crossed the line, he fell in with those islands, to which he gave the name of Ladrões; and proceeding from hence in search of the Maluccas, he found in his way many little islands, where he was hospitably received, and where a friendly correspondence was established. These islands were situated between the Ladrões, and what are now known by the name of the Philippines, in one of which, called Nathan, Magellan, with 60 men, encountering a whole army, was first wounded with a poisoned arrow, and then pierced with a bearded lance. His little squadron, now reduced to two ships, and not more than 80 men, departed hastily, but one only, the *Victory*, returned by the Cape of Good Hope, and was the first ship that ever went round the world. Other adventurers were not now wanting to follow the steps of this intrepid Navigator.

In 1567, Alvarez de Mendamo, another Spaniard, was sent from Lima, on purpose for discovery. He sailed 800 leagues westward from the coast of Peru, and fell in with certain islands in the latitude of 11 deg. S. and captain Cook inclines to the opinion, that they are the cluster which comprizes what has since been called New Britain, &c. Mendamo was also said to have discovered, in 1575, the island of St. Christoval, and not far from thence, the Archipelago, called the islands of Solomon, of which great and small he counted 33.

In 1577, Sir Francis Drake, who was the first Englishman that passed the straits of Magellan, discovered the island of California, which he named New Albion. He also discovered other small islands in his route to the 43d deg. of N. latitude, but as his sole view was to return with his booty, he paid no regard to objects of less concern. He arrived in England, by the Cape of Good Hope, in the year 1580. To him succeeded Sir Thomas Cavendish, who likewise passed the straits of Magellan in 1586, and returned nearly by the same route pointed out by his predecessor, touching at the Ladrões, and making some stay at the Philippine isles, of which, on his return, he gave an entertaining description.

In 1595, the Spaniards, intent more on discovery than plunder, fitted out four ships, and gave the command to Alvaro Mendana de Neyra; whose discoveries were the Marquesas, Solitary Island, and Santa Cruz: but most of those who embarked on this expedition either died miserably, or were shipwrecked. One of the fleet was afterwards found with all her sails set, and the people rotten.

In 1598, Oliver Van Noort passed the straits. He made no discoveries: but in this year the Sebaldine islands were discovered by Sebald de Wert, the same known now by the name of Falkland's Isles.

In 1605 Pedro Fernando de Quiros conceived the design of discovering a southern continent. He is supposed by Mr. Dalrymple and others, to have been the first into whose mind the existence of such a continent had ever entered. On the 21st of December he sailed from Calloa with two ships and a tender. Luis Paz de Torres was entrusted with the command, and Quiros,

from zeal for the success of the undertaking, was contented to act in the inferior station of pilot.

Quiros, soon after his return, presented a memorial to Philip II. of Spain, in which he enumerates 23 islands that he had discovered, among which was the island of the Virgin Mary, and adjoining to it three parts of the country called Australia del Espíritu Santo, in which land were found the bay of St. Philip and St. Jago.

In 1614 George Spitzbergen, with a strong squadron of Dutch ships passed the straits of Magellan; and in 1615 Schouten and Le Maire, in the *Unity* of 360 tons, and the *Hoorn* of 110, sailed from the Texel, on the 14th of June, professedly for the discovery of a new passage to the South Sea. The *Hoorn* was burnt, in careening, at King's island, on the coast of Brazil, and the other left singly to pursue her voyage. In latitude 54 deg. 56 min. they came in sight of an opening, to which, (having happily passed it) they gave the name of Strait le Maire. Having soon after weathered the southernmost point of the American continent, they called that promontory Cape Horn, or more properly Hoorn, after the town in Holland where the project was first secretly concerted; and two islands which they had passed, they named Bernevelt. They also discovered several others, and coasted the north side of New Britain.

In 1642 Abel Tasman sailed from Batavia in the *Heemskirk*, accompanied by the *Zee Haan* pink, with a design of discovering the Southern Continent. The first land he made was the eastern point of New Holland, since known by the name of Van Dieman's Land. Proceeding in a high latitude to the eastward, he fell in with the westernmost coast of New Zealand, where the greatest part of the crew of the *Zee Haan* were murdered by the savages of a bay, to which he gave the name of Murderer's Bay, called by our late navigators Queen Charlotte's Sound. In his passage he fell in with the isles of *Pylstaert*, *Amsterdam*, *Middleburg*, and *Rotterdam*. Then directing his course to the N. W. he discovered eighteen or twenty small islands, in latitude 17 deg. 19 min. S. longitude 201 deg. 35 min. to which he gave the name of Prince William's Islands, and *Heemskirk's Banks*. From thence Tasman pursued his course to New Guinea, without discovering the supposed continent; and returned to Batavia on the 15th of June 1643.

In 1681 Dampier passed the Magellanic Straits, and in 1699 he made a second voyage on discovery, which was chiefly confined to New Holland, New Guinea, New Britain, and the islands adjacent. In 1703, he performed a third voyage, but without making any new discoveries. He was accompanied in this voyage by Mr. Funnell, to whom the circumnavigation of the Globe is ascribed.

In 1721, the Dutch East-India Company, at the instance of captain Roggewein, fitted out a respectable fleet, for the discovery of that continent, which lay hitherto unknown, though believed universally to exist. Three stout ships were appointed, and were well provided for this service; the *Eagle* of 36 guns and 111 men, on board of which embarked Roggewein as commodore, having under him captain Colster, an experienced navigator; the *Tienhoven* of 28 guns, and 100 men, of which captain Bowman was commander; and the *African Galley*, commanded by captain Rosen-thall. From these experienced navigators every thing was hoped. They found the straits of Magellan impracticable, and entered the Southern Ocean, after having endured a variety of difficulties and hardships, by the strait le Maire. Roggewein pursued nearly the same track as Schouten had pointed out, till, veering more to the north, he fell in with the islands at which commodore Byron first landed, and where some of the wreck of the *African Galley*, as we have mentioned in the history of his voyage, was actually found. Pursuing their course to the westward, they discovered a cluster of islands, undoubtedly the same now called the Friendly Isles, to which

which they gave the name of the Labyrinth, because it was with difficulty they could clear them. They continued their course towards New Britain, and New Guinea; and thence by the way of the Moluccas to the East Indies; and thus ended, like all the former voyages, one which was expected at least to have solved the question, but, in fact determined nothing: yet they who argued from the harmony observable in the works of nature, insisted that something was wanting to give one side of the globe a resemblance to the other; while those who reasoned from experience, pronounced the whole system the creature of the fertile brain.

In 1738 Lazier Bouvet was sent by the East India Company, upon discovery in the Southern Atlantic Ocean. He sailed from Port l'Orient on the 19th of July, on board the *Eagle*, accompanied by the *Mary*, and on the 1st of January following, it was thought he had discovered land in latitude 54 deg. south, longitude 11 min. east. But this having been diligently fought for by captain Cook, without effect, there is good reason to doubt if any such exists; or, if it does, it is too remote from any known tract to be of use to trade or navigation. In 1742 commodore Anson traversed the Great Pacific Ocean; but he made no discoveries within the limits of our review.

We come now to that interesting æra, when the spirit of discovery recovered new strength, under the cherishing influence and munificent encouragement of his present Majesty, George III. who having put a period to the destructive operations of war, he turned his attention to enterprises more adapted to the season of returning peace. His Majesty formed the grand design of exploring the Southern Hemisphere; and in the prosecution of an object so well adapted to the views of a great commercial people, one voyage followed another in close succession.

In 1764, Captain, now admiral Byron, having under his command the *Dolphin* and *Tamar*, passed through the straits of Magellan, into the Pacific Ocean; where he discovered several islands, and returned to England in May, 1766. In the month of August following, the *Dolphin* was again sent out under the command of captain Wallis, with the *Swallow* sloop, commanded by captain Carteret. They proceeded together till they came to the west end of the straits of Magellan, and in sight of the Great South Sea, where they were separated. Captain Wallis directed his course more westerly than any navigator had done before in so high a latitude; discovered not less than fourteen new islands; and returned to England with the *Dolphin*, in May 1768. His companion captain Carteret kept a different route, made other discoveries, among which was the strait between New Britain and New Ireland. He returned with the *Swallow* to England, after having encountered innumerable difficulties, in March 1769. In the same year and month, commodore Bougainville, having circumnavigated the globe, arrived in France.

In 1769, the Spaniards sent out a ship to trace the discoveries of the English and French commanders, which arrived at Otaheite in 1771. This ship touched at Easter Island, but whether she returned to New or Old Spain remains undecided. In the same year 1769, the French also fitted out another ship from the Mauritius, under the command of captain Kerguelen, who, having discovered a few barren islands, contented himself with leaving some memorials, that were found by Captain Cook. To this distinguished navigator was reserved the honour of being the first, who from a series of the most satisfactory observations, beginning at the west entrance of the strait of Magellan, and carried on with unwearied perseverance round Terra del Fuego, through the strait of Le Maire, has constructed a chart of the southern extremity of America, from which it will appear, what advantages will now be enjoyed by those who shall hereafter sail round Cape Horn. Captain Cook sailed from Plymouth, in August 1768, and returned home by the Cape of Good Hope in July 1771. This experienced circumnavigator performed his second voyage in the *Resolution* and *Adventure*. These

two ships sailed from England in July 1772, and returned on the 30th of the same month, in 1775. The general object of this and the preceding voyage round the world, undertaken by the command of his Majesty, was to search for unknown tracts of land that might exist within the bosom of the immense expanse of ocean that occupies the whole southern hemisphere; and, particularly, to determine to a certainty, the existence or non-existence of a Southern Continent: and these voyages have facilitated the access of ships into the Pacific Ocean, and also greatly enlarged our knowledge of its contents. Our late navigators, besides perfecting many of the discoveries of their predecessors, have added to them a long catalogue of their own. The several lands, of which any account had been given by the Spaniards or Dutch, have been carefully looked for, and most of them found, visited, and accurately surveyed. The boasted *Tierra Australis del Espíritu Santo* of Quiros, as being a part of a southern continent, could not stand captain Cook's examination, who sailed round it, and assigned its true position, and moderate bounds, in the Archipelago of the New Hebrides. Bougainville did no more than discover, that the land here was not connected; but captain Cook found it to be composed of islands, and explored the whole group. Byron, Wallis, and Carteret, had each of them contributed towards increasing our knowledge of the amazing profusion of islands that exist in the Pacific Ocean, within the limits of the southern tropic: but how far that ocean reached to the west, what lands bounded it on that side, and the connection of those lands with the discoveries of former navigators, remained absolutely unknown, till captain Cook decided the question, and brought home such ample accounts of them and their inhabitants, as have left little more to be done in that part of the globe. It was a favourite conjectural opinion among geographers, that New Zealand was a part of a southern continent; but captain Cook's voyage in the *Endeavour* has proved it to be a mere supposition; for he spent near six months upon its coasts, circumnavigated it completely, and ascertained its extent and divisions into two islands. Whether New Holland did or did not join to New Guinea was another question, which captain Cook decided, by sailing between them through Endeavour strait. He, therefore, in this part of his voyage, has established a fact of essential service to navigation, by opening, if not a new, at least an unfrequented and forgotten communication between the Southern Pacific and Indian oceans. To captain Carteret we are indebted for a new discovery, in the strictest sense of the word. St. George's channel, through which his ship found a way, between New Britain and New Ireland, is a much better and shorter passage, whether eastward or westward, than round all the islands and lands to the northward. Thus far, therefore, the late voyages of our own countrymen, to disclose new tracks of navigation, and to reform old defects in geography, appear to have been prosecuted with a satisfactory degree of success.

But something was still wanting to complete the great plan of discovery. The utmost accessible extremities of the Southern Hemisphere had been repeatedly visited and surveyed; yet great variety of opinion prevailed concerning the navigable boundaries of our own hemisphere; particularly, as to the existence, or at least as to the practicability of a northern passage between the Atlantic and Pacific oceans, either by sailing eastward, round Asia, or westward, round North America; by which passage, could it be found, voyages to the East Indies in general would be much shortened, and, consequently become more profitable, than by making the tedious circuit of the Cape of Good Hope. This favourite object of the English as early as the fifteenth century, appeared so certain to the Cabots, that the younger Sebastian made the original attempt to discover a N. W. passage in 1497, which ended in the discovery of Newfoundland, and the Labrador coast. He returned by the way of Newfoundland, bringing home with him two Esquimaux. In

1576 Sir Martin Forbisher undertook a second expedition, and found a strait on the southernmost point of Greenland, but, after repeated trials, he relinquished his hope of seeing the object he held in contemplation and had been pursuing. Sir Humphry Gilbert was mortified with the same disappointment. He coasted along the American continent from the 60th degree of northern latitude, till he fell in with the Gulph of St. Lawrence; took possession, in his Sovereign's name, of that land, since called by the French Canada; and was the first who projected and promoted the establishment of the fishery in Newfoundland. Captain John Davis made three trials for a passage N. W. each of which proved unfortunate and unsuccessful. In his progress he passed the strait that still bears his name, and advanced as high as the latitude of 66 deg. Mr. Henry Hudson, in the year 1610, projected a new course towards the N. W. which brought him to the mouth of the bay that now bears his name. But the adventure ended, by the mutiny of his crew, in the tragical death of the Captain, and seven of his sick followers. The year following Sir Henry Button undertook the task, but with no better success than his predecessor. He was followed by James Hall and William Baffin. Hall in this fruitless expedition fell by the hands of a savage; and Baffin who renewed the pursuit in 1615, examined a sea that communicates with Davis's strait, which he found to be no other than a great bay, and called it after his own name: an inlet to the north, in latitude 78 deg. he called Smith's sound. In 1631 Luke Fox made a voyage in search of the same supposed passage, but to as little purpose as the rest. He was followed by Captain James, who, after the most elaborate search, changed his opinion, and declared that no such passage existed. Thus our countrymen and the Dutch have been equally unsuccessful in various attempts to find this passage in an eastern direction. Wood's failure in 1676 seemed to have closed the long list of unfortunate northern expeditions in that century; and the discovery, if not absolutely despaired of, by having been missed so often, ceased, for near another century, to be sought after: but Mr. Dobbs once more recalled the attention of this country to the probability of a N. W. passage through Hudson's Bay; in consequence of which captain Middleton was sent out by government in 1741, and captains Smith and Moore, by a private society, in 1746, each encouraged by an act of parliament passed in the preceding year, that annexed a reward of twenty thousand pounds to the discovery of a passage: however, they all returned from Hudson's Bay with reports of their proceedings, that left the attainment of the great object in view, at as great a distance as ever.

But it was not yet certain, that such a passage might not be found on the western side of America; and researches of this kind were no longer left to the solicitation, or to the subscriptions, of private adventurers; they engaged royal attention, and, in the present reign, were warmly promoted by the minister at the head of the naval department: and hence it was, that while captain Cook was prosecuting his voyage towards the South Pole, in 1773, Lord Mulgrave failed with two ships, to determine how far navigation was practicable towards the North Pole. And that nothing might be left unattempted, though much had been already done, captain Cook, whose professional knowledge could only be equalled by the persevering diligence with which he had employed it in the course of his former researches, was called upon once more to resume, or rather to complete his survey of the globe. This brave and experienced commander might have spent the remainder of his days in the command to which he had been appointed in Greenwich hospital; but he cheerfully relinquished this honourable station, and, in 1766, undertook for the service of his country another voyage, which, in one respect, was less fortunate than any former expeditions, being performed at the expence of the precious and most valuable life of its conductor. Former circumnavigators had returned to Europe by the Cape of Good Hope; the arduous task was now assigned

to captain Cook of attempting it by reaching the high northern latitudes between Asia and America. He was ordered to proceed to Otaheite, or the Society islands, and then having crossed the equator into the Northern Tropic, to hold such a course as might best probably give success to the attempt of finding out a northern passage: but that our readers may be enabled to judge with precision of the great outlines of the present important voyage; of the various objects it has in view, and how far they have been carried into execution, we shall here insert a true copy of the Instructions to captain Cook, from the Commissioners for executing the Office of Lord High Admiral of Great Britain, Ireland, &c. and which in substance were as follow.

"Whereas the earl of Sandwich has signified to us his Majesty's pleasure, that an attempt should be made to find out a northern passage by sea from the Pacific to the Atlantic Ocean; and whereas we have in pursuance thereof, caused his Majesty's sloop Resolution and Discovery to be fitted, in all respects, proper to proceed upon a voyage for the purpose above mentioned, and, from the experience we have had of your abilities and good conduct in your late voyages, have thought fit to intrust you with the conduct of the present intended voyage, and with that view appointed you to command the first mentioned sloop, and directed captain Clerke, who commands the other, to follow your orders for his further proceedings: you are hereby required and directed to proceed with the said two sloops directly to the Cape of Good Hope, unless you shall judge it necessary to stop at Madeira, the Cape de Verd, or Canary Islands, to take in wine for the use of their companies; in which case you are at liberty so to do, taking care to remain there no longer than may be necessary for that purpose: and on your arrival at the Cape of Good Hope, you are to refresh the sloop companies with as much provisions and water as can be conveniently stowed.

"If possible, you are to leave the Cape of Good Hope by the end of October, or beginning of November next, and proceed to the southward in search of some islands said to have been lately seen by the French, in the latitude 48 deg. south, and under, or near the meridian of Mauritius. In case you find those islands, you are to examine them thoroughly for a good harbour; and upon discovering one, make the necessary observations to facilitate the finding it again; as a good port, in that situation, may hereafter prove very useful, although it should afford little or nothing more than shelter, wood, and water. You are not, however, to spend too much time in looking out for those islands, or in the examination of them, if found, but to proceed to Otaheite, or the Society isles, (touching at New Zealand in your way thither, if you should judge it necessary and convenient) and taking care to arrive there time enough to admit of your giving the sloop companies the refreshment they may stand in need of, before you prosecute the farther object of these instructions. Upon your arrival at Otaheite, or the Society Isles, you are to land Omiah at such of them as he may choose, and to leave him there.

"You are to distribute among the chiefs of those islands such part of the presents with which you have been supplied, as you shall judge proper, reserving the remainder to distribute among the natives of the countries you may discover in the Northern Hemisphere: and having refreshed the people belonging to the sloops under your command, and taken on board such wood and water as they may respectively stand in need of, you are to leave those islands in the beginning of February, or sooner if you shall judge it necessary, and then proceed in as direct a course as you can to the coast of New Albion, endeavouring to fall in with it in the latitude of 45 deg. N. and taking care in your way thither, not to lose any time in search of new lands, or to stop at any you may fall in with, unless you find it necessary to recruit your wood and water.

"You are also in your way thither, strictly enjoined not to touch upon any part of the Spanish dominions on the

the western continent of America, unless driven thither by some unavoidable accident; in which case you are to stay no longer there than shall be absolutely necessary, and to be very careful not to give umbrage or offence to any of the inhabitants or subjects of his catholic Majesty. And if, in your farther progress to the northward, as hereafter directed, you find any subjects of any European prince or state upon any part of the coast you may think proper to visit, you are not to disturb them, or give them any just cause of offence, but, on the contrary, to treat them with civility and friendship.

"Upon your arrival on the coast of New Albion, you are to put into the first convenient port to recruit your wood and water, and procure refreshments, and then to proceed northward along the coast, as far as the latitude of 65 deg. or farther, if you are not obstructed by lands or ice; taking care not to lose any time in exploring rivers or inlets, or upon any other account, until you get into the before-mentioned latitude of 65 deg. where we could wish you to arrive in the month of June next. When you get that length, you are very carefully to search for, and to explore, such rivers, or inlets, as may appear to be of considerable extent, and pointing towards Hudson's, or Baffin's Bays, and if, from your own observations, or from any information you may receive from the natives (who, there is reason to believe are the same race of people, and speak the same language, of which you are furnished with a vocabulary, as the *Esquimaux*) there shall appear to be a certainty, or even a probability of a water passage into the aforementioned bays, or either of them, you are, in such case, to use your utmost endeavours to pass through with one or both of the sloops, unless you shall be of opinion that the passage may be effected with more certainty, or with greater probability by smaller vessels; in which case you are to set up the frames of one or both the small vessels with which you are provided, and, when they are put together, and are properly fitted, stored, and victualled, you are to dispatch one or both of them, under the care of proper officers, with a sufficient number of petty officers, men, and boats, in order to attempt the said passage; with such instructions for rejoining you, if they should fail, or for their farther proceedings, if they should succeed in the attempt, as you shall judge most proper. But, nevertheless, if you shall find it more eligible to pursue any other measures than those above pointed out, in order to make a discovery of the before-mentioned passage (if any such there be) you are at liberty; and we leave it to your discretion, to pursue such measures accordingly.

"But, should you be satisfied, that there is no passage through the bays, sufficient for the purposes of navigation, you are, at the proper season of the year, to repair to the port of St. Peter and St. Paul in Kamtschatka, or wherever else you shall judge more proper, in order to refresh your people and pass the winter; and in the spring of the ensuing year, 1778, to proceed from thence to the northward, as far as, in your prudence, you may think proper, in further search of a north-east, or north-west passage, from the Pacific Ocean into the Atlantic, or North Sea: and if, from your own observation, or any information you may receive, there shall appear to be a probability of such a passage, you are to proceed as above directed; and having discovered such a passage, or failed in the attempt, make the best of your way back to England, by such route as you may think best for the improvement of geography and navigation; repairing to Spithead with both sloops, where they are to remain till further orders.

"And at whatever places you may touch in the course of your voyage, where accurate observations of the nature hereafter mentioned have not already been made, you are, as far as your time will allow, very carefully to observe the situation of such places, both in latitude and longitude; the variation of the needle; bearings of head lands; height, direction, and course of the tides and currents; depths, and soundings of the sea; shoals, rocks, &c. and also to survey, make charts, and take

views of such bays, harbours, and different parts of the coast, and to make such notations thereon, as may be useful either to navigation or commerce. You are also carefully to observe the nature of the soil, and the produce thereof; the animals and fowls that inhabit or frequent it; the fishes that are to be found in the rivers or upon the coasts, and in what plenty; and, in case there are any peculiar to such places, to describe them minutely, and to make as accurate drawings of them as you can: and, if you find any metals, minerals, or valuable stones, or any extraneous fossils, you are to bring home specimens of each; as also of the seeds of such trees, shrubs, plants, fruits and grains, peculiar to those places, as you may be able to collect, and to transmit them to our Secretary, that proper experiments and examination may be made of them. You are likewise to examine the genius, temper, disposition, and number of the natives and inhabitants, where you find any; and to endeavour, by all proper means, to cultivate a friendship with them, making them presents of such trinkets as you may have on board, and they may like best; inviting them to traffic; and shewing them every kind of civility and regard; but taking care, nevertheless, not to suffer yourself to be surprized by them, but to be always on your guard against any accidents.

"You are also, with the consent of the natives, to take possession, in the name of the King of Great Britain, of convenient situations in such countries as you may discover, that have already not been discovered or visited by any other European power; and to distribute among the inhabitants such things as will remain as traces and testimonies of your having been there; but if you find the countries so discovered are uninhabited, you are to take possession of them for his Majesty, by setting up proper marks and inscriptions, as first discoverers and possessors.

"But forasmuch as, in undertakings of this nature, several emergencies may arise not to be foreseen, and therefore not particularly to be provided for by instructions before-hand; you are, in such cases, to proceed as you shall judge most advantageous to the service on which you are employed: and you are, by all opportunities, to send to our Secretary, for our information, accounts of your proceedings, and copies of the surveys and drawings you shall have made; and upon your arrival in England, you are immediately to repair to this office, in order to lay before us a full account of your proceedings in the whole course of your voyage; taking care before you leave the sloop, to demand from the officers and petty officers, the log-books and journals they may have kept, and to seal them up for our inspection; and enjoining them and the whole crew, not to divulge where they have been, until they have permission so to do: and you are to direct Captain Clerke to do the same, with respect to the officers, petty officers, and crew of the *Discovery*.

"Should any accident happen to the *Resolution*, in the course of the voyage, so as to disable her from proceeding any farther, you are, in such case, to remove yourself and her crew into the *Discovery*, and to prosecute your voyage in her; her commander being hereby strictly required to receive you on board, and to obey your orders, the same, in every respect, as when you were actually on board the *Resolution*: and, in case of your inability, by sickness or otherwise, to carry these instructions into execution, you are to be careful to leave them with the next officer in command, who is hereby required to execute them in the best manner he can.

"The above Instructions were given July the 6th, 1776, under the hands of the Earl of Sandwich, Lord C. Spencer, Sir H. Palliser; and, by command of their Lordships, signed Philip Stephens, Secretary of the Admiralty."

In order to carry this noble and extensive plan into execution, on February the 14th 1776, the *Resolution* and *Discovery*, having been completely equipped in the dock at Deptford, were put into commission. Captain Cook hoisted his pendant on board the former sloop; and the command of the *Discovery*, of three hundred

tons burthen, which had been purchased into the service, was given to captain Clerke, who had been captain Cook's second Lieutenant, on board the Resolution, in his second voyage round the world. Both ships were well fitted out, and supplied abundantly with every article necessary for a long voyage: and on the 8th of June, while they lay in long reach, we had the satisfaction of a visit from the earl of Sandwich, Sir Hugh Palliser, and others of the board of Admiralty, to examine whether every thing had been completed pursuant to their orders, and to the convenience of those who were to embark. They honoured captain Cook with their company to dinner on that day; and were saluted, on their coming on board, and on their going on shore, with seventeen guns and three cheers. To convey some permanent benefit to the inhabitants of Otaheite, and of the other islands which we might happen to visit, his Majesty ordered us a supply of some useful animals, and we took on board a bull, two cows, with their calves, and some sheep; with hay and corn for their support. We were also furnished with a sufficient quantity of our valuable European garden seeds, which might add fresh supplies of food to the vegetable productions of our newly discovered islands. We had also an extensive assortment of iron tools and trinkets, to facilitate a friendly commerce and intercourse with the inhabitants of such new countries as we might discover. With respect to our own wants, nothing was refused us that might be conducive to health, comfort or convenience. Those at the head of the naval department were equally solicitous to render our voyage of public utility; to this end we received a variety of astronomical and nautical instruments, which the Board of Longitude intrusted to captain Cook and Mr. King, his second Lieutenant; they having engaged to supply the place of a professed observer. The Board, likewise, put into their possession the time-keeper, which captain Cook had carried out in his last voyage, and which had performed so well. It was constructed by Mr. Kendal, and was a copy of Mr. Harrison's. Another time-piece, and the same assortment of astronomical and other instruments, were put on board the Discovery, for the use of Mr. William Bailey, who was engaged as an observer on board that sloop. Though several young men, among the sea officers, were capable of being employed in constructing charts, drawing plans, and taking views of the coasts, and head-lands, nevertheless, Mr. Webber was engaged to embark with captain Cook, for the purpose of supplying the defects of written accounts; by taking accurate and masterly drawings of the most memorable scenes of our transactions. Mr. Anderson, likewise, Surgeon to captain Cook, added to his professional abilities a great proficiency in natural history. He had already visited the South Sea islands in the same ship, and enabled the Captain to enrich his relation of his voyage with useful and valuable remarks. The vocabularies of the Friendly and Sandwich islands, and of the natives of Nootka had been furnished to our commander, by this his most useful associate, Mr. Anderson: and a fourth, in which the language of the Esquimaux is compared with that of the Americans on the opposite side of the continent, had been prepared by the Captain himself. The confessed abilities, and great assiduity of Mr. Anderson, in observing every thing that related either to natural history, or to manners and language, and the desire that captain Cook, on all occasions, shewed to have the assistance of that gentleman, stamped a great value on his collections.

The Resolution had the same appointment of officers and men which she had in her former voyage; and the establishment of the Discovery varied from that of the Adventure, in the single instance of her having no marine officer on board. This arrangement was to be finally completed at Plymouth; and on the 9th of July we received the party of marines allotted for our voyage. And the supernumerary seamen, occasioned by this reinforcement being turned over into the Ocean man of war, our several complements of officers, and the re-

spective crews of both ships, remained as expressed in the two underwritten lists.

I. A LIST of the OFFICERS, SEAMEN, and PRIVATES, on board the RESOLUTION.

1	CAPTAIN	- - -	James Cook,
3	LIEUTENANTS	- -	John Gore, James King, and John Williamson.
1	MASTER	- - -	William Bligh.
1	BOATSWAIN	- - -	William Ewin.
1	CARPENTER	- - -	James Clevely.
1	GUNNER	- - -	Robert Anderson.
1	SURGEON	- - -	William Anderson.
3	MASTER'S MATES	- -	Roberts, &c.
6	MIDSHIPMEN	- -	Hargest, &c.
2	SURGEON'S MATES	- -	Sainwell and Davis.
2	CAPTAIN'S CLERKS	- -	Alex. Hogg and Alex. Dewar.
1	MASTER at ARMS	- -	William Collet.
1	CORPORAL	- -	William Griffiths.
1	ARMOURER	- -	William Hunt.
1	DITO MATE	- -	William Price.
1	SAIL MAKER	- -	William Widdel.
1	DITO MATE	- -	William Maccril.
3	BOATSWAIN'S MATES	- -	Quin, James, and Doyle.
3	CARPENTER'S DITO	- -	Barber and Macintosh.
2	GUNNER'S DITO	- -	Brown and Ramsey.
4	CARPENTER'S CREW	- -	Carter, &c.
1	COOK	- - -	Robert Morris.
1	DITO MATE	- -	Richard Young.
6	QUARTER MASTERS	- -	Welington, &c.
45	ABLE SEAMEN.		

MARINES.

1	LIEUTENANT	- - -	Molesworth Philips.
1	SERJEANT	- - -	Samuel Gibson.
2	CORPORALS	- - -	Lediard and Thomas.
1	DRUMMER	- - -	Michael Portman.
15	PRIVATES.		

Total of the Ship's Company 113 men.

II. A LIST of the OFFICERS, SEAMEN, and PRIVATES, on Board the DISCOVERY.

1	CAPTAIN	- - -	Charles Clerke.
2	LIEUTENANTS	- - -	James Burney, John Rickman.
1	MASTER	- - -	Thomas Edgar.
1	BOATSWAIN	- - -	Eneas Atkins.
1	CARPENTER	- - -	Peter Reynolds.
1	GUNNER	- - -	William Peckover.
1	SURGEON	- - -	John Law.
2	MASTER'S MATES	- -	Home and Hollingby.
4	MIDSHIPMEN	- - -	Alex. Mouat, &c.
2	SURGEON'S MATES	- -	Snaggs and Ellis.
1	CAPTAIN'S CLERK	- -	Gregory Banthom.
1	MASTER at ARMS.		
1	CORPORAL		
1	ARMOURER	- - -	Dixon.
1	DITO MATE.		
1	SAIL MAKER.		
1	DITO MATE.		
2	BOATSWAIN'S MATES.		
2	CARPENTER'S DITO.		
1	GUNNER'S DITO.		
4	CARPENTER'S CREW.		
1	COOK.		
4	QUARTER MASTERS	- -	Cox, &c.
33	ABLE SEAMEN.		

MARINES.

1	SERJEANT	- - -	Lctant.
1	CORPORAL.		
1	DRUMMER	- - -	Hollywell.
8	PRIVATES.		

Total of the Ship's Company 80 men.

To these we may here add Omiah, who, as we were to touch at the Society islands and Otaheite, was to take his passage in the Resolution, to his native country. Before

Before the Resolution and Adventure quitted the small but fertile island of Huaheine, captain Furneaux, who had the command of the latter, agreed to receive on board his ship a young man named Omai, or Omiah, a native of Ulitea, where he was possessed of some property, of which he had been deprived by the people of Bolabola. Captain Cook wondered that captain Furneaux would encumber himself with this man, who in his opinion, was not a proper sample of the inhabitants of those happy islands, not having any advantage of birth, or acquired rank, nor being eminent in shape, figure, or complexion; for their people of the first rank are much fairer, and, usually, better behaved, and more intelligent, than the middling class of people, among whom Omiah is to be ranked. Captain Cook, however, since his arrival in England, has been convinced of his error; for, excepting his complexion (which is undoubtedly of a deeper hue than that of the Earses, or gentry, who live, as in other countries, a more luxurious life, and are less exposed to the heat of the sun) he doubted whether any other of the natives would have given a more general satisfaction by his behaviour among them. "Omiah, he observed, has certainly a very good understanding, quick parts, and honest principles; he has a natural good behaviour, which renders him acceptable to the best company, and a proper degree of pride, which taught him to avoid the society of persons of inferior rank. He has passions of the same kind as other young men, but has judgment enough not to indulge them in any improper manner. I do not imagine that he has any dislike to liquor, and if he had fallen into company where the person who drank the most, met with the most approbation, I have no doubt, but that he would have endeavoured to gain the applause of those with whom he associated; but, fortunately for him, he perceived that drinking was very little in use but among the inferior people, and as he was very watchful into the manners and conduct of the persons of rank who honoured him with their protection, he was sober and modest; and I never heard that, during the whole time of his stay in England, which was two years, he ever once was disguised with wine, or ever shewed an inclination to go beyond the strictest rules of moderation. Soon after his arrival in London, the Earl of Sandwich, the first Lord of the Admiralty, introduced him to his Majesty at Kew, when he met with a most gracious reception, and imbibed the strongest impression of duty and gratitude, which I am persuaded he will preserve to the latest moment of his life. During his stay in England he was caressed by many of the principal nobility, and did nothing to forfeit the esteem of any one of them; but his principal patrons were the earl of Sandwich, Mr. Banks, and Dr. Solander: the first probably thought it a duty of his office to protect and countenance an inhabitant of that hospitable country, where the wants and distresses of those in his department had been alleviated and supplied in the most ample manner; the others, as a testimony of their gratitude for the generous reception they had met with during their residence in his country. But though Omiah lived in the midst of amusements during his residence in England, his return to his native country was always in his thoughts; and though he was not impatient to go, now the time of his return approached, he was agitated by different passions in turns, and left London with a mixture of regret and satisfaction." In our voyage, when we talked about England, and about those, who, during his stay, had honoured him with their protection and friendship, his spirits were sensibly affected, and it was with difficulty he could refrain from tears. But, the instant the conversation turned to his own islands, his eyes began to sparkle with joy. He was deeply impressed with a sense of the good treatment he had met with in England, and entertained the highest ideas of the country and of the people. But the pleasing prospect he now had of returning home, loaded with what he well knew would be esteemed invaluable treasures there, and the flattering hope which the possession of these gave him, of attaining to a distinguished superiority among his countrymen, were considerations that

operated by degrees, to suppress every uneasy sensation; and he seemed to be quite happy when he got on board the ship. By his Majesty, he was supplied with an ample provision of every article which, during our intercourse with his country, we had observed to be in any estimation there, either as useful or ornamental. He had, besides, received many presents of the same nature from Lord Sandwich, Mr. Banks (now Sir Joseph) and several other gentlemen and ladies of his acquaintance. In short, every method had been employed, both during his abode in England, and at his departure, to make him the instrument of conveying to the inhabitants of the Society Islands, and others in the Pacific Ocean, the most exalted opinion of British greatness and generosity.

Every preparation being now completed, Captain Cook received an order to proceed to Plymouth, and to take the Discovery under his command; in consequence of which, having taken in our guns at the Galleons, on the 15th of June 1766, both ships came to an anchor at the Nore; but our fresh provisions being nearly exhausted, the Discovery weighed next day, in obedience to Captain Cook's order, but the Resolution remained at the Nore waiting for her Commander, who was then in London. On the 24th, every thing being ready for our departure, Captain Cook set out with Omiah from London, at six o'clock in the morning; by eleven they reached Chatham, and after dining with Commissioner Proby, he very obligingly ordered his yacht to convey them to Sheerness, where the Captain's boat was waiting to take them on board. On the 25th, we made sail for the Downs; and came to an anchor there on Wednesday the 26th. Having received our boats on the day following, we got again under sail; and on Sunday the 30th, at three o'clock, P. M. we anchored in Plymouth-sound, where the Discovery had arrived only three days before. We saluted Admiral Amherst, whose flag was flying on board the Ocean, and he returned the compliment. On the 1st and 2d of July we were employed in replacing the water and provisions we had expended, and in receiving on board a supply of Port wine. On Saturday the 6th, his majesty's ships Diamond, Arabuscade, and Unicorn, with a fleet of transports, consisting of 62 sail, bound to America, with the last division of the Hessian troops, and some horse, were forced into the sound. On the 8th, Captain Cook received his instructions, and on the 10th the proper persons came on board and paid the officers and crew up to the 30th of last month. The petty officers and seamen received also two months wages in advance. Such indulgence to the latter is customary, but the payment of what was due to the superior officers, was in consideration of our peculiar situation, to enable us to defray the expence of furnishing ourselves with necessaries for a voyage of such uncommon duration.

As to Omiah, he appeared to be quite happy on board, nor would he go on shore, though numbers of people were frequently waiting there with the expectation of seeing him. To the account already given of this child of curiosity, we shall add some traits of his character as delineated by Mr. Forster, wherein his good qualities are so blended with childishness and folly, that one can hardly think it applicable to the same person. "Omiah," says Mr. Forster, "has been considered either as remarkably stupid or very intelligent, according to the different allowances which were made by those who judged of his abilities. His language which is destitute of every harsh consonant, and where every word ends with a vowel, had so little exercised his organs of speech, that they were wholly unfit to pronounce the more complicated English sounds; and this physical, or rather habitual defect, has been too often misconstrued. Upon his arrival in England, he was immediately introduced into general company, led to the most splendid entertainments, and presented at court amidst a brilliant circle of the first nobility. He naturally imitated that easy and elegant politeness which is so prevalent in all those places: he adopted the manners, the occupations, and amusements of his com-

panions, and gave many proofs of a quick conception and lively fancy. Among the instances of his intelligence, I need only mention his knowledge of the game of chess, in which he has made an amazing proficiency. The multiplicity of objects that crowded upon him, prevented his paying due attention to those particulars, which would have been beneficial to himself and his countrymen at his return. He was not able to form a general comprehensive view of our whole civilized system, and to abstract from thence what appeared most strikingly useful, and applicable to the improvement of his country. His senses were charmed by beauty, symmetry, harmony, and magnificence; they called aloud for gratification, and he was accustomed to obey their voice. The continued round of enjoyments left him no time to think of his future life; and being destitute of the genius of a Tupia, whose superior abilities would have enabled him to form a plan for his own conduct, his understanding remained unimproved. After having spent two years in England, his judgment was in its infant state; and, therefore, when he was preparing to return, he coveted almost every thing he saw, and particularly that which amused him by some unexpected effect. To gratify his puerile fancy, as it should seem, rather than from any other motives, he was indulged with a portable organ, an electrical machine, a coat of mail, and a suit of armour." Such is

the account. and such the character of Omiah, (as given by Mr. Forster,) who left his country, and his connections, to roam he did not know where, nor for what, having no idea of improving the arts, manufactures, or commerce of his country, or introducing one useful science among them. He carried with him, besides the articles above enumerated, a profusion of almost every thing that can be named, axes, saws, chisels, and carpenters tools of every kind; all sorts of Birmingham and Sheffield wares; guns, pistols, cutlasses, powder, and ammunition; needles, pins, fish-hooks, and various implements for sport; nets of all sorts; with hand-engines, and a lathe for turning. He had likewise cloaths of different colours and different fabrics, laced and plain; some made in the style of his own country, and several after our manner. Some of these last he bartered with the petty officers (after he had passed New Zealand) for red feathers. He was likewise supplied plentifully with glass and china-ware, with beads and toys, some of great value; medals of various metals; and a watch was presented to him by a person of distinction: in short, nothing was withheld from him that he required either for trade in his own country, or for curiosity. How he behaved on board, and in what manner he was received on his return home, will be seen in the sequel of the history of our voyage, to which we now proceed.

Departure of the Resolution from Plymouth Sound—Her passage to Teneriffe, and reception she met with there—The road of Santa Cruz described—Geographical account of the island, and history of the cities of Santa Cruz and Laguna—Air, climate, agriculture, produce, commerce, and inhabitants described—Her departure from Teneriffe for the Cape of Good Hope—The Discovery follows, and joins company some time after her arrival there—The Resolution in danger near the sunken rocks of Bonavista—Arrives at the Cape of Good Hope—Transactions there—An account of Mr. Anderson's journey up the country—Both ships leave the Cape, and proceed on their voyage to the southward.

A. D. 1776. **I**N the morning of the 11th of July, Captain Cook delivered into the hands of Mr. Burney, first lieutenant of the Discovery, Captain Clerk's sailing orders; a copy of which he also left with the commanding officer of his majesty's ships at Plymouth, to be delivered to the Captain on his arrival.

In the afternoon we weighed with the ebb, and got out beyond all the shipping in the sound. On Friday the 12th, the impatience of the ship's company, and the notion they had entertained of its being a lucky-day, as it was the same the Resolution had set sail on in her former voyage, induced Captain Cook to comply with their importunities. Accordingly, at eight o'clock, P. M. we stood out of the sound, with Omiah on board, having a gentle breeze at N. W. by W. Captain Clerk was ordered to follow us with the Discovery, to St. Jago, one of the Cape de Verd Islands, and if he should there miss of us to pursue his course directly for the Cape of Good Hope. Soon after we came out of the sound, the wind came more westerly, and blew fresh, which obliged us to ply down the channel; and we were not off the Lizard till Sunday the 14th, in the evening. On Tuesday the 16th, we observed in latitude 49 deg. 53 min. 30 sec. N. St. Agnes's Light-house bearing at this time N. W. by W. distant about eight miles, and, by our reckoning, situated in 49 deg. 57 min. 30 sec. N. and in 6 deg. 20 min. W. longitude. Our readers will be pleased here to observe, that, in this voyage, we reckon our longitude from the meridian of Greenwich, and after passing to the east in the South Atlantic, it is carried on easterly beyond the Great Meridian, or 180th degree, to the utmost extent of the voyage, and back again to the same meridian. On the 17th our commander began his judicious operations for preserving the health of his crew; for this day the spare sails were well aired, and the ship was smoked between decks with gunpowder. On Thursday the 18th, we were abreast of Ushant, and, by

the watch, found the longitude of the island to be 5 deg. 18 min. 37 sec. W. On the 19th, we stood westward till eight o'clock, A. M. when the wind shifted; upon which we tacked and stretched to the southward. Soon after we came in sight of nine sail of large ships, which we supposed to be French men of war. On Monday the 22nd, we observed in latitude 44 deg. 6 min. N. longitude 8 deg. 23 min. W. when Cape Ortegal, then in view, bore S. E. half S. distant four leagues. We had calm weather till the afternoon of the 24th, when we passed Cape Finisterre, with a fine gale at N. N. E. By the watch, and the mean of 41 lunar observations, we found the longitude of this cape to be 9 deg. 19 min. 12 sec. On Tuesday the 30th, finding we wanted a supply of hay and corn, for the subsistence of our live stock of animals on board, Captain Cook determined to touch at Teneriffe, in order to procure those necessaries, as well as the usual refreshments for ourselves. On the 31st, at four o'clock P. M. we saw Teneriffe, made for the eastern part of it, and during the night stood off and on.

Thursday the 1st of August, early in the morning, we proceeded round the east point of the island, to the S. E. side, and, about eight o'clock, anchored in the road of Santa Cruz, in 23 fathoms water. We moored N. E. and S. W. near half a mile from the shore; in which position Punta de Nago bore N. 64 deg. E. The church of St. Francis, which has a remarkable high steeple, W. S. W. the Pic, S. 65 deg. W. and the S. W. point of the road, on which stands a castle, S. 39 deg. W. In this road were riding one French frigate, two French brigantines, an English one, and 14 sail of the Spanish nation. We had no sooner anchored than we received a visit from the master of the port, who only asked the ship's name; and upon his retiring, Captain Cook sent an officer ashore, to request his permission, that we might take in water, and purchase other necessary articles. This he politely granted.

ed, and sent one of his officers on board to compliment the captain on his arrival; who, in the afternoon, waited upon the governor in person, accompanied by some of his officers; and, before he returned, bespoke some corn and straw, ordered a quantity of wine, and made an agreement for a supply of water, with a Spanish boat.

The principal road of Teneriffe is this of Santa Cruz, on account of its capacity, and the goodness of its bottom. It lies before the town of the same name. Great care is observed in mooring ships, as the road lies entirely open to the S. E. and S. winds. We observed, that all those vessels which lay here at this time, had four anchors out, and their cables were buoyed up with casks. By not attending to this last particular, we found ours had suffered a little. The water to supply the shipping, and for the use of the inhabitants of Santa Cruz is derived from a rivulet that runs from the hills, which is conveyed into the town in wooden troughs. As these troughs were at this time repairing, fresh water was extremely scarce. For the convenience of loading and landing goods, at the S. W. part of the road, a stone pier is run out from the town into the sea. It might be naturally concluded, from the appearance of the country about Santa Cruz, that Teneriffe is a barren spot: but the following account of this island will prove the contrary: and for the entertainment of the curious part of our readers, we shall present them with a relation of a journey up the Pike of Teneriffe, including a brief account of the weather and produce of the island.

The island of Teneriffe was antiently called Nivaria, from the snow that incloses the neck of the Pike of Teyda, like a collar; the name of Teneriffe, or the White Mountain, being given it by the natives of Palma, in whose language *Tener* signifies snow, and *iffe*, white; the summit of the Pike of Teneriffe being always covered with snow. Point Nago, or Anaga, which is the N. E. point of Teneriffe, bears N. W. about 16 leagues distant from the N. W. part of Canaria; but from that part of Canaria to the nearest part of Teneriffe, the distance does not exceed 12 leagues.

This island is nearly triangular, the three sides being almost equal, and each about 36 miles long. In the center is the famous Pike of Teneriffe, said to be the highest mountain in the universe, and strikes the spectators with amazement, both near and at a distance. This great mountain extends its base to Garrachino, from whence it is two days and a half's journey to the top; but we shall speak more particularly of this in the sequel. In coming in with Teneriffe, in clear weather, the Pike may be easily discerned at 120 miles, or 40 leagues distance; and in sailing from it, at the distance of 150 miles, or 50 leagues, when it resembles a thin blue vapour, or smoke, very little darker than the sky. Before we lose sight of this towering mountain, it seems a considerable height above the firmament, though from its distance, and the spherical figure of the earth, the rest of the island is sunk beneath the horizon, notwithstanding its being exceedingly high. There are several high perpendicular rocks near Punto de Nago; and on the south-east side of the island, is the harbour of Santa Cruz, the most frequented part in the Canary islands. The best road for ships is about a mile to the northward: between the middle of the town and fort, or castle, ships may lie secure from all winds, though the bay is exposed to those which blow from the N. E. coasts and S. E. yet these winds do not blow so hard as to cause any considerable damage above once in the space of four or five years. However, we learn from Glafs, that some years ago, most of the shipping in the road were driven on shore by one of these gales. Some English ships were then in the harbour; but the crews prudently cutting away their masts, rode out the storm. In the middle of the town, for the convenience of landing, is a mole, built at vast expence. It runs up to the northward, and the outermost part turns towards the shore. However, in mild weather, goods are landed at a creek among the rocks, at the distance of a stone's cast

to the southward of the mole, and near the custom-house. In the way from the mole into the town, there is a square fort on the left hand, named St. Philip's; this is the principal one in the bay. To the northward of it are some forts and batteries mounted with guns, the most considerable of which is named *Passo Alto*. Near it is a steep rocky valley, which begins at the sea shore, and runs a great way within land. There are several batteries at the south end of the town, and beyond them, close to the shore, is a fort called St. Juan. All these forts are mounted with cannon, and joined together by a thick stone wall, which begins near the above rocky valley, and continues with little interruption, to fort St. Juan. This wall is within only breast high, but it is higher on the outside facing the sea, and from thence to the southward; the shore being naturally fenced with rocks, is generally inaccessible.

Santa Cruz is a large town, and contains several churches, three convents of friars, an hospital, and the best constructed private buildings of any to be found in the Canary islands. It is indeed the capital of them all, for though the episcopal see and courts of judicature are in the city of Palmas, in Canaria, the governor-general of the islands always resides in Santa Cruz, where a great concourse of foreigners continually resort, on account of its being the center of the trade between the Canary islands with Europe and America. The number of inhabitants are supposed to amount to about five or six thousand. The water drank by them is conveyed into the town in open wooden troughs, from a spring beyond the above-mentioned valley, and there are pits of water, which serve for other purposes, in many houses. Near 12 miles to the southward of Santa Cruz, and close to the sea, there is a cave, with a church, or chapel, called our Lady of Candelaria, in which is a little image of the Virgin Mary, about three feet high, holding a green candle in one hand, and in the other an infant Jesus, who has a gilt bird in each hand. This chapel received its name of Candelaria, from its being pretended, that on the eve of the purification of the Holy Virgin, a great number of lights are constantly seen going in procession round the cave, in which the image is placed: and they assert, that in the morning drops of wax are scattered about the sea shore. This image is held in the highest veneration, on account of the many miracles it is said to have performed, and her chapel is adorned with so many ornaments, that it is the richest place in all the seven islands. At a certain season of the year, most of the inhabitants of the island go thither in pilgrimage, when troops of young girls march singing, in an agreeable manner, the praises of the Virgin, and the miraculous deeds the image is said to have performed.

North-westward of the island is the bay of Adexe, or, as it is pronounced, Adehe, where large ships may anchor. On the N. W. side is a haven called Garrachica, once the best port in the island; but it was destroyed, in 1704, which the natives call the year of the earthquakes, and filled up by the rivers of burning lava that flowed into it from a volcano; so that houses are now built where ships formerly lay at anchor; yet vessels come there in the summer season. The earthquake began on the 24th of December; and in the space of three hours 29 shocks were felt. After this they became so violent as to cause all the houses to shake, and oblige the inhabitants to abandon them. The consternation became universal, and the people, with the bishop at their head, made processions and public prayers in the open fields. On the 31st a great light was observed on Manja, towards the White Mountains, where the earth opening, two volcanoes were formed, that threw up such heaps of stones, as to raise two considerable mountains; and the combustible matter continually thrown up, kindled in the neighbourhood above 50 fires. Things remained in this situation till the 5th of January, and then the sun was totally obscured with clouds of smoke and flame, which continually increasing, augmented the consternation and terror of the inhabitants. Before night, the whole country, for nine miles round, was in flames by the flowing of the liquid fire,

fire, with the rapidity of the torrent, into all quarters, from another volcano, which had opened by at least thirty different vents within the compass of half a mile. The horror of this scene was greatly increased by the violence of the shocks, which never once intermitted, but by their force entirely overthrew several houses, and shook others to their very foundations: while the wretched inhabitants were again driven defenceless and dismayed into the open fields, where they every moment expected to be swallowed up by some new gulf. The noise of the volcano was heard at sea at 20 leagues distance, where the sea shook with such violence as alarmed the mariners, who at first thought the ship had struck upon the rock. Mean while a torrent of sulphur, and melted ores of different kinds, rushed from this last volcano towards Guimar, where the houses and public buildings were thrown down by the violence of the accompanying shocks. On the 2nd of February another volcano broke out even in the town of Guimar, which swallowed up a large church. Thus from the 24th of December to the 23d of February, the people were constantly alarmed by continual shocks of earthquakes, and the terrible volcanoes that burst forth in different parts.

The town of Garrachica, is still pretty large, and contains several churches, and convents of both sexes. It has a small trade for brandy and wine, which are usually sent from thence in barks, or large open boats, to Santa Cruz, or Port Orotava. Strong and durable ships are also built there, some of which are upwards of three hundred tons burthen. Six miles to the eastward of this place stands the town of Port Orotava, which is a good harbour in the summer season, but in the winter, ships are often obliged to slip their cables and put to sea, for fear of being surprized with a N. W. wind, which throws in a heavy sea upon this coast. This is a place of considerable trade, it having flourished greatly since the destruction of the harbour of Garrachica. It contains two churches, two convents of friars, two of nuns, and some good private buildings. At each end of the town is a black sandy bay; and along the northernmost a low stone wall, built to prevent the landing of an enemy: at the other bay is a small castle, or fort, for the same purpose, and at the landing place between them is a battery of a few cannon: but the surf that continually breaks upon the shore is the best defence of this port. About three miles from hence within land is la Villa de Orotava, which is a large town, and contains several churches, and convents, with a number of stately stone buildings belonging to private persons. A rivulet which runs through the midst of it, refreshes their gardens and orchards, and supplies the inhabitants with water.

The city of St. Christobal de la Lagona, that is, St. Christopher of the lake, extends four miles within land from Santa Cruz. The road to it from the above town is a pretty steep ascent, till within a small distance of the city, which is seated in the corner of a plain, about four miles in length, and a mile in breadth. This city is the capital of the island, and contains two parish churches, three convents of friars, two of nuns, and three hospitals; two of which are for the venereal disease, and the other for foundlings. The jesuits have also a house here, and, besides these public structures, there are many handsome private buildings. The water drank by the inhabitants is conveyed in troughs to the city, from the mountains situated to the southward of the plain. In this city there is not the least shew of business, it being chiefly inhabited by the gentry of the island, particularly the officers of justice, with the judge of the Indies, who presides in the India-House, where all affairs relating to the West-India commerce are conducted. Here is likewise an office of inquisition subject to the tribunal of the holy office of Grand Canaria; yet the city appears to a stranger as if desolate and uninhabited; for seldom any one can be seen in the streets, and grass grows in the most frequented places. There is a lagoon, or lake, behind the city, about half a mile in circumference, from which the city takes its name. It is dry in summer, but in winter is full of stagnant water.

As this city is situated on a plain, elevated a considerable height above the sea, it is extremely cold in winter, and in all seasons exposed to the wind. The road descends, from the western extremity of this plain, to La Montanza de Centejo, a large village in the midway between Santa Cruz and Port Orotava, chiefly inhabited by peasants and labouring people. Some of the towns are situated at no great distance from the sea, from whence most of them may be seen; and, indeed, there are no habitations at a greater distance from each other than nine miles. A large town, called Realajo, is situated in the western border, and La Rambla on the eastern. The towns of Orotava, and Port Orotava, stood between them, with a number of detached inhabitants, scattered about from the sea shore upwards to the clouds, in, or beyond which, there are no houses; yet the clouds are not higher than the middle distance between the sea and the summit of the pike.

The whole island continues to rise on all sides from the sea till it terminates in the pike, which, as we have observed, is in the center. The north side is the most fertile, and ascends more gradually than the other, particularly a space along the shore about three leagues broad, bounded on the sides by high mountains or rather cliffs; but it rises upwards from the sea, like a hanging garden, till you come within 3 miles of the clouds, without any considerable intervention of hills and valleys. All the fertile ground, within a league of the sea, is covered with vines; corn grows in the next league; and in the third, some corn, woods of chestnuts, and many other different sorts of trees. Above these woods are the clouds, which, in fine weather, generally descend gradually towards the evening, and rest upon these woods till the morning, when they reascend about a league, and there remain till the succeeding evening. There are several other towns, and many small villages besides the towns already mentioned. This island is so populous, that, when the last account was taken, it contained no less than 96,000 persons, and is supposed to contain as many souls as all the rest of the inhabited islands.

The city of Laguna, which stands near a lake, about nine miles from the sea, is the principal place in Teneriffe: it is called by the Spaniards St. Christoval de la Laguna, and is handsomely built, having two parish churches, and a palace for the governor, who resides here. The aldermen of this city pay a price to the king to serve their offices of magistrates; but this gives them great power over the inhabitants, who are divided into three classes, namely, gentlemen, merchants, and husbandmen, or as they are termed by the natives, idle men, busy men, and labouring men. The land on each side of the road, leading to Laguna, is, in general, rocky, but some spots of corn-land are interpered here and there, and terminated by small vineyards on the sides of the mountains. This city presents the beholder with an agreeable prospect, as it stands on the side of a hill, and stretches its skirts on the plain behind: it is large, compact, and populous: the houses, though not uniform, have a pleasant appearance; besides the governor's house, and the two parish churches, here are two nunneries, four convents, an hospital, and some chapels, besides many gentlemen's houses. The convents are those of St. Francis, St. Augustine, St. Dominic, and St. Diego. The churches have pretty high square steeples, which top the rest of the buildings. The streets are not regular, yet they are for the most part spacious, and near the middle of the town is a large parade, which has good buildings about it. There is a strong prison on one side of it, near which is a large conduit of good water that supplies all the town. The inhabitants have many gardens that are set round with orange, lime, and other fruit trees, in the middle of which are flowers, fallading, &c. and indeed, if the people were curious this way, they might have very pleasant gardens: for the town stands high from the sea, on the brow of a plain that is all open to the east, and has consequently the benefit of the trade wind, which blows here, and is commonly fair; so that there are seldom wanting, at this town, all the day, brisk, cooling,

cooling, refreshing breezes. There is a large plain on the back of the town, three or four leagues in length, and two miles broad, producing a thick, kindly grass. On the east side is a lake of fresh water; but, being stagnant, it is only used for cattle: it is about half a mile in circumference.

The ancient inhabitants of Teneriffe were called Guanches, but their origin is not certainly known: they were, and the remainder of them still are without literature; but their language, which still remains among the remnant of them, bears some affinity to that of the Moors in Barbary; it was formerly very guttural, and entirely different from that used in the other islands. They were of good stature, well made, and had tolerable complexions, but those who dwelt on the north side of the island were much fairer, and had lighter hair than those in the South. These people had some notion of a deity, and held, that there is a supreme power, which they distinguished by the names of Ach-guaregenan, Achoran, and Achaman, which signify the sustainer of the heavens and the earth. They also gave the titles of the great, the sublime, the maintainer of all: but they did not worship idols, nor had any images of the deity. They believed that God created them of earth and water, and made as many men as women, giving them cattle, and every thing necessary for their subsistence; but that afterwards there appearing to him too few, he created more; but to these last gave nothing; and when they prayed to him for flocks of sheep, and herds of goats, he bid them go and serve the others, who, in return, would give them food. From these, they said, were descended their servants. They had some idea of the immortality of the soul, by supposing the existence of places for future rewards and punishments. In particular, they supposed the Pike of Teneriffe to contain hell in its bowels, which they termed Echeyda; and gave the name of Guayotta to the devil.

In Teneriffe, the weather is the same as in Grand Canaria; but the sea-breeze generally sets in at about ten o'clock in the morning, on the E. and N. E. sides of the island, and blows till about five or six in the evening, when it falls calm till midnight. The land wind then begins, and continues till seven or eight in the morning, when it is followed by a calm, which lasts till the sea breeze returns. In the bay of Santa Cruz, and on all the E. side of the island, the sea breeze commonly blows at E. and the land wind at W. On the N. side, the sea breeze blows at N. E. by E. or N. E. and the land wind directly opposite to it; but there is no land wind at Point Nago, where the land stretches towards the N. E. far into the sea. At the brow of the hill above Santa Cruz, and at the city of Laguna, a fresh gale blows from the N. W. all the time of the sea breeze, which is occasioned by the mountains almost encompassing the plain. These being so exceedingly high on the S. side of it, as to beat back the sea breeze, and throw it against the mountains that bound the N. side of the plain, where finding no passage, it veers to the S. E. and there meeting with no resistance, forces its way with great vehemence through the plain; till coming to the brow of the above mentioned hill, part of the current of air pours down it towards Santa Cruz, advancing within a mile and a half of the sea, where the true sea breeze checks it: yet there is no regular sea or land breeze, on the S. W. coast, which is sheltered from the trade or north-easterly wind by the immense height of the pike, which towers above the region of the wind: hence on that side of the island, there is either an eddy wind at S. W. or a calm.

This island produces nearly the same vegetables as that of Canaria, only there are more vine-yards, and less corn-land. The wines are strong, good, and very fit for exportation, especially into hot climates, by which they are generally greatly improved. Formerly a large quantity of Canary sack was made here, which the French call Vin de Malvesie, and we, corruptly, after them, name Malmsey, from Malvesia, a town in the Morea, famous for such luscious wine. In the last century, and still later, much of this was imported into

England; but of late years they have not made above fifty pipes in a season; for they now usually gather the grapes when green, and make a hard dry wine of them, which when about two or three years old, can hardly be distinguished from Madeira; but after four years of age it becomes so sweet and mellow as to resemble the wine of Malaga in Spain. This, like all the other Canary islands, affords orchilla weed in great plenty. The dragon tree, aloe, and pine, are natives of Teneriffe. The apricot, peach, and pear-trees, bear twice annually. The pregnada, lemon, and lignar wood, are found here, as are the cotton-shrub and colocintida. The rose blows at Christmas: the carnations are large and fine, but tulips will not thrive. The rocks abound with samphire, the meadows are covered with clover, and the beach produces a broad leaved grass. About fourscore ears of wheat spring from one root, the grains of which are as transparent as the purest yellow amber; and in a good season one bushel will produce a hundred fold: the barley and maize are not inferior to the wheat.

With respect to the animals, here are plenty of rabbits, hogs, wild goats, &c. Quails and partridges are larger than those in England, and extremely handsome. Wood-pigeons, turtles, and crows, abound in the spring. Several sorts of wild fowls resort hither in the winter season, affording plenty of game to the inhabitants of Laguna. The falcons, or rather strong large hawks, which hover over the lake of Laguna, are thus described by a gentleman who lately travelled to these islands: "I cannot forbear mentioning the haggard falcons that soar every evening about this lake. It is very good diversion to see the negroes fight them with slings; for they often swoop, several at a time; and besides, they are the best mettled hawks in the world, being of a larger kind than the Barbary falcon. The viceroy being one evening to see the sport, on the author's commending their strength and mettle, assured him upon his honour, that a falcon bred in that island, which he had formerly sent to the duke of Larma, did at one flight, (unless she rested on any ship by the way) pass from Andalusia to Teneriffe, which is two hundred and fifty Spanish leagues, and was taken up half dead, having on the vessels and bells belonging to the duke."

In this island fishes are found in great quantities, particularly dolphins, sharks, meros, lobsters, mussels, periwinkles, the calcas, (which is deemed the best shell-fish in the universe) and the cherna, that exceeds in relish any we have in England: here is also another fish which is called an eel, though with little propriety, for it has seven tails of a span long joined to one body and one head, which are nearly of the same length. Silk worms thrive exceedingly; and bees prosper in the rocks and mountains. To this account we shall add the following remarks of the ingenious Mr. Anderson, (one of our ship's company, and of whom we have already made mention) on the natural appearances of Teneriffe, and its productions; as what he observed himself, or learnt by information, about the general state of the island, may be of use; seeing our readers may hereby be enabled to mark some changes that have happened there since the publication of the above geographical observations, which are chiefly extracted from Mr. MILLAR's deservedly much admired NEW and UNIVERSAL SYSTEM of GEOGRAPHY. The following are Mr. Anderson's own words, and narration.

"While we were standing in for the land, the weather being perfectly clear, we had an opportunity of seeing the celebrated Pike of Teneriffe: but I own, I was much disappointed in my expectation with respect to its appearance. It is, certainly, far from equalling the noble figure of Pico, one of the western isles which I have seen; though its perpendicular height may be greater. This circumstance, perhaps, arises from its being surrounded by other very high hills; whereas Pico stands without a rival.

"Behind the city of Santa Cruz, the country rises gradually, and is of a moderate height. Beyond this, to the south westward, it becomes higher, and continues to rise toward the Pic, which, from the road, appears

but little higher than the surrounding hills. From thence it seems to decrease, though not suddenly, as far as the eye can reach. From a supposition that we should not stay above one day, I was obliged to contract my excursions; otherwise I had proposed to visit the top of this famous mountain. To the eastward of Santa Cruz, the island appears perfectly barren. Ridges of hills run towards the sea; between which ridges are deep valleys, terminating at mountains or hills that run across, and are higher than the former. Those that run towards the sea, are marked by impressions on their sides, which makes them appear as a succession of conic hills, with their tops very rugged. The higher ones that run across are more uniform in their appearance.

"In the forenoon of the first of August, after we had anchored in the road, I went on shore to one of these valleys, with an intention to reach the top of the remotest hills, which seemed covered with woods; but time would not allow me to get farther than their foot. After walking about three miles, I found no alteration in the appearance of the lower hills; which produce great quantities of the *Euphorbia Canariensis*. It is surprising that this large succulent plant should thrive on so burnt up a soil. When broken, which is easily done, the quantity of juice is very great; and it might be supposed that, when dried, it would shrivel to nothing: yet it is a pretty tough, though soft and light wood. The people here believe its juice to be so caustic, as to corrode the skin; but I convinced them, though with much difficulty, to the contrary, by thrusting my finger in a plant full of it, without afterwards wiping it off. They break down the bushes of the *Euphorbia*, and suffering them to dry, carry them home for fuel. I met with nothing else growing there, but two or three small shrubs, and a few fig-trees near the bottom of the valley. The basis of the hills is a heavy compact blueish stone, mixed with some shining particles; and, on the surface, large masses of red friable earth, or stone, are scattered about. I also found the same substance disposed in a thick strata; and the little earth strewn here and there, was a blackish mould. There were also some pieces of slag; one of which, from its weight and smooth surface, seemed almost wholly metalline. The mouldering state of these hills is, doubtless, owing to the perpetual action of the sun, which calcines their surface. This mouldered part being afterwards washed away by the heavy rains, perhaps is the cause of their sides being so uneven. For, as the different substances of which they are composed, are more or less easily affected by the sun's heat, they will be carried away in the like proportions. Hence, perhaps, the tops of the hills, being of the hardest rock, have stood, while the other parts on a declivity have been destroyed. As I have usually observed, that the tops of most mountains that are covered with trees have a more uniform appearance, I am inclined to believe, that this is owing to their being shaded.

"The city of Santa Cruz, though not large, is tolerably well built. The churches are not magnificent without; but within are decent, and indifferently ornamented. They are inferior to some of the churches at Madeira: but, I imagine, this rather arises from the different disposition of the people, than from their inability to support them better: for the private houses, and dress of the Spanish inhabitants of Santa Cruz, are far preferable to those of the Portuguese at Madeira, who, perhaps, are willing to strip themselves, that they may adorn their churches.

"Almost facing the stone pier, at the landing-place, is a handsome marble column, lately put up, ornamented with some human figures, that do no discredit to the artist, with an inscription in Spanish, and the date, to commemorate the occasion of the erection.

"Friday the 2nd, in the afternoon, four of us hired mules to ride to the city of Laguna, so called from an adjoining lake; about four miles from Santa Cruz. We arrived there about six in the evening, but found a sight of it very unable to compensate for our trouble, as the road was very bad, and the mules but indifferent. The place is, indeed, pretty extensive, but

scarcely deserves to be dignified with the name of city.

"The disposition of its streets is very irregular; yet some of them are of a tolerable breadth, and have some good houses. In general, however, Laguna is inferior in appearance to Santa Cruz, though the latter, if compared with the former, is but small. The road leading from Santa Cruz to Laguna runs up a steep hill, which is very barren; but lower down, we saw some fig-trees, and several corn-fields. These last are but small, and not thrown into ridges, as is practiced in England. Nor does it appear that they can raise any corn here without great labour, as the ground is so encumbered with stones, that they are obliged to collect and lay them in broad rows, or walls, at small distances. The large hills that run to the S. W. appeared to be pretty well furnished with trees. Nothing else worthy of notice presented itself during this excursion, except a few aloe plants in flower, near the side of the road, and the cheerfulness of our guides, who amused us with songs by the way. Most of the laborious work in this island is performed by mules, horses being to appearance scarce, and chiefly reserved for the use of the officers. They are of a small size, but well shaped and spirited. Oxen are also employed to drag their casks along upon a clumsy piece of wood; and they are yoked by the head, though it doth not seem, that this has any peculiar advantage over our method of fixing the harness on the shoulders. In my walks and excursions I saw some hawks, parrots, the tern or sea-swallow, sea-gulls, partridges, wagtails, swallows; martins, blackbirds, and canary-birds in large flocks. There are also lizards of the common, and another sort; some insects and locusts; and three or four sorts of dragon flies.

"I had an opportunity of conversing with a sensible and well informed gentleman residing here, and whose veracity I have not the least reason to doubt. From him I learnt some particulars, which during the short stay of three days, did not fall within my own observation. He informed me, that a shrub is common here, agreeing exactly with the description given by Tournefort and Linnaeus, of the tea shrub, as growing in China and Japan. It is reckoned a weed, and he roots out thousands of them every year, from his vineyards. The Spaniards, however, of the island, sometimes use it as tea, and ascribe to it all the qualities of that imported from China. They also give it the name of tea; but what is remarkable, they say it was found here when the island was first discovered. Another botanical curiosity, mentioned by him, is what they call *Pregnada*, or impregnated lemon. It is a perfect and distinct lemon, inclosed within another, differing from the outer one only in being a little more globular. The leaves of the tree that produces this sort, are much longer than those of the common one; and it was represented to me as being crooked, and not equal in beauty. From him I learnt also, that a certain sort of grape growing here, is reckoned an excellent remedy in phthical complaints: and the air and climate, in general, are remarkably healthful, and particularly adapted to give relief in such diseases. This he endeavoured to account for, by its being always in our power to procure a different temperature of the air, by residing at different heights in the island; and he expressed his surprize, that the English physicians should never have thought of sending their consumptive patients to Teneriffe, instead of Nice or Lisbon. How much the temperature of the air varies here, I myself could sensibly perceive, only in riding from Santa Cruz up to Laguna; and you may ascend till the cold becomes intolerable. I am assured no person can live comfortably within a mile of the perpendicular height of the Pic, after the month of August. This agrees with Dr. Heberden's account, who says, that the sugar-loaf part of the mountain, or *la pericosa* (as it is called) which is an eighth part of a league, (or 1980 feet) to the top, is covered with snow the greatest part of the year.

"Their trade must be supposed very considerable indeed;

indeed; for they reckon that 40,000 pipes of wine are annually made; the greatest part of which is either consumed in the island, or made into brandy, and sent to the Spanish West Indies. About 6000 pipes were exported every year to North America, while the trade with it was uninterrupted; at present it is thought not half the quantity."—Our readers will here please to observe, that in the foregoing account given by Mr. MILLAR, in his *New System of Geography*, the number of inhabitants in Teneriffe are computed at no less than 96,000. Now we may reasonably suppose, that there has been a considerable increase of population within these 30 years. The quantity of wine annually consumed, as the common beverage of at least 100,000 persons, must amount to several thousand pipes. There must be a vast expenditure of it, by conversion into brandy; to produce one pipe of which, five or six pipes of wine must be distilled. An attention to these particulars will enable every one to judge, that the account given by Mr. Anderson of the annual produce of pipes of wine has a foundation in truth.—This gentleman goes on to observe, "That they make little silk; and, unless we reckon the filtering stones, brought in great numbers from Grand Canary, the wine is the only considerable article of the foreign commerce of Teneriffe."

"None of the race of the family of the Guanches, or ancient inhabitants, found here when the Spaniards discovered the Canaries, now remain a distinct people, having intermarried with the Spanish settlers; but their descendants are known, from their being remarkably tall, large boned, and strong. The men are, in general, of a tawny colour, and the women have a pale complexion, entirely destitute of that bloom which distinguishes our northern beauties. The Spanish custom of wearing black clothes continues among them; but the men seem more indifferent about this, and in some measure dress like the French. In other respects, we found the inhabitants of Teneriffe to be a decent and very civil people, retaining that grave cast which distinguishes those of their country from other European nations. Although, concludes Mr. Anderson, we do not think, that there is a great similarity between our manners and those of the Spaniards, it is worth observing, that Omiah did not think there was much difference. He only said, that they seemed not so friendly as the English; and that, in their persons, they approached those of his countrymen."

We shall now, as proposed, proceed to the relation of a journey up the Pike of Teneriffe, undertaken and performed by Mr. Glas, author of that valuable work, entitled, the *History of the Canary Islands*. This gentleman begins his narrative with informing us, that, "Early in the month of September 1761, at about four in the afternoon, he set out on horseback, in company with the master of a ship to visit the Pike. They had with them a servant, a muleteer, and a guide; and, after ascending above six miles, arrived towards sun set at the most distant habitation from the sea, which is in a hollow: here finding an aqueduct of open troughs that convey water down from the head of the hollow, their servants watered the cattle, and filled some small barrels to serve them in their expedition."

"The gentlemen here alighted, and walking into the hollow, found it very pleasant, as it abounded with many trees of an odoriferous smell; and some fields of maize or Indian corn are near the houses. On their mounting again, they travelled for some time up a steep road, and reached the woods and clouds a little before night. They could not miss their way, the road being bounded on both sides with trees or bushes, which were chiefly laurel, fagine, and brushwood. Having travelled about a mile, they came to the upper edge of the wood, above the clouds, where alighting, they made a fire, and supped; soon after which, they laid down to sleep under the bushes. About half an hour after ten, the moon shining bright, they mounted again, travelled slowly two hours through an exceeding bad road, resembling the ruins of stone buildings scattered over the fields."

"After they had passed over this road, they came upon small light pumice-stone, like shingles; upon which they rode at a pretty good pace for near an hour. The air now began to be pretty sharp and piercing, and the wind blew strong from the south-westward. Their guide advised them to alight here, as the place was convenient, and rest till about four or five in the morning. To this they agreed, and entered the cave, the mouth of which was built up to about a man's height, to exclude the cold. Near this place were some dry withered retamas, the only shrub or vegetable near the cave, and with these they made a great fire to warm themselves, and then fell asleep; but were soon awaked by an itching occasioned by a cold thin air, want of rest, and sleeping in their cloaths. They here passed away their time as well as they could; but while they crept near the fire, one side was almost scorched, and the other was benumbed with cold. At about five in the morning they mounted again, and travelled slowly about a mile; for the road was rather too steep for travelling quick on horseback, and their beasts were now fatigued."

"At last they came among some great loose rocks, where was a kind of cottage built of loose stones, called the English pitching place, probably from some of the English resting here on their way to visit the pike; for none take that journey but foreigners and some poor people who earn their bread by gathering brimstone. There they alighted again, the remainder of their way being too steep for riding, and left one of the servants to look after the horses, while they proceeded on their journey. They walked hard to get themselves warm; but were soon fatigued by the steepness of the road, which was loose and sandy. On their reaching the top of this hill, they came to a prodigious number of large and loose stones, or rocks, whose surfaces were flat, and each of them about ten feet every way."

"This road was less steep than the other; but they were obliged to travel a considerable way round, to leap over the rocks, which were not close to each other. Among them is a cavern, in which is a well, or natural reservoir, into which they descended by a ladder placed there by the poor people for that purpose. This cavern is very spacious, it being almost 10 yards wide, and twenty in height; but all the bottom, except just at the foot of the ladder, is covered with water, which is about two fathoms deep, and was then frozen towards the inner edges of the cave; but when they attempted to drink of it, its excessive coldness prevented them."

"After travelling about a quarter or half a mile upon the great stones, they reached the bottom of the real pike or sugar-loaf, which is exceeding steep, and the difficulty of ascending it increased, and was rendered more fatiguing by the ground being loose and giving way under their feet; for though this eminence is not above half a mile in height, they were obliged to stop and take breath near thirty times; and when they at last reached the top, being quite spent with fatigue, they lay about a quarter of an hour to recover their breath, and rest themselves."

"In the morning, when they left the English pitching place, the sun was just emerging from the clouds, which were spread under them at a great distance below, and appeared like the ocean. Above the clouds, at a vast distance to the north, they perceived something black, which they conjectured to be the top of the island of Madeira, and, taking the bearings of it by a pocket compass, found it to be exactly in the direction of that island from Teneriffe, but before they reached to the tops of the pike, it disappeared. They could neither perceive Lancerota nor Fuerteventura from this place, they being not high enough to pierce the clouds; though they could see from hence the tops of the islands of Grand Canaria, Hiero, Palma, and Gomera, which seemed to be quite near."

"After resting for some time, they began to observe the top of the pike, which is about 140 yards in length, and 110 in breadth. It is hollow, and shaped like an inverted

inverted bell. From the edges of this bell, or cauldron, as it is called by the natives, it is about 40 yards to the bottom, and in many parts of this hollow, they observed smoke and steams of sulphur issuing forth in puffs; and the heat of the ground in particular places was so great, as to penetrate through the soles of their shoes to the feet. On observing some spots of earth, or soft clay, they tried the heat with their fingers, but could not thrust them in farther than half an inch; for the deeper they went, the hotter it was. They then took their guide's staff, and thrust it about three inches deep into a hole or porous place, where the smoke seemed thickest; and having held it there about a minute, drew it out, and found it burnt to a charcoal. They gathered here many pieces of most curious and beautiful brimstone of all colours, particularly an azure blue, violet, scarlet, green, and yellow.

"The clouds beneath them, which are at a great distance, made from hence a very extraordinary appearance: they seemed like the ocean, only the surface was not quite so blue and smooth, but had the resemblance of white wool; and where this cloudy ocean, as it may be called, touched the mountain, it seemed to foam like billows breaking on the shore. When they ascended through the clouds, it was dark; but when they afterwards mounted again, between ten and eleven o'clock, and the moon shone bright, the clouds were then below them, and about a mile distant. They then mistook them for the ocean, and wondered at seeing them so near; nor did they discover their mistake till the sun arose. When they passed through the clouds, in descending from the pike, they appeared as a thick fog or mist, resembling those frequently seen in England; with which all the trees of the wood and their cloaths were wetted.

"The air was thin, cold, and piercing on the top of the pike, like the south-easterly winds felt in the great desert of Africa. In ascending the sugar loaf, which is very steep, their hearts panted and beat violently, and, as hath been already observed, they were obliged to rest above thirty times to take breath; and this was probably as much owing to the thinness of the air causing a difficulty of respiration, as to the uncommon fatigue they suffered in climbing the hill. Their guide, who was a thin, active old man, was far from being affected in the same manner; but climbed up with ease like a goat; for he was one of the poor men who earn their living by gathering brimstone in the cauldron and other volcanoes, the pike itself being no other, though it has burned for some years; for the sugar-loaf is entirely composed of earth mixed with ashes and calcined stones, thrown out of the bowels of the earth, and the great square stones before described, were probably thrown out of the cauldron, or hollow of the pike, when an eruption happened.

"After they had surveyed every thing worthy of notice, they descended to the place where their horses were left, which took them up only half an hour, though they were about two hours and a half in ascending. It was then about ten in the morning, and the sun shone so exceedingly hot, as to oblige them to shelter in the cottage, and being extremely fatigued, they laid down in order to sleep; but were prevented by the cold, which was so intense in the shade, that they were obliged to kindle a fire to keep themselves warm. After this, when they had taken some repose, they mounted their horses about noon, and descending by the same way they went up, came to some pines, situated about two miles above the clouds. Between these pines and the pike, no herb, shrub, tree, or grass can grow, except the before-mentioned retamas.

"At about five in the evening they arrived at Orontava, not having alighted by the way to stop, only sometimes to walk where the road was too steep for riding. The whole distance they rode in the five hours spent in coming down from the English pitching-place to Orontava, they computed to be about 15 English miles, travelling at the rate of three miles an hour.

"Our author supposes, the perpendicular height of

the English pitching place to be about four English miles, and adding to that a mile of a perpendicular height from thence to the pike, observes, that the whole will be about five English miles, and that he is very certain he cannot be mistaken in this calculation above a mile either way." But Mr. Glas may here probably be mistaken, owing perhaps to his not using any instruments proper for ascertaining the exact altitude of this mountain, which is much higher than either the Alps, or the highest part of the Andes, according to this calculation. Dr. T. Heberden makes its height, above the level of the sea, to be 15,396 English feet; and says, that this was confirmed by two subsequent observations by himself, and another made by Mr. Crosse, the Consul. The Chevalier de Borda, commander of the French frigate, now lying with the Resolution in the road of Santa Cruz, was employed, in conjunction with Mr. Varila, a Spanish gentleman, in making astronomical observations for ascertaining the going of two time-keepers which they had on board their ship. The chevalier measured the height of the pike, but makes it to be only 1931 French toises, or 12,340 English feet. If our readers are desirous of more particulars respecting the above subjects, they may find them in Sprat's History of the Royal Society, p. 200, &c. History of the Canary islands by Glas, p. 252, &c. Philosophical Transactions, vol. XLVII. p. 353, &c. and Dr. Forster's Observations during a voyage round the world, p. 32.—Proceed we now to the history of our voyage.

On Sunday, the 4th of August, having taken on board our water, and other necessary articles, we weighed anchor, and sailed from the island of Teneriffe with a fine fresh gale at N. E. between this day and the tenth, our experienced Commander discovered his usual attention and parental care, respecting both the discipline, and health of our company; for in this interval the mariners were exercised at the great guns and small arms, and the Resolution was twice smoked and cleaned between decks. On Saturday the 10th, at nine o'clock P. M. we desiered the island of Bonavista, bearing S. distant one league; at which time we thought ourselves to have been much farther off. We too soon were made sensible of our mistake; for after hauling to the eastward, to clear the sunken rocks that lie near the S. E. point of the island, we found ourselves close upon them, and barely weathered the breakers. Our situation was, for a few minutes, so very critical and alarming, that captain Cook would not permit us to sound, as by so doing we might have increased the danger, without any possibility of lessening it. Having cleared the rocks, we held on a S. S. W. course till day break on the 11th, when we steered between Bonavista and Mayo, to the westward, with the view of looking into Port Praya for the Discovery, as captain Clerke had been informed of our intention to touch at that port, and we knew not how soon he might follow us. At one o'clock P. M. we came in sight of the rocks S. W. of Bonavista, bearing S. E. distant three leagues; and on Monday the 12th, at six o'clock, A. M. the isle of Mayo bore S. S. E. distant five leagues. We now sounded, and found ground at 60 fathoms. At eleven one extreme of Mayo bore E. by N. and the other S. E. by S. In this station two globular hills appeared near its N. E. part; farther on, a large and higher hill; and about two thirds of its length, a single one that is peaked. We were now at the distance of three or four miles from this island, at which we saw not the least appearance of vegetation; nor did any other object present itself to our view, but that lifeless brown, so common in unwooded countries under the torrid zone. During our continuance among the Cape de Verde islands, we had gentle breezes of wind, varying from the S. E. to E. and some calms; from whence we may conclude, that they are either extensive enough to break the current of the trade wind, or that they are situated just beyond its verge, in that space where the variable winds, found on approaching the line, begin. At this time we had sultry and hot weather, attended with rain, and, for the most part the sky was tinged with a thick whiteness, without any transparency, a kind of medium between

tween fogs and clouds. Indeed, the tropical climates seldom have that bright, clear atmosphere, observable where variable winds blow; nor does the sun shine with its full splendor; if it did, perhaps its rays, being interrupted, would occasion an insupportable heat throughout the day; as to the nights, they are often remarkably clear and serene.

On Tuesday the 13th, at nine o'clock, A. M. we were abreast of Port Praya, in the island of St. Jago, of which in former voyages a very particular and full description has been given. At this place two Dutch East India ships, and a small brigantine were at anchor; but the Discovery not being there, and having expended but a small quantity of our water, in our run from Teneriffe, we did not go in, but stood to the southward. We had lost the N. E. trade wind, the day after we left the Cape de Verd islands; and on Friday the 30th, fell in with that which blows from the S. E. being then in 2 deg. N. latitude, and in 25 deg. W. longitude. The wind, during this space of time, was mostly in the S. W. quarter. It generally blew a gentle breeze, but sometimes fresh, and in squalls. We had few calms, and those of short continuance. Between the latitude of 12 deg. and 7 deg. N. the weather was very gloomy, and frequently rainy; which last circumstance was an advantage to us, as we were enabled to have as much water as filled most of our empty casks. Every bad consequence is to be apprehended from these rains, and the close sultry weather with which they are accompanied. Commanders of ships ought therefore carefully to purify the air between decks with fires and smoke, and to oblige the people to change their cloaths at every opportunity; which preservatives of health, with others mentioned in the two former voyages, were constantly used by captain Cook. On the 14th instant a fire was made in the well, to air the ship below: on the 15th, the spare sails were aired upon deck, and a fire made to air the sail room: on the 17th cleaned and smoked between decks; and aired the bread room with fires: on the 21st cleaned and smoked between decks: and on the 22nd, the mens bedding was spread on the deck to air. We enjoyed the salutary effects of these precautions in a high degree, having fewer sick than on either of captain Cook's preceding voyages. Our ship, however, was very leaky in all her upper works. The sultry weather had opened her seams, that had been badly caulked, so wide, that the rain water passed through as it fell. By the water that came in at the sides of the Resolution, the officers in the gun-room were driven from their cabins, and scarcely a man could lie dry in his bed. The sails in the sail-room also got wet, so that, when the weather became favourable to dry them, we found many much damaged, and a great expence of canvas and of time became necessary to make them serviceable. As soon as we had settled weather, the caulkers were employed to repair these defects; but the Captain would not trust them over the sides of the ship while we were at sea; being always more attentive to the preservation of the health and lives of his company, than to temporary inconveniences and hardships.

On Sunday, the 1st of September, in longitude 27 deg. 38 min. W. with a fine gale at S. E. by S. we crossed the equator; and the afternoon was spent in performing the ridiculous ceremony of ducking those who had not passed the line before; a custom we have elsewhere described, and therefore think it sufficient just to mention it in this place. On the 8th we observed in latitude 8 deg. 57 min. S. a little to the southward of Cape Augustine, on the coast of Brazil; and concluded, that we could not now be farther off from the continent than thirty leagues at most, and, perhaps not much less, as we had neither soundings, nor any other signs of land. We held on our course without any remarkable occurrence, till the 6th of October, being Sunday, when, in latitude 35 deg. 15 min. S. and in 7 deg. 45 min. W. longitude, we met with light airs and calms, alternately, for three successive days. We had a few days before been visited by albatrosses, pintadoes, and other petrels, and we now saw three penguins: in consequence of which we sounded, but found no ground

with a line of 150 fathoms. We shot a few birds, one of which was a black petrel, about the size of, and nearly resembling, a crow. On the 8th, in the evening, a bird, which the sailors call a noddy, settled on our rigging, and was taken. It was larger than a common English blackbird, and nearly of the same colour, except the upper part of the head, which is white. It is web-footed, has black legs and a long black bill. It is said these birds never venture far from land, yet in our present latitude, we knew of none nearer than Gough's or Richmond island, which could not be at a less distance from us than one hundred leagues: but as the Atlantic ocean, southward of this latitude, has been but little frequented, there may possibly be more islands than we know of. It is here to be observed, that in the night, we frequently saw the appearance of those marine luminous animals, mentioned and described in captain Cook's first voyage. Many of them were larger than any we had before taken up, and so numerous sometimes, that hundreds were visible at the same moment. The calm weather was succeeded by a fresh gale from the N. W. which continued two days, after which we had variable light airs for about 24 hours, when the N. W. wind returned with renewed strength.

On Thursday the 17th, we came in sight of the Cape of Good Hope; and on the 18th anchored in Table Bay, in four fathoms water. After having received the customary visit from the master attendant and the surgeon, captain Cook sent an officer to Baron Plettenberg, the governor, and, on his return, we saluted the garrison with 13 guns, who paid us an equal compliment. In the bay we found two French East India ships, the one outward, and the other homeward bound. One of the latter, belonging to the same nation, had parted from her cable, and been stranded about three days before our arrival. The crew were saved, but the ship and cargo were plundered and stolen by the inhabitants; in extenuation of which disgraceful act, the Dutch endeavoured to lay the whole blame on the French Captain, for not applying in time for a guard, a plea which cannot exculpate them, when considered as a civilized state. The boat was now ordered out, and captain Cook, attended by some of his officers, went on shore. They waited on the Governor, the Lieutenant-governor or the Fiscal, and the Commander of the troops, by whom they were received with the greatest civility. The Governor, in particular, promised us in the most polite terms every assistance that the place afforded. Before captain Cook returned on board, he ordered bread, meat, vegetables, &c. to be provided every day for the ship's company. By this time our numerous subscribers and readers may be anxious to know what is become of our consort, the Discovery, whom we left at anchor, on the 12th of July, in Plymouth Sound, waiting for the arrival of her commander, captain Clerke. We shall therefore, for the information of our friends, make a trip to Plymouth, and attend the Discovery in her run to Table Bay. By the latter end of July, this ship being in readiness, and every thing necessary got on board, captain Clerke gave orders to prepare for sailing; in consequence of which,

On the 1st of August we weighed, with all sails set, to join the Resolution. While our ship was repairing, it was observable, that those who had never been employed on discovery before, were more impatient to depart, than those who had already experienced the severities of a southern navigation near and within the polar circle. It was diverting enough to listen to the ludicrous remarks of these last; on their fresh water brethren as they called them, whom they ventured to foretel, would, like the Jews in the wilderness, be the first to murmur and cry out for the leeks and the onions of Egypt; intimating thereby, that when these raw sailors came among the islands of ice in the frozen regions, to feel the effects of scanty fare and hard duty, they would then be the first to repent their impetuosity, and to sigh for the beef and the beer of the land they were now so desirous to leave.

We proceeded with a brisk gale till the 7th; when in sight of Cape Finisterre the clouds began to darken, and the ocean to swell, and to threaten by every appearance

an approaching tempest. Several ships were then in sight, and we could clearly discern that they were preparing as well as ourselves, to meet the storm. For twenty-four hours it blowed and rained incessantly; but on the 9th a calm succeeded, which however was not of long continuance; for in the evening of the same day it thundered, lightened, and the rain poured down in torrents. The drops were such as no experienced seaman on board had seen the like. To prevent the effects of the lightning, it was thought necessary to let fall the chain from the mast-head; a precaution which captain Clerke never omitted when there was danger from the accumulation of electrical matter in the atmosphere to be apprehended. On the 10th, seeing a ship to windward bearing down very fast, and suspecting her to be an American privateer, all hands were ordered to quarters, to be in readiness to engage. She proved to be a Lisbon trader, who by the violence of the gale the day before, had been driven many leagues to the westward of her course, and was in some distress. We spared her those things of which she stood most in need, and pursued our voyage. Nothing remarkable happened till the 18th, when the ship's company were put to short allowance of water, and the still was worked to procure a supply of fresh from the sea. This was occasionally used, and answered very well for some particular purposes, but was ill relished by the sailors for boiling their meat. These precautions were taken lest the *Resolution* should have left St. Jago, and the *Discovery* might be obliged to proceed to the Cape, without being able to procure a fresh supply. On the 19th we crossed the Tropic of Cancer for the first time, and, on the 28th, came in sight of St. Jago, bearing N. W. distant seven leagues. We bore away instantly for the bay, and at eight in the morning made land. An officer was sent ashore with all speed to make enquiry, who brought word back, that the *Resolution* had touched at that port; but had hastened her departure, as the rainy season was approaching, and it was unsafe to remain there long during its continuance. The same reasons that had induced the *Resolution* to proceed were doubly pressing upon us. It was now the time when the rainy season prevails, though we had as yet observed none of its approaches. It is generally preceded by a strong southerly wind, and a great swell. The sea comes rolling on, and dashing furiously against the rocky shore, causes a frightful surf. Sometimes tornadoes or furious whirlwinds arise near the coast, and greatly increase the danger. For this reason, from the middle of August till the month of November, Port Praya is but little frequented. The officer was no sooner returned, and the boat hoisted on board, than we made sail with a gentle breeze.

On the 1st of September a dreadful tempest arose, by which we every moment expected to be swallowed up. The thunder and lightning were not more alarming than the sheets of rain, which fell so heavy as to endanger the sinking of the ship, and, at the same time, though in the open day, involved us in a cloud of darkness, than which nothing could be more horrible: providentially the continuance of this tempest was but short: it began about nine in the morning, and before noon the whole atmosphere was perfectly serene, and not a spot nor a shade to be seen to mark the place of this elemental conflict. However in this short period, our sufferings nearly kept pace with our apprehensions, having our main-top-gallant yard carried away in the flings, and the sail frittered in a thousand pieces; the jib and middle stay-sails torn clear off, and the ship so strained as to make all hands to the pump necessary. The afternoon was employed in repairing the damages, and discharging the water which had been shipped as well from the heavens, as from the sea. On the three days following, the weather continued squally with rain; but as we approached the line, a calm succeeded, and the sky became serene; but with a haziness and languor, as if the current of air, like water upon an equipoise, moved only by its own impulse. Nothing could be more tedious and disagreeable than this calm; but fortunately it was of short continuance. September the

5th, at eight in the morning saw a sail, the second we had seen since we passed Cape Finisterre on the coast of Spain. We were at this time intent on fishing; and having hooked a shark of an enormous size, both officers and men were engaged in getting him on board. When he was cut up, there were six young ones found in his belly. These were divided among the officers, and one was dressed for the great cabin. The old one was eaten by the ship's crew, to whom fresh meat of any kind was now become a dainty. The weather continuing fine, the Captain ordered the great guns and small arms to be exercised, the ship to be smoaked, and the bedding to be aired. These last articles, it may be once for all necessary to observe, were never omitted during the whole course of the voyage, when the weather would permit; and they are more particularly necessary in crossing the line, as it has been observed, that the whole woodwork between decks, in this low latitude, is more apt to become mouldy, and the iron to rust, than in higher latitudes, probably owing to that sluggishness in the air that has been already noticed, and for which nature seems to have provided a remedy by the frequent tempests and tornadoes, to which this part of the ocean is remarkably subject.

On the 17th, we crossed the equator. The weather being squally, the usual ceremony of keel-hawling the sailors who had never crossed it before, was omitted. On the 20th the weather became moderate, when, upon examination, the starboard main-trussel-tree was found to be sprung. This day George Harrison, corporal of the marines, sitting carelessly on the bowsprit, and diverting himself with the sporting of the fishes, fell overboard. He was seen to fall, and the ship was instantly hove to, and the boats got out with all possible expedition, but he was never again seen to rise. His Dutch cap was taken up at the ship's stern; and as it was known that he could swim as well as any man on board, the boats made a large circuit round the ship, in hopes to recover him, but in vain. It is remarkable, that in Captain Cook's former voyage, Henry Smock, one of the carpenter's mates, sitting on the skuttle, fell overboard about the same place, and shared the same fate. Both these were young men, sober, and of good characters. Their loss was regretted by the officers, and particularly so by their comrades among the crew. It is more than probable that both were instantly swallowed up by the sharks that constantly attend the ships.

On the 1st of August we caught a large shark, 10 feet long, with several young dolphins in her belly. Part of the entrails, when cleansed and dressed, were eaten in the great cabin, and the body given to those by whom it was caught. When fried, it is tolerable meat; but the fat is very loathsome. On the 15th, a storm arose, accompanied with thunder and rain. As it was not so violent as those we had before experienced, it proved more acceptable than alarming, as it supplied the ship's company with a good quantity of fresh water, which we caught in blankets, or by other contrivances, every one as he could. What was saved by means of the awnings was set apart for the officers use. On the 20th it blew a hurricane, which obliged us to hand the sails, and to lay to under bare poles. On the 25th the storm abated, and the sky became clear. This day we observed a ship to the southward, which, by her course, we took for the *Resolution*: we crowded sail, stood after, and soon came up with her. She proved to be a Dutch advice boat, bound to the cape. On the 28th, our people began to look for land; and the appearance of some birds which are known never to go from shore, confirmed them that the extremity of the African coast was at no great distance. Our astronomer, however, was of a different opinion, and the event proved that he was right.

On the first of October, when we had been at sea just two months, without once setting foot on land, those who were unaccustomed to long voyages, began to put on a very different aspect to that they wore at first setting out. They were, indeed, somewhat comforted by the cheerfulness and vivacity which they ob-

served to prevail in almost every countenance except their own; from whence they concluded, that many days could not elapse before the painful sensations of a solitary sea life would be recompensed by the pleasurable enjoyments they would find when they came on shore. On the 3d, we observed a great variety of fish and fowl to accompany the ship, some of which we had not noticed before; and we could not but remark the difference in this respect, between the western coasts of the old continent, and the western coasts of the new, in the same latitudes. No sooner had we crossed the Tropic of Cancer, than we were amused by the sporting of the fishes, or more properly, perhaps, by their unremitting labour in pursuit of their daily food. Flying fish are generally the first to attract the notice of those who never have been in these seas before, and it is curious to attend to their numberless windings and shiftings to elude the attacks of the dolphins and bonitos, their declared enemies. Whatever may be the design of providence in the formation of these creatures, one cannot help considering their existence as a state of perpetual punishment. While they remain in the water their enemies are near, and though nature has given them the power to quit that element, and to fly for refuge to the open air, yet other persecutors are there also in wait for them, no less cruel than those they have escaped. Boobies, man of war birds, and other sea-fowls, are continually watching to make the flying-fish their prey, while the ravenous sharks are no less vigilant in making reprisals on the dolphins and bonitos. Thus a passage through the tropical latitudes in this sea, exhibits one continued scene of warfare; while in the other sea all is peace and uniform tranquility. These reflections occur naturally when the mind, unoccupied with variety, is disposed for contemplation. On the 4th of November we caught a shark, leaving one tyrant the less to vex the ocean. On the 7th, at six in the morning, the man at the mast head called out land; and at eight we could all see it involved in a misty cloud. It proved to be Table Land, bearing S. W. at the distance of about 10 leagues, which induced us to change our course from E. S. E. to S. S. W. On the 10th we entered Table Bay, and on the 11th came to an anchor in six fathoms water, where, to our great joy, we found the *Resolution*, on board of which our journalist embarked, and thus continues the history of her voyage.

On Tuesday the 22d of October, we fixed our tents and observatory; and on the 23d began to observe equal altitudes of the sun, in order to discover whether the watch had altered its rate. The caulkers were now set to work, and Captain Cook had before concerted measures with Mess. Brandt and Chiron for supplying us with such provisions as were wanted; and as the several articles for the *Resolution* were got ready, they were immediately conveyed aboard. The homeward bound French ship sailed for Europe on Saturday the 26th, and by her we sent letters to England. On the day following the Hampshire East Indiaman, from Bencoolen, anchored in the bay, and saluted us with 13 guns, and we returned eleven. On the 31st, it blew excessively hard at S. E. and continued for three days; whereby all communication between the ship and the shore was cut off. The *Resolution* was the only ship in the bay that rode out the gale, without dragging her anchors. The effects were as sensibly felt on shore; where the tents and observatory were destroyed, and the astronomical quadrant narrowly escaped irreparable damage.

On Sunday the 3d of November the storm ceased; and on the 6th, the Hampshire sailed for England, in which Captain Cook sent home an invalid. Captain Trimble would have received two or three more of our crew, who were troubled with different complaints, but, at this time, we entertained some hopes of their health being re-established. Monday the 11th, the *Discovery* having anchored saluted the garrison with 13 guns, and were answered by the same number; after which Captain Cook, with his principal officers and gentlemen went on board that ship, to welcome Captain Clerke on

his arrival. It being intimated that the *Discovery* wanted caulking, Captain Cook ordered all our workmen on board her, and lent every other necessary assistance to expedite a supply of water and provisions. The bakers had omitted to bake the bread that had been ordered for the *Discovery*, pretending they wanted flour; but the truth was, they did not chuse to begin till they saw her moored in the bay. On Captain Clerke's landing this day, he was met by the officers of the garrison, and the gentlemen belonging to the East India Company, who received him very politely, and gave him a general invitation to share with them the entertainments of the place. The subordinate officers were met by another class of inferior gentry, belonging to the same company: for almost all the officers in the pay of the Dutch Company entertain strangers, and board them on moderate terms, from two shillings a day to five. Having by the governor's permission got our cattle on shore, on the night of the 13th, some dogs broke into the pens, and, forcing the sheep out, killed four, and dispersed the rest. The number of our sheep were sixteen, which were penned up, every night, close to our tents; but a bull and two cows, with their calves, were sent to graze along with some other cattle.

On the 14th, we recovered six of our sheep, but among those we missed were two rams, and two of the finest ewes in the whole flock. Though the Dutch frequently boast of the police at the Cape, yet the Captain's sheep evaded all the vigilance of the Fiscal's officers and people. At length, after much trouble and expence, by employing some of the meanest scoundrels of the place, we recovered all but the two ewes. One of the rams, however, was so miserably torn by the dogs, that we thought he could not live. Mr. Hemmy, the lieutenant governor, very obligingly offered to make up this loss, by giving Captain Cook a Spanish ram, out of some he had sent for from Lisbon; but the captain declined the offer, thinking it would equally answer his purpose to take with him some of the Cape rams: in this, however, the captain was mistaken. Mr. Hemmy had endeavoured to introduce European sheep at the Cape; but all his attempts were frustrated by the obstinacy of the country people, who highly esteem their own breed, on account of their large tails, the fat of which produces more money than the whole carcass besides. Indeed, the most remarkable thing in the Cape sheep is the length and thickness of their tails, which weigh from 10 to 15 pounds. The fat is not so tallowish as that of European mutton, and they use it instead of butter. While we continued at the Cape, our commander had lain in a sufficient store of beef, mutton, poultry, and greens, for present use, and had contracted for a good quantity of salted beef, to save what we had brought from England, as the latter will keep better than that which is salted at the Cape. What remained to be done, was chiefly to purchase live cattle for presents to the chiefs in the South Sea: likewise live stock for the ship's use; these are always the last things provided, because it is found necessary to shorten, as much as possible, their continuance on board. Among the cattle purchased, were four horses and mares of a delicate breed, for Omiah; several bulls and cows of the buffalo kind, as more suitable to the tropical climates than any brought from Europe; likewise some African rams and ewes; dogs of the she kind, some with and some without puppies; cats we had plenty on board, and goats Captain Cook had purchased at St. Jago. Stored with these, the *Resolution* resembled the Ark, in which pairs of all the animals that were to stock the earth were collected; and with their provender, they occupied no small part of the ship's stowage. While the riggers, sail-makers, caulkers, smiths, coopers, and store-keepers, were busily employed in their several stations, the astronomers were not idle, nor the surgeons: the former were employed in making observations; the latter in attending the sick, of whom there were not many, and those, on being carried to the tents, very soon recovered. The dry soft air of the African mountains proved a restorative superior to

to all the physic in the world. Of the efficacy of this salubrious air, the Dutch East Indiamen have experience every voyage, both in going to and returning from their settlements in India. During the time the Resolution and Discovery lay in the bay, two of their ships arrived full of sick soldiers, who had been enlisted in Holland, and who were in a miserable condition both as to health and want of common necessaries. They had been near five months on their voyage from Amsterdam, and had lost on the passage more men than the complements of both our ships amounted to, owing to nastiness and close confinement. It is remarkable, observed one of our gentlemen, that no ships have the appearance of being kept neater than those of the Dutch; nor any more slovenly where they are not exposed to open view.

Nor must we omit here the account in the journal of Mr. Anderson, who, while the two ships were repairing for the prosecution of their voyage, made an excursion, to take a survey of the neighbouring country. Mr. Anderson, surgeon, relates their proceedings, in substance, as follows:

In the forenoon of Saturday the 16th of November, Mr. Anderson, and five others, set out in a waggon, to take a view of the country. They crossed a large plain to the eastward of the town, which is entirely a white sand, resembling that which is commonly found on beaches. At five in the afternoon they passed a large farm-house, some corn-fields, and vineyards, situated beyond the plain, near the foot of some low hills, where the soil appeared worth cultivating. At seven they arrived at Stellenbosch, a colony, in point of importance, next to that of the cape. The village stands at the foot of the range of lofty mountains, above 20 miles to the eastward of Cape Town, and consists of about 30 houses, which are neat and clean: a rivulet, and the shelter of some large oaks, planted at its first settling, form a rural prospect in this desert country. There are some thriving vineyards and orchards about the place, which seem to indicate an excellent soil, though perhaps much may be owing to the uncommon fertility of the air. At this season of the year, Mr. Anderson could find but few plants in flower, and insects were very scarce. Having examined the soil, he found it to consist of yellowish clay, mixed with a good deal of sand. The sides of the low brown hills, seemed to be constituted of a kind of stone marble. Mr. Anderson and his companions left Stellenbosch the next morning, and soon arrived at the house they had passed on Saturday; Mr. Cloeder, the owner of which, having sent them an invitation to visit him. This gentleman received them with politeness, and entertained them with hospitality, in a manner very different from what was expected. They were received with a band of music, which continued playing while they were at dinner; a compliment, considering the situation of the place, we thought elegant. In the afternoon they crossed the country, and passed some large plantations, one of which was laid out in a taste different from those they had seen. In the evening they arrived at a farm house, said to be the first in the cultivated tract, called the Pearl. Here they had a view of Drakenstein, the third colony of this country, which contains several little farms or plantations. Insects and plants were as scarce here as at Stellenbosch, but there was a greater plenty of shrubs, or small trees, naturally produced, than they had before seen in the country. On Tuesday the 19th, in the afternoon, they went to see a remarkable large stone, called by the inhabitants, the Tower of Babylon, or the Pearl Diamond. In the Philosophical Transactions is a letter from Mr. Anderson to Sir John Pringle describing this stone. The account sent home from the cape and read before the Royal Society is much the same with that here published, but rather fuller. In particular, he tells Sir John, that he went to see it at Mr. Maillon's desire, who, probably, had not had an opportunity of sufficiently examining it himself. With his letter to Sir John Pringle, Mr. Anderson also sent home a specimen of the rock; it was examined by Sir William Hamilton, whose opinion is, that this singular,

immense fragment of granite, most probably has been raised by a volcanic explosion, or some such cause. This remarkable stone, to use Mr. Anderson's own words, in the papers now before us, "lies, or stands, upon the top of some low hills, at the foot of which our farm houses was situated; and though the road to it is neither very steep nor rugged, we were above an hour and a half in walking to it. It is of an oblong shape, rounded on the top, and lies nearly N. and S. The E. and W. sides are steep, and almost perpendicular. The south end is likewise steep, and its greatest height is there; from whence it declines gently to the North part, by which we ascended to its top, and had a very extensive prospect of the whole country. Its circumference, I think, must be at least half a mile; as it took us above half an hour to walk round it, including every allowance for the bad road, and stopping a little. At its highest part, which is the south end, comparing it with a known object, it seems to equal the dome of St. Paul's Church. It is one uninterrupted mass of stone, if we except some fissures, or rather impressions, not more than three or four feet deep, and a vein which runs across near its north end. It is of that sort of stone called *Saxum conglutatum*, and consists chiefly of pieces of coarse quartz and glimmer, held together by a clayey cement. But the vein which crosses it, though of the same materials, is much compact. This vein is not above a foot broad or thick, and its surface is cut into little squares or oblongs, disposed obliquely, which makes it look like the remains of some artificial work. But I could not observe whether it penetrated far into the large rock, or was only superficial. In descending we found at its foot, a very rich black mould: and on the sides of the hills some trees of a considerable size, natives of the place, which are a species of the olea."—We cannot help thinking, it is strange, that neither Kolben nor de la Caille should have thought the Tower of Babylon worthy of a particular description. The former only mentions it as a high mountain: the latter contents himself with telling us, that it is a low hillock, but the very accurate account given of this remarkable rock by Mr. Anderson, agrees with Mr. Sonnerat's, who was at the Cape of Good Hope so late as 1781. On the 20th in the morning, the gentlemen set out from the Pearl, and, going a different road, passed through an uncultivated country to the Tyger Hills, where they saw some good corn fields. About noon they stopped in a valley for refreshment, where they were plagued with a vast number of musketoes; and, in the evening, arrived at the Cape-Town, tired sufficiently with the jolting of the waggon.

A very uncommon incident happened during our stay at the Cape, which might have embroiled us with the government there, had not the delinquent been found out and punished. It was discovered that a number of counterfeit schellings, and double keys, had been circulated, and several of our people had taken them in exchange for gold. Complaint was made by our officers against the inhabitants, for taking the advantage of the ignorance of strangers to impose counterfeit money upon them, as it was not to be supposed that they could be judges of the goodness of their country coin. On the other hand, the inhabitants retorted the charge, affirming that the bad money proceeded from us. Each were warm in their allegations, and each were positive in their opinions. It was not thought possible, that any of our people could be prepared to counterfeit Dutch money, and yet there had never been an instance of counterfeit money having been seen at the Cape before the arrival of our ships at that port. Thus the matter rested for some time, till one of the ship's cooks, having obtained leave to go ashore, made himself drunk, and offered base money in payment for his liquor. Being detained, and notice given to his commanding officer, he caused him to be searched, when several other pieces of a base coin were found upon him; and on examining his chest, the implements were found artfully concealed, by which he had been enabled to carry on the fraud. He was instantly de-

livered up to the Dutch Governor, to be tried by the laws of the country where the offence had been committed; but it not being clear, whether the crime of coining was committed on shore, or on board his Britannic Majesty's ship, the Magistracy very politely returned him, to be dealt with as the Commander in Chief should think proper; who not being vested with the power of life and death in civil cases, ordered him to receive the discipline of the ship, and to be sent home in the Hampshire Indiaman. Thus ended a very critical affair, of which there is, we believe, no instance upon record.

On Saturday, the 23d of November, we got the observatory clock, &c. on board. From the result of several calculations and observations, we had reason to conclude, that the watch, or time-piece, had performed well all the way from England. On the 27th orders were given to prepare for sailing; and, fearing a second disaster, we got our sheep and cattle on board as fast as possible. The caulkers had finished their work on board the Discovery, and she had received all her provisions and water. Of the former, both ships had a sufficient supply for two years and upwards. A large quantity of beer was purchased for the companies of both ships, at the only brewery that is publicly tolerated within the jurisdiction of the town. In short, there is not one necessary article relating to the repairing, providing, and victualling of shipping, that is not to be purchased at the Cape of Good Hope, and that too at very reasonable prices. The wine at the Cape has been thought dear, because that of the choicest vintage is scarce, and confined to a very small spot. Of the real Constantia, which is the wine so much prized in Europe, the whole plantation does not perhaps produce more than forty pipes annually, though there may be two or three hundred disposed of under that name. The wine commonly taken on board the shipping for the officers, is of a kind not unlike the Madeira, but of an improved flavour, the vines here being highly sublimed by the warmth of the sun and the dryness of the soil. On Thursday the 28th, the Governor and principal officers belonging to the company were entertained on board the Resolution, where they came to take leave

of our Captains, as we expected to sail in a few days, all our live stock being properly secured on board, and the repairs of both ships being fully completed. On the 30th, captain Cook having given to captain Clerke a copy of his instructions, and our letters having been dispatched to our friends, we quitted our moorings, and next day came to an anchor in 18 fathoms water, Penguin island bearing N. by W. six miles: but before we take our final departure, it may not be amiss to observe, that nothing in nature can make a more horrid appearance than the rugged mountains that form Table Bay. One would almost be tempted to think, that the Dutch had made choice of the most barren spot upon earth, to shew what may be effected by slow industry, and continued perseverance; for besides the craggy cliffs that render the open country almost inaccessible, the soil is so sandy and poor, that, except some vineyards, there is scarce a shrub or a tree to be seen within any walking distance from the place; insomuch, that the vast profusion of all sorts of provisions, as beef, mutton, poultry, flour, butter, cheese, and every other necessary, is brought from four to five and twenty days journey from Cape Town, where the Governor and Company have their residence. This town, as our readers may recollect, we have fully described in our history of former voyages, so that little remains to be said, or added in this part of our work. The town is neatly built, and, according to the natural taste and character of the Dutch, as neatly kept in order. It has the advantage of a small rivulet, by means of which there are canals in all the principal streets, on both sides of which are planted rows of stately oaks. The town is situated below the mountains, and when seen from their summits, appears, with the gardens and plantations that run along the shore exceedingly picturesque: nothing, indeed, can be more romantic, nor any prospect more pleasing to the eye. At five in the afternoon of this day, a breeze sprung up at S. E. with which, as we observed above, we weighed, and stood out of the bay, having saluted the fort with eleven guns, which they returned with an equal number: at nine o'clock it fell calm, and we came again to anchor.

C H A P. II.

Passage of the Resolution and Discovery, from the Cape of Good Hope, to Christmas Harbour; in which Prince Edward's islands are seen, and Kerguelen's land visited—The two ships arrive at the above harbour—Description of it, and an account of occurrences there—Depart from thence, and explore the coast—Cape Cumberland Bay, Point Pringle, Howe's Foreland, &c. described—The ships in danger from shoals—Arrive at Port Palliser—Cape George described—Natural history of the animals, plants, soil, &c. of Kerguelen's land—Passage from hence to Van Diemen's land, in which the Resolution is damaged by a sudden squall—They arrive in Adventure Bay—Incidents there—Various interviews with the natives, and a description of their persons, dress, manners, and customs—Mr. Anderson's remarks—Course of the Resolution and Discovery to Queen Charlotte's Sound in New Zealand, where we anchored in our old station.

DECEMBER the 1st, 1776, at three o'clock A. M. we weighed and put to sea, with a light breeze at S. but did not get clear of the land till the 3d in the morning, when, with a fresh gale at W. N. W. we stood to the S. E. At this time we observed that luminous appearance about our ship, which different navigators have attributed to different causes, but which Dr. Franklin has endeavoured to account for on the principles of electricity. About five in the afternoon, we met with one of those terrible gists so frequently experienced by mariners in doubling the Cape of Good Hope, in which our main-sail was split, but fortunately we received no other damage; the southernmost land now bore S. by E. distant nine or ten leagues, both ships in company. On Wednesday the 4th in the morning, it blew a hurricane, and split the jib of the Discovery; and on the 5th a squall of wind carried away our mizen top mast, but having another to replace it, the loss was not felt. On the 6th, in the evening, being in latitude 39 deg. 14 min. S. and in 23 deg. 56 min. E. longitude, we ob-

served several spots of water, of a reddish hue. Upon examining some of this water that was taken up, we perceived a number of small animals, which the microscope discovered to resemble cray-fish. We continued to the S. E. followed by a mountainous sea, which occasioned the ship to roll exceedingly, and rendered our cattle troublesome. Several goats, especially the males, died, and some sheep. On the 8th, the weather that had been cloudy and boisterous ever since leaving the Cape, became clear and moderate. In latitude 39 deg. 57 min. S. Mr. King, our second mate, went on board the Discovery to compare the time-pieces, and found no material variation. On the 10th, in latitude 43 deg. 56 min. S. a dreadful storm came on, which obliged both ships to lie to that and the following night under bare poles. On the 11th in latitude 46 deg. 18 min. S. it began to snow and hail, and the weather became intolerably cold; insomuch, that from a scorching heat which we felt at the Cape, the change was so great, that we were obliged to line the hatchways with can-

vas, to defend the men below as much as possible from the effects of the frost. Here the albatrosses, and other sea birds, began to make their appearance; and seals, and porpoises were seen to sport about the ships, which gave us hopes of soon approaching land. This we discovered, having the appearance of two islands, on Thursday the 12th at noon. That to the S. which is the largest, we judged to be about 15 leagues in circuit; and to lie in latitude 46 deg. 53 min. S. longitude 37 deg. 46 min. E. The most northerly one is about 9 leagues in circuit; and in latitude 46 deg. 40 min. S. longitude 38 deg. 8 min. E. The distance from one to the other is about five leagues. We passed through between both islands in a very narrow channel; and had piercing cold, attended with snow, with which the islands were lightly covered; but neither tree nor shrub were to be seen with our best glasses, nor any living thing, except penguins and shags, the former so numerous that the rocks seemed covered with them as with a crust. The S. E. parts of these two islands had a much greater quantity of snow on them than the rest, and the ground that was not covered by it, from the various shades it exhibited, may be supposed to be clothed with moss, or perhaps, with such a coarse long grass as is found in some parts of Falkland's islands. On the N. side of each of the islands is a detached rock; that near the S. one is shaped like a tower, and seemed to be at some distance from the shore. These two islands, and four others more to the east, were discovered by the two French navigators, Marion du Frezne, and Crozet, in January 1772, on their passage from the Cape of Good Hope to the Philippine islands. M. de Marion had two ships under his command, one the *Mascarin*, captain Crozet, the other the *Castrie*, captain du Clefsmure. They proceeded to the southern extremity of New Zealand, and from thence to the Bay of Islands in New Zealand, where M. de Marion was killed with twenty-eight of his men by the natives. He was obliged, having lost his masts, to look out for new ones in this country; but when he had found trees fit for his purpose, necessity obliged him to cut a road three miles long through the thickets, to bring them to the water side. While one party of his people were employed in this service, another party was placed on an island in the bay, to cleanse the casks, and fill them with water; and a third was occasionally sent on shore to cut wood for the ship's use. Thus employed, they had been here 33 days upon the best terms with the natives, who freely offered their women to the sailors, when M. de Marion, not suspecting any treachery, went one morning, as was his custom, to visit the different parties that were at work, without leaving word that he intended to come back to the ships the same day. Having called, to see the waterers, he went next to the *Hippah*, a fortification of the natives, where he commonly used to stop in his way to the carpenters, encamped in the woods, with M. Crozet at their head, to direct their operations. Here he was suddenly set upon; and, with his few attendants, barbarously murdered; as were the boats crew that carried him on shore. Next morning, the lieutenant who commanded on board, not knowing what had happened, sent a party to cut wood, and when every one was at work, the natives watched the opportunity to fall upon them likewise, and butchered every one, except a single sailor, who ran for his life, and threw himself, wounded, into the sea. Being seen from the ships, he was speedily taken on board, and gave the general alarm. Crozet's situation in the woods, with his small party, was now become most critical. A corporal and four marines were dispatched immediately to acquaint him of his danger, while several boats attended to receive his people, at a place where the sick had been lodged in the tents, for the recovery of their health. He disposed every thing as well as the time would permit, and effected his retreat to the sea side. Here he found multitudes assembled, dressed in their habits of war, with several chiefs at their head. Captain Crozet ordered the marines who attended him, to direct their fire, in case he found it necessary to give the word, against such persons as he should point out. He then com-

manded the carpenters and convalescents to strike the tents, and the sick to embark first, with their whole apparatus, while he with the soldiers, should talk with the chief. This man immediately told them, that M. Marion was killed by another chief; upon which captain Crozet seized a stake, and, forcing it into the ground, made signs that he should advance no farther. The countenance, with which this action was attended, startled the savage, whose timidity being observed by Crozet, he insisted on his commanding the crowd to sit down, which was accordingly complied with. He now paraded in front of the enemy till all his people were embarked; his soldiers were then ordered to follow, and himself was the last who entered the boat. They had scarce put off when the whole body of natives began their song of defiance, and discharged their volleys of stones; however, a shot from the ship soon dispersed them, and the company got all safe on board. From this time the natives began to be troublesome, and made several attempts to attack his people by surprise. They formed an attack against the watering party in the night, which, but for the vigilance of the guard, would have been fatal to them: after which, they openly attacked the ships in more than a hundred large canoes, full of men, who had cause sufficient to repent their daring exploit, having severely felt the destructive effect of European arms. At length captain Crozet, finding it impossible to supply the ships with masts, unless he could drive the enemy from his neighbourhood, made an attack upon their *Hippah*, which they vainly boasted was beyond his power to approach. He placed the carpenters in the front, who, in an instant, levelled their palisades with the ground; then cut a breach through the mound, and levelled the ditch, behind which their warriors were ranged in great numbers on their fighting stages. Into this breach a chief instantly threw himself, with his spear in his hand. He was shot dead by a marksman, and immediately another chief occupied his place, stepping on the dead body. He likewise fell a victim to his intrepid courage, and in the same manner eight warriors successively defended it, and bravely fell in this post of honour. The rest, seeing their leaders dead, took flight, and the French pursued and killed numbers of them. Captain Crozet offered fifty dollars to any person who should take a New Zealander alive, but this was found impracticable. A soldier seized an old man, and began to drag him towards his Captain, but the savage, being disarmed, bit into the fleshy part of his enemy's hand, the exquisite pain of which so much enraged the soldier, that he ran the fellow through with his bayonet. In the *Hippah*, that had been stormed, was found great quantities of arms, tools, and cloathing, together with store of dried fish and roots, which seemed to be intended for winter provision. Captain Crozet now completed the repairs of his ship without interruption, and prosecuted his voyage after a stay of sixty four days in the Bay of Islands: from whence, after passing through the western part of the South Sea, he returned, by the Philippines, to the Isle of France.

We cannot help remarking here, that there appears some inconsistency in the above relation. It seems improbable, if Marion was murdered in the *Hippah*, situated on the prominence of an inaccessible rock, that the boat's crew below, who landed him, should not make their escape; and much more improbable, that neither the leader nor his followers should be missed, till the woodmen were massacred by the savages the next day. Upon the whole, we are rather inclined to think, considering the importance of the place, that the loss might be sustained by fair combat. M. Marion might find it necessary for the safety of his people, to drive the savages from their *Hippah* or Fort, which is one of the strongest in New Zealand. In the opinion of captain Cook, it is a place of great strength, in which a great number of resolute men may defend themselves against all the force, which a people with no other arms than those that are there in use, could bring against it. Captain Crozet might, therefore, think it less dishonourable to attribute the loss of his general

and so many men, to the treachery, rather than the valour of the savages; who, it is acknowledged, defended the place bravely. But to proceed.

As the two islands, between which we passed, have no names in the French chart of the southern hemisphere, captain Cook named them Prince Edward's islands, and the other four Marion's and Crozet's islands. We had now for the most part strong gales between the N. and W. and but very indifferent weather; not better, indeed, than we generally have in England in the very depth of winter, though it was now the middle of summer in this hemisphere. In consequence of the piercing cold, the captain ordered the jackets and trowsers to be delivered out, which, with the blankets, and other warm cloathing, provided by the Lords of the Admiralty against the severity of the frozen climates, were found of infinite use in preserving the men in health, who were most exposed to the action of the frost. After leaving Prince Edward's islands, we shaped our course to the S. E. with a brisk gale at W. S. W. in order to pass to the southward of the four others; and to get into the latitude of the land discovered by M. de Kerguelen. Captain Cook had received instructions to examine this island, and endeavour to discover a good harbour.

On Monday the 16th, in latitude 48 deg. 45 min. and in longitude 52 deg. E. we saw numbers of penguins, and rock-weed floating in the sea. On the 17th the fogs came on so thick, that we could but just discern objects at the distance of the ship's length; on account of which signals were appointed, and repeated every half hour. As we hourly expected to fall in with land, our navigation was both tedious and dangerous. On the 21st, we saw a very large seal, and a heavy storm came on, attended with fleet and heavy gusts of hail. On Tuesday the 24th, at six o'clock, A. M. the fog clearing away a little, we saw land, bearing S. S. E. which we afterwards found to be an island of considerable height, and about three leagues in circuit. We soon after discovered another of equal magnitude, about one league to the eastward; and between these two some smaller ones. In the direction of S. by E. another high island was seen. This we did but just weather: it was a high round rock, named Bligh's Cap. Our commander supposed this to be the same that M. de Kerguelen called the isle of Rendezvous; but we know of nothing that can rendezvous upon it but the birds of the air, for it is certainly inaccessible to every other animal. The weather beginning to clear up, we tacked, and steered in for the land; and at noon we determined the latitude of Bligh's Cap to be 48 deg. 29 min. S. longitude 68 deg. 40 min. E. We passed it at three o'clock, with a fresh gale at W. standing to the S. S. E. Presently after we saw the land of which we had a faint view in the morning; and at four o'clock, extending from S. E. half E. and distant 4 miles. The left extreme, which we judged to be the northern point of this land, called, in the French chart of the southern hemisphere, Cape François, terminated in a high perpendicular rock, and the right one in a high indented point, which, by its appearance, seemed to be, what is represented on Kerguelen's chart under the name of Cape Aubert. It may be proper to observe here, that all that extent of coast lying between Cape Louis and Cape François, of which the French saw very little during their first visit in 1772, and may be called the N. W. side of this land, they had it in their power to trace the position of in 1773; and have assigned names to some of its bays, rivers, and promontories. From this point the coast seemed to turn short round to the southward; for we could see no land to the westward of the direction in which it now bore to us, but the islands we had observed in the morning. Kerguelen's isle de Clugny, the most southerly of them, lies nearly W. from the point, about two or three leagues distant. Towards the middle of the land there appeared to be an inlet; but on our approaching it, we saw it was only a bending on the coast: we therefore bore up to go round Cape François. Soon after, land opened off the Cape, in the direction of S. 53 deg. E. appearing as a point at a con-

siderable distance; for the trending of the coast from the Cape was more southerly. We also descried rocks and islands to the eastward of the above directions, the most distant of which was about seven leagues from the Cape. Having got off this, we observed the coast to the southward, much indented by points and bays, and, therefore, fully expected to find a good harbour. We soon discovered one behind the Cape, into which we began to ply; but it presently fell calm, and we anchored in 45 fathoms water, as the Discovery also did soon after. Mr. Bligh, the master, was ordered to sound the harbour; who reported it to be safe and commodious.

On Wednesday the 25th, early in the morning, we weighed, and, having wrought into the harbour, anchored in eight fathoms water, bottom a fine dark sand. At two o'clock, P. M. the Discovery got in, when captain Clerke informed us, that he had with difficulty escaped being driven on the S. point of the harbour, his anchor having started before he could shorten the cable. They were, therefore, obliged to set sail, and drag the anchor after them, till they had room to heave it up, when they perceived that one of its palms was broken. Immediately after we had anchored, all the boats were ordered to be hoisted out, and the empty water casks to be got ready. In the mean time captain Cook landed, to search for a convenient spot where they might be filled, and to observe what the place afforded. We found numbers of penguins, seals, and other fowls, on the shore. The seals were not numerous, but so insensible of fear, that we killed as many as we chose, and made use of their fat and blubber to make oil for our lamps, and other purposes. Fresh water was exceedingly plentiful; but not a single tree or shrub was to be discovered, and but little herbage of any kind; though we had flattered ourselves with the hope of meeting with something considerable here, having observed the sides of some of the hills to be covered with a lively green. Before captain Cook returned to the ship, he ascended a ridge of rocks, rising one above another, expecting, by that means, to obtain a view of the country; but before he had reached the top, so thick a fog came on, that it was with difficulty he could find his way down again. Towards the evening we hauled the seine at the head of the harbour, but caught no more than half a dozen small fish; nor had we any better success the next day, when we tried with hook and line. Our only resource, therefore, for fresh provisions, was birds, which were innumerable. On Thursday the 26th, the surf was rather inconvenient for landing, and the weather rather foggy and rainy: nevertheless, we began to cut grafs for our cattle, and to fill water; we found the former near the head of the harbour, and the latter in a brook at the left corner of the beach. The rivulets were swelled to such a degree, by the rain that fell, that the sides of the hills which bounded the harbour, appeared to be covered with a sheet of water: for the rain entered the fissures and crags of the hills, and was precipitated down their sides in prodigious torrents.

The people having laboured hard for two successive days, and nearly completed our water, Captain Cook allowed them the 27th of December as a day of rest to celebrate Christmas. In consequence of which many of them went on shore, and made excursions into the country, which they found desolate in extreme. It contained plenty of water, but no wood; was barren, and without inhabitants; but the shores abounded with fish, and the land with seals, sea-lions, and penguins. In the evening one of them presented a quart bottle to the captain, which was found on the north-side of the harbour, fastened with some wire to a projecting rock. This bottle contained a piece of parchment, with this inscription, "*Ludovico XV. Galliarum rege, et d. (probably a contraction of the word Domino) de Boynes regi a Secretis ad res maritimas annis 1772 et 1773.*" From which it is evident, we were not the first Europeans who had visited this harbour. Captain Cook supposes it to have been left by M. de Bougainville, who went on shore the 13th of February, 1772, the

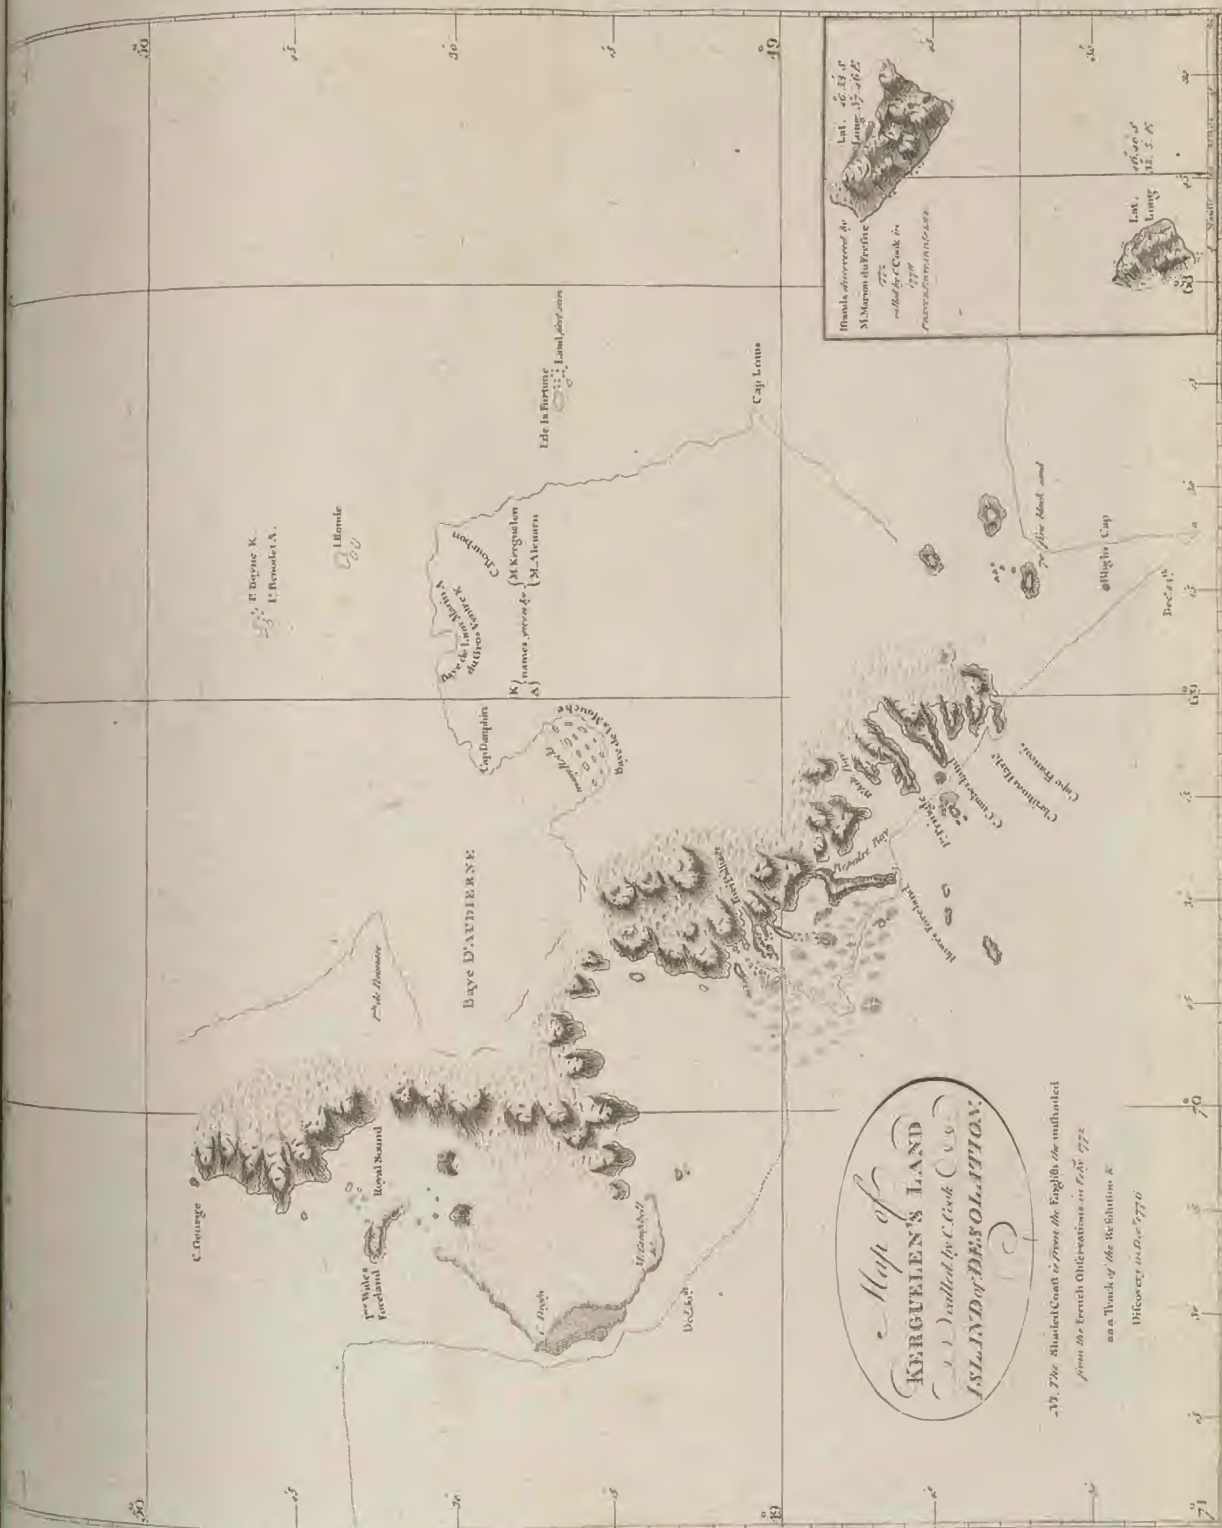

the day that M. de Kerguelen discovered this land; but the captain appears to be for once mistaken; for how could M. de Bougainville, in the beginning of 1772, leave an inscription which commemorates a transaction of the next year? Perhaps the following particulars may throw light upon this part of our author's journal; for we do not in the manner of most of our uninformed cotemporary compilers, servilely copy any one's papers, or, from inattentive indolence, suffer errors to pass uncorrected. M. de Kerguelen, a lieutenant in the French service, had the command of two ships given him, the *La Fortune*, and *Le Gros Ventre*. He sailed from the Mauritius about the latter end of 1771, and on the 13th of January following, discovered the two islands of which we are now speaking, and to which he gave the name of the *Isles of Fortune*. Soon after M. de Kerguelen saw land, as it is said, of a considerable height and extent, upon which he sent one of the officers of his own ship a-head in the cutter to found. But the captain of the other ship, M. de St. Allouarn, in the *Gros Ventre*, found a bay, to which he gave his ship's name, and ordered his yawl to take possession. In the mean time, M. de Kerguelen being driven to leeward, and unable again to recover his station, both boats returned on board the *Gros Ventre*, and the cutter was turned adrift on account of the bad weather. M. Kerguelen returned to the Mauritius, and M. de St. Allouarn continued for three days to take the bearings of this land, and doubled its northern extremity beyond which it trended to the south-eastward. He coasted it for the space of 20 leagues, but finding it high and inaccessible, he shaped his course to New Holland, and from thence returned by the way of Timor and Batavia, to the *Isle of France*, where he died. M. de Kerguelen was afterwards promoted to the command of a 64 gun ship, called the *Rolland*, with the frigate *L'Oiseau*, who were sent out in order to perfect the discovery of this pretended land.

From the accounts of M. Kerguelen's second voyage we learn, that they arrived on the west-side of this island, on the 14th of December, 1783; that, steering to the N. E. they discovered, on the 16th, the *Isle de Reunion*, and other small islands; that, on the 17th, they had before them the principal land, (which they were sure was connected with that seen by them on the 14th,) and a high point of land, named by them *Cape François*; that beyond this cape, the coast took a south-easterly direction, and behind it they found a bay called by them *Baie de L'Oiseau*, from the name of their frigate; that, they then endeavoured to enter it, but were prevented by contrary winds and blowing weather, which drove them off the coast eastward; but that, at last, on the 6th of January, M. de Rosnevet, captain of the *Oiseau*, was able to send his boat on shore in this bay, under the command of M. de Rochegude, one of his officers, "who took possession of that bay, and of all the country, in the name of the king of France, with all the requisite formalities." Hence then we trace, by the most unexceptionable evidence, the history of the bottle and the inscription; the leaving of which was, no doubt, one of the requisite formalities observed by M. de Rochegude on this occasion. And though he did not land till the 6th of January, 1774, yet as Kerguelen's ships arrived upon the coast on the 14th of December, 1773, and had discovered and looked into this very bay on the 17th of that month, it was with the strictest propriety and truth that 1773 and not 1774 was mentioned as the date of the discovery. We may now fairly conclude from the above particulars, that Captain Cook's groundless supposition sprung from want of information, that might enable him to make any other. He had no idea that the French had visited this land a second time; and reduced to the necessity of trying to accommodate what he saw himself, to what little he had heard of their proceedings, he confounds a transaction which we, who have been better informed, know for a certainty, belongs to the second voyage, with a similar one, which his chart of the Southern Hemisphere has recorded, and which happened in a different year, and at a different place.

Nor can a doubt remain, that these islands we now sell in with are the same discovered by Kerguelen: but that M. de Kerguelen ever saw a great country, such as he pretends to have seen, in or near those islands, is very problematical. There are, indeed, numberless islands thinly scattered in this almost boundless ocean; but there are none so superior to those already discovered in riches and cultivation, as to be worth the search, will scarcely admit a question. We now think it time to return to the history of our voyage.

Captain Cook, as a memorial of our having been in this harbour, wrote on the other side of the parchment these words; "*Naves Resolution et Discovery, de Rege Magnæ Britanniæ, Decembris 1776,*" that is, "The ships *Resolution* and *Discovery*, belonging to the king of Great Britain. In the month of December, A. D. 1776." He then put the parchment again into the bottle, accompanied with a silver two-penny piece of 1772, covering its mouth with a leaden cap, and placed it the next morning in a pile of stones, erected for that purpose on an eminence, near the place where it was first found. Here we displayed the British flag, and named the place *Christmas Harbour*, it being on that festival we arrived in it. It is the first inlet we meet with on the S. E. side of *Cape François*, which forms the north side of the harbour, and is the northern point of this land. The situation sufficiently distinguishes it from any of the other inlets; and, which is still more remarkable, its south point terminates in a high rock, perforated quite through, and forming an appearance like the arch of a bridge. If there could be the least doubt remaining of the identity of the *Baie de l'Oiseau*, and *Christmas Harbour*, this particular of the perforated rock, which, in the account of Kerguelen's second voyage, is compared to an arched gateway, would amount to a strict demonstration; and it is very satisfactory to find the two navigators, neither of whom knew any thing of the other's description, adopting the same idea, which both proves, that they had the same uncommon object before their eyes, and that they made an accurate report. The harbour has another mark within, being a single stone or rock, of a vast size, which lies on the top of a hill, on the south-side, near its bottom; and opposite this, on the north side is another hill, smaller, but much like it. At the bottom of this is a small beach where we commonly landed: behind it is some gently rising ground, whereon is a pool of fresh water. On both sides of the inlet, the land is high. The inlet runs in W. and W. N. W. two miles: its breadth, for more than half its length, is one mile and a quarter; above which it is only half a mile. The shores are steep. The depth of water, which is 45 fathoms at the entrance, varies from 30, and if you proceed farther in, to four and five fathoms. The bottom is every where a fine dark sand, except in some places near to the shore, where are beds of seaweed, which always grows on rocky ground. The head of the harbour lies open only to two points of the compass; and even these are covered by islands in the offing, so that no sea can fall in to hurt a ship. Appearances on shore confirmed this; for we found grass growing close to high water mark, which is a sure sign of a pacific harbour. Captain Cook, accompanied by Mr. King, went upon *Cape François*, expecting, from this elevation, to have had a view of the sea-coast, and the islands lying off it: but they found every distant object below them hid in a fog. The land on a level with them, or of a greater height, was visible enough, and appeared exceedingly naked and desolate; except some hills to the southward, which were covered with snow.

We were now busied on board in repairing our rigging, particularly the crew of the *Discovery*, who had suffered much in the frequent squalls, with which she had been harassed ever since her departure from the Cape: at the same time, those who were on shore were no less usefully employed in supplying the ships with water, and the crews with fresh provisions; which last, though not of the most delicate kind, yet to stomachs cloyed almost to loathing with salt provisions,

Three Views of Arched Point on KERGUELEN'S LAND

A View of CHRISTMAS HARBOUR, in KERGUELEN'S LAND, with the manner of killing Penguins, a representation of a Seal, &c.

London: Published by Alon Thompson at the Kings-Arms, No. 1. Peter-noster-Rent.

even seals, penguins and sea-fowl, were not unfavourable. When Christmas was proclaimed, a double quantity of grog was served out to each common man; and a certain proportion of wine and spirits to every petty officer: leave was likewise given to such as were ailing, to go on shore for the benefit of the air; and the officers of both ships reciprocally met in compliment to each other; past dangers were forgotten, and the day was spent by the common sailors with as much mirth and unconcern, as if safely moored in Portsmouth-harbour.

On Sunday the 29th, we sailed, and took leave of this island, which Captain Clerke found by observation to lie in lat. 49 deg. 30 min. S. and in 78 deg. 10 min. E. longitude. We now pursued our course for Van Diemen's land, and having no discoveries in view, took every advantage of the weather to carry sail.

Mr. Anderson, who, during the short time we lay in Christmas Harbour, lost no time nor opportunity for examining the country, in every direction, has favoured us with the following observations. No place (says he) hitherto discovered, in either hemisphere, affords so scanty a field for the naturalist as this barren spot. Some verdure, indeed, appeared, when at a small distance from the shore, which might raise the expectation of meeting with a little herbage; but all this lively appearance was occasioned by one small plant, resembling faxifrage, which grew up the hills in large spreading tufts, or a kind of rotten turf, which, if dried, might serve for fuel, and was the only thing seen here, that could possibly be applied to that purpose. Another plant, which grew to near the height of two feet, was pretty plentifully scattered about the boggy declivities; it had the appearance of a small cabbage when it has shot into seeds. It had the watery acrid taste of the antiscorbutic plants, though it materially differed from the whole tribe. When eaten raw, it was not unlike the New Zealand curvy-grass; but, when boiled, it acquired a rank flavour. At this time, none of its seeds were ripe enough to be brought home, and introduced into our English gardens. Near the brooks and boggy places were found two other small plants, which were eaten as salad; the one like garden cresses, very hot; and the other very mild: the latter is a curiosity, having not only male and female, but also androgynous plants. Some coarse grass grew pretty plentifully in a few small spots near the harbour, which was cut down for our cattle. In short the whole catalogue of plants did not exceed eighteen, including a beautiful species of lichen, and several sorts of moss. Nor was there the appearance of a tree or shrub in the whole country.

Among the animals, the most considerable were seals, which were distinguished by the name of sea-bears; being the sort that are called the urfine seal. They come on shore to repose and breed. At that time they were shedding their hair, and so remarkably tame, that there was no difficulty in killing them. No other quadruped was seen; but a great number of oceanic birds, as ducks, snags, petrels, &c. The ducks were somewhat like a widgeon, both in size and figure: a considerable number of them were killed and eaten: they were excellent food, and had not the least fishy taste. The cape petrel, the small blue one, and the small black one, or Mother Carey's chicken, were not in plenty here; but another sort, which is the largest of the petrels, and called by seamen, Mother Carey's goose, is found in abundance. This petrel is as large as an albatross, and is carnivorous, feeding on the dead carcases of seals, birds, &c. The greatest number of birds here are penguins, which consist of three sorts. The head of the largest is black, the upper part of the body of a leaden grey, the under part white, and the feet black: two broad stripes of fine yellow descend from the head to the breast; the bill is of a reddish colour, and longer than in the other sorts. The second sort is about half the size of the former. It is of a dark grey on the upper part of the body, and has a white spot on the upper part of the head. The bill and feet are yellowish. In the third sort, the upper part of the body and throat are black, the rest white, except the

No. 51.

top of the head, which is ornamented with a fine yellow arch, which it can erect as two crests. The snags here are of two sorts; the lesser corvorant, or water-crow, and another with a blackish back and a white belly. The sea-swallow, the tern, the common sea-gull, and the Port Egmont hen, were also found here. Also large flocks of a singular kind of white bird flew about, having the base of the bill covered with a horny crust. It had a black bill and white feet, was somewhat larger than a pigeon, and the flesh tasted like that of a duck: We hauled the seine once, when we found a few fish about the size of a small haddock. The only shell-fish we saw were a few limpets and muscles.

Many of the hills, notwithstanding they were of a moderate height, were at that time covered with snow, though answering to our June. It is reasonable to imagine that rain must be very frequent here, as well from the marks of large torrents having rushed down, as from the appearance of the country, which even on the hills, was a continued bog or swamp. The rocks consist principally of a dark blue and very hard stone, intermixed with particles of glimmer. Some considerable rocks were also formed here from a brownish brittle stone. These are the remarks of the ingenious Mr. Anderson, Captain Cook's surgeon.

Having sailed out of Christmas Harbour, we steered S. E. along the coast with a fine breeze and clear weather. This was unexpected, as, for some time past, fogs had prevailed more or less every day. Though we kept the line constantly going, we seldom struck ground with a line of 60 fathom. At eight o'clock, A. M. we were off a promontory, which was named Cape Cumberland. It lies a league and a half from the south point of Christmas Harbour; between them is a good bay. Off Cape Cumberland is a small island, on the summit of which is a rock resembling a sentry-box, which name was given to the island on that account. Some small islands and rocks, with broken ground around them, lie two miles farther to the eastward; between which and Sentry-box Island we failed, the breadth of the channel being full a mile. We found no bottom with 40 fathoms line. When through this channel, we saw, on the south side of Cape Cumberland, a bay, running in three leagues to the westward. It is formed by this cape to the north, and by a promontory to the south, which was named Point Pringle, as a compliment from our captain to Sir John Pringle, President of the Royal Society. The bottom of this bay we called Cumberland Bay. The coast, to the southward of Point Pringle, forms a fifth bay, which we called White Bay, wherein are several lesser bays or coves, which seemed to be sheltered from all winds. Off the south point, several rocks raise their heads above water, and probably there are many others that do not. Thus far our course was in a direction parallel to the coast, and not more than two miles from it; and the country had the same sterile and naked aspect as in the neighbourhood of Christmas Harbour. The land which first opened off Cape François, in the direction of south 53 deg. E. we had kept on our larboard-bow, thinking it was an island, with a passage between that and the main; but we found it to be a peninsula, joined to the rest of the coast by a low isthmus. The bay, formed by this peninsula, we called Repulse Bay; and the northern point of the peninsula was named Howe's Foreland, in honour of Lord Howe. Drawing near it we observed some rocks and breakers, not far from the N. W. part, and two islands to the eastward of it, which, at first, appeared as one. We steered between them and the Foreland, and, by noon, were in the middle of the channel. The land of this Foreland or peninsula is of a tolerable height, and of a hilly and rocky substance. The coast is low; almost covered with sea-birds; and we perceived some seals upon the beaches.

Having cleared the rocks and islands before mentioned, we saw the whole sea before us to be chequered with large beds of rock weed, which was fast to the bottom. There is often found a great depth of water upon such shoals, and rocks have, as often, raised

5 O

their

their heads almost to the surface of the water. It is always dangerous to sail over them, especially when there is no surge of the sea to discover the danger. We endeavoured to avoid the rocks, by steering through the winding channels by which they were separated. Though the lead was continually going, we never struck ground with a line of sixty fathoms: this increased the danger, as we could not anchor, however urgent the necessity might be. At length we discovered a lurking rock, in the middle of one of the beds of weeds, and even with the surface of the sea. This was sufficiently alarming, to make us take every precaution to avoid danger. We were now about eight miles to the southward of Howe's Foreland, across the mouth of a large bay; in which were several rocks, low islands and beds of sea weed; but there appeared to be winding channels between them. We were so much embarrassed with these shoals, that we hauled off to the eastward, in hopes of extricating ourselves from our difficulties; but this plunged us into greater, and we found it absolutely necessary to secure the ships, if possible, before night, especially as the weather was hazy, and a fog was apprehended. Observing some inlets to the S. W. captain Clerke was ordered, (the Discovery drawing less water than the Resolution) to lead in for the shore, which was immediately attempted. In standing in we could not avoid running over the edges of some of the shoals, on which was found from 10 to 20 fathoms water; but the moment we were clear of them, we had no ground at the depth of 50 fathoms. Having weathered a spit that run out from an island on our lee, captain Clerke made the signal for having discovered an harbour, in which we anchored in 15 fathoms water, about five o'clock in the evening, near a mile from the shore. The N. point of the harbour bore N. by E. half E. one mile distant, and the small islands in the entrance, within which we anchored, extended from E. to S. E. No sooner were the ships secured, than it began to blow so very strong, that we found it necessary to strike top-gallant yards. The weather, however, continued fair, and it presently became clear, the wind having dispersed the fog that had settled on the hills.

As soon as we had anchored, captain Cook ordered two boats to be hoisted out; in one of which he dispatched Mr. Bligh, the master, to survey the upper part of the harbour, and look out for wood. He also desired captain Clerke to send his master to sound the channel, S. of the small isles, and went himself in his own boat, accompanied by Mr. Gore, our first lieutenant, and Mr. Bailey, and landed on the N. point, to see what discovery could be made from thence. From an hill over the point, they had a view of the sea coast, as far as Howe's Foreland. Several small islands, rocks, and breakers, were scattered along the coast, and there appeared no better channel to get out of the harbour, than that by which they had entered it. While captain Cook and Mr. Bailey were making these observations, Mr. Gore encompassed the hill, and joined them at a place where the boat was attending for them. There was nothing to obstruct their walk, except some craggy precipices; the country being, if possible, more barren, and desolate, than that about Christmas Harbour: and was there the least fertility in any part of this island, we might reasonably expect to have found it in this, which is completely sheltered from the predominating bleak southerly winds. But we could find neither food nor covering for cattle of any sort; and if any had been left, they must inevitably have perished. In the little bay where the boat lay, called by captain Cook Penguin Cove, (from the inexpressible number of those birds appearing there) is a fine fresh river, which we could approach without difficulty. Some large seals, shags, and a few ducks were seen, and Mr. Bailey had a glance of a very small land bird, but it flew among the rocks, and we lost it. At nine o'clock we got on board, and Mr. Bligh returned soon after. He reported, that he had been four miles up the harbour; that its direction was W. S. W. that its breadth near the ships did not exceed a mile; that the soundings were

from 37 to 10 fathoms; and that, having landed on both shores, he found the soil rocky, without a tree or shrub, or hardly any appearance of verdure.

Monday the 30th, both wind and weather favouring us, we weighed anchor, set sail, and put out to sea. To the harbour we had left, the name was given of Port Palliser, in honour of admiral Sir Hugh Palliser. It lies in the lat. of 49 deg. 3 min. S. long. 69 deg. 37 min. E. distant five leagues from Howe's Foreland, and in the direction of S. 25 deg. E. When standing out, we discovered a round hill, like a sugar loaf, in the direction of S. 72 deg. E. distant about 9 leagues; having the appearance of an island, but we afterwards found it was upon the main land. In getting out to sea, in general, we steered through the winding channels among the shoals, though we sometimes ventured to run over them, on which we never found less than 18 fathoms water; nor would they have been discovered, had it not been for the sea weed growing upon them. Having got three or four leagues from the coast, we found a clear sea, and steered E. till nine o'clock A. M. at which time the sugar-loaf hill, above mentioned, which we named Mount Campbell, bore S. E. and a small island, to the northward of it, S. S. E. distant four leagues. We now steered more southerly, in order to get in with the land. At noon we observed in latitude 49 deg. 8 min. S. longitude from Cape François 80 miles E. Mount Campbell bore S. 47 deg. W. distant 4 leagues; and a low point S. E. at the distance of about 20 miles. We were now little more than two leagues from the shore. This part of the coast seems to be what the French saw on the 4th of January 1774. The land, in general, is level. The mountains end about five leagues from the low point, leaving a great extent of low land, whereon mount Campbell is situated. These mountains seemed to be composed of naked rocks, whose summits are covered with snow; and in the valleys sterility only is visible. When we had finished taking our meridian altitudes, we discovered more land, opening off the low point just mentioned, in the direction of S. S. E. and eight miles beyond it. It proved to be the eastern extremity of this land, and we named it Cape Digby. It lies in latitude 49 deg. 23 min. S. and in 70 deg. 34 min. E. longitude. Between Howe's Foreland and Cape Digby, the shore forms one great bay, extending several leagues to the S. W. A prodigious quantity of sea weed grows over it, which seemed to be such as Mr. Banks distinguished by the name of *fucus giganteus*. Though the stem of this weed is not much thicker than a man's thumb, some of it grows to the amazing length of 60 fathoms. Having run two leagues upon a S. E. half E. course, at one o'clock P. M. we founded, and had 18 fathoms water, with a bottom of fine sand. Observing a small bending in the coast, we steered for it, with an intention to anchor there; but being disappointed in our views, we pushed forward, in order to see as much as possible of the coast before night. From Cape Digby it trends nearly S. W. by S. to a low point, which we named Point Charlotte, in honour of the Queen. In the direction of S. S. W. about six leagues from Cape Digby is a pretty high projecting point, which we called the Prince of Wales's Foreland; and six leagues beyond that, in latitude 49 deg. 54 min. S. longitude 70 deg. 13 min. E. is the most southerly point of the whole coast, to which, in honour of his present Majesty, we gave the name of Cape George. Between Point Charlotte, and the Foreland, we discovered a deep inlet, which was named Royal Sound, into which, on the S. W. side of the Prince of Wales's Foreland, we saw another inlet; and it then appeared, that the Foreland was the E. point of a large island lying in the mouth of it. There are several small islands in this inlet; and one about a league to the southward of the above mentioned Foreland. On the S. W. side of the Royal Sound, all the land to Cape George consists of elevated hills, gradually rising from the sea to a considerable height, having their summits caped with snow, and appearing as barren, as those we had hitherto seen. Neither inland, nor on the coast, could we discern the smallest vestige

vestige of a tree or shrub: but some of the low land about Cape Digby, though for the most part desolate, seemed to be clothed with a green turf. On the sandy beaches penguins and other sea fowls were numerous; and shags kept continually flying about the ships. In order to get the length of Cape George, we continued stretching to the S. under all the sail we could carry, till between seven and eight o'clock, when seeing no probability of accomplishing our design, we took advantage of the wind, which had shifted to W. S. W. (the direction, in which we wanted to go) and stood away from the coast. Cape George now bore S. 53 deg. W. distant 7 leagues. We saw no land to the S. of it, except a small island that lies off the pitch of the Cape; and a S. W. swell, which we met when we brought the cape to bear in this direction, confirmed us in the opinion, that there was no more in that quarter. But, to use captain Cook's own words, "We have, says he, still a stronger proof, that no part of this land can extend much, if at all, to the southward of Cape George; and that is, captain Furneaux's track in February 1773, after his separation from me during my late voyage. His log-book is now lying before me; and I find from it, that he crossed the meridian of this land only about 17 leagues to the southward of Cape George; a distance at which it may very well be seen in clear weather. This seems to have been the case when captain Furneaux passed it. For his log-book makes no mention of fogs or hazy weather; on the contrary, it expressly tells us, that, when in this situation, they had it in their power to make observations, both for latitude and longitude, on board his ship; so that, if this land extends farther S. than Cape George, it would have been scarcely possible that he should have passed without seeing it. From these circumstances we are able to determine, within a very few miles, the quantity of latitude that this land occupies, which does not much exceed one degree and a quarter. As to its extent from E. to W. that still remains undecided. We only know, that no part of it can reach so far to the W. as the meridian of 65 deg. because in 1773 I searched for it in vain." But we think it necessary to remark here, that if the French observations, as marked upon captain Cook's chart, and still more authentically upon that published by their own discoverers, may be depended upon, this land doth not reach so far to the W. as the meridian of 68 deg. Cape Louis, which is represented as its most westerly point, being laid down by them to the E. of that meridian.

Thus an idea of a southern continent adopted by M. de Kerguelen, vanished before the accurate researches of captain Cook. Even Kerguelen himself, in consequence of these, thinks very differently. This appears from an explicit declaration of his sentiments, in his late publication, which does equal honour to his candour and to captain Cook's abilities. It must be confessed M. de Kerguelen was peculiarly unfortunate, in having done so little to complete what he had begun. He discovered, it is true, a new land; but, in two expeditions to it, he could not once bring his ships to an anchor upon any part of its coasts: we cannot but conclude, therefore, that our brave commander had either fewer difficulties to struggle with, or was more successful in surmounting them. The French discoverers imagined Cape François to be the projecting point of a southern continent. The English have discovered that no such continent exists, and that the land in question is an island of small extent; which, from its sterility, might properly be called the island of Desolation; but captain Cook was unwilling to rob Monsieur de Kerguelen of the honour of its bearing his name. Which is more than can be said of his own countrymen: for even M. de Pages never once mentions the name of his commander. And, though he takes occasion to enumerate the several French explorers of the southern hemisphere, from Gonneville down to Crozet, he affects to preserve an entire silence about Kerguelen, whose first voyage, in which the discovery of this considerable tract of land was made, is kept as much out of sight, as if it had never taken place. Nay, not satisfied with refusing to

acknowledge the right of another, he almost assumes it to himself. For upon a map of the world, annexed to his book, at the spot where the new land is delineated, he tells us, that it was seen by M. de Pages, in 1774. He could scarcely have expressed himself in stronger terms, if he had meant to convey an idea, that he was the conductor of the discovery. And yet we know, that he was only a lieutenant, on board one of the ships commanded by Kerguelen; and that the discovery had been made in a former voyage, undertaken while he was actually engaged in his singular journey round the world. We now take leave of Kerguelen's land; and captain Cook, pursuant to his instructions, intended to proceed next to New Zealand, to take in wood and water, and provide hay for the cattle; their number by this time having been considerably diminished; for while exploring Kerguelen's desolate land, we lost by death two young bulls, one of the heifers, two rams, and several of the goats. On Tuesday, the 31st in the morning, by observations of the sun and moon, we found our longitude to be 72 deg. 33 min. 36 sec. E. and by these observations we were assured no material errors occasioned by our time-keeper, had crept into our reckoning.

A. D. 1777. On Wednesday the 1st of January, we were in latitude 48 deg. 41 min. S. longitude 76 deg. 50 min. E. when we observed quantities of sea weed passing to leeward, in a direction contrary to that we had seen in approaching the last mentioned islands, which gave reason to suppose, there were other lands at no great distance, and affords some ground for believing, that M. de Kerguelen might have seen other lands in this latitude. On the 3d, in latitude 48 deg. 16 min. S. longitude 85 deg. E. we had the weather tolerably clear, with fresh gales from the W. and S. W. but now the wind veered to the N. and continued in that quarter eight days, during which, though there was at the same time a thick fog, we run upwards of 300 leagues, chiefly in the dark: the sun, indeed, sometimes made its appearance, but very rarely, and but for a very short time. On the 7th, a boat was dispatched with orders to captain Clerke, fixing our rendezvous at Adventure Bay, in Van Diemen's land, should the two ships happen to separate before they arrived there; however, we had the good fortune not to lose company with each other. On Sunday the 12th, the northerly winds were succeeded by a calm, which was soon followed by a southerly wind. Our latitude was now 48 deg. 40 min. S. longitude 110 deg. 26 min. E. The wind blew from the S. for 24 hours, and then veering to the W. and N. W. brought on clear and fair weather. We continued our course eastward, and on Tuesday the 14th, a hurricane arose, accompanied with so thick a fog, that the ships were every moment in danger of falling foul one of the other. We kept the fog bell constantly ringing, and guns firing, which were answered by the Discovery. On Sunday the 19th, a sudden squall carried away our fore-top-mast, and main-top-gallant-mast, which took us up the whole day to clear the wreck, and to fit another top-mast. Not having a spare main-top-gallant-mast on board, the fore-top-gallant-mast was converted into one for our immediate use. On the 20th, the weather brightened up, the wind continued westerly, and we had a brisk but moderate gale in the afternoon, when we set all the sails we could, unreefed our top-sails, and run at the rate of seven and eight miles an hour by the log, both ships in company. On the 22d Mr. King went on board the Discovery to compare the time-pieces. At this time our company were in perfect health, those of the crew only excepted, who had been hurt at the cape, and even they were fit to do duty. The damages we had received during the blowing weather were not so considerable as might have been expected.

On Friday the 24th, at three o'clock, A. M. we discovered the coast of Van Diemen's land, bearing N. W. half W. The Mewstone so named by captain Furneaux, in 1773, bore N. E. by E. distant 3 leagues. We made the signal for seeing land, which was answered by the Discovery. Several islands and high rocks

rocks are strewn along this part of the coast, the southernmost of which is Mewstone, a round elevated rock, five or six leagues distant from the S. W. cape, in the direction of S. 55 deg. E. Our latitude, at noon, 43 deg. 47 min. S. longitude 147 deg. E. in which situation a round topped hill bore N. 17 deg. W. the S. W. cape N. 74 deg. W. the Mewstone W. half N. Swilly isle or Rock S. 49 deg. E. and the S. E. or S. Cape, N. 40 deg. E. distant near 3 leagues. The land between the S. W. and the South Capes is broken and hilly, the coast winding, with points shooting out from it; but we were at too great a distance, to be able to judge whether the bays formed by these points were sheltered from the sea winds. The bay which appeared to be the largest and deepest, lies to the westward of the elevated peaked hill above mentioned. On the 25th, at six o'clock A. M. we founded and found ground at 60 fathoms, sand and shelly bottom. The South Cape then bore N. 75 deg. W. two leagues distant: Tasman's head N. E. and Swilly rock S. by W. half W. To a rock, on account of its striking resemblance to Eddystone light-house, captain Cook gave the name of the Eddystone; this, which had not been noticed by captain Furneaux, lies about a league to the eastward of Swilly Rock. Nature seems to have left these two rocks here, for the same purpose that the light house was erected by man, namely, to remind navigators of the dangers that surround them; for they may be seen, even in the night, at a considerable distance; their surface being white with the dung of sea fowls. They are the summits of a ledge of rocks under water, whereon the sea breaks, in many places, very high. On the N. E. side of Storm Bay, which lies between the South Cape and Tasman's Head, are some creeks, pretty well sheltered; and if this coast was carefully examined, some good harbours would most probably be found. Soon after we had sight of land the westerly winds left us, and were succeeded by light airs, and alternate calms; but,

Sunday the 26th at noon, a breeze sprung up at S. E. which afforded captain Cook an opportunity of executing his design of carrying the ships into Adventure Bay, where we expected to procure a fresh supply of wood and grass; of both which articles we should have been in great want, had we waited till our arrival in New Zealand. We therefore stood for the bay; wherein we came to an anchor, at four o'clock, P. M. in 12 fathoms water, not quite a mile from the shore. No sooner were the ships properly secured, than the pinnace was ordered to be launched, the boats to be manned, and all hands set to work to overhaul the rigging, and get every thing in readiness to continue our course. The officers, astronomers, and gentlemen, on board both ships, eagerly embraced the opportunity of going ashore to take a view of the country, with which all on board were highly pleased. The first thing that attracted our notice were the trees, that by their magnitude and loftiness exceeded every thing we had ever seen of the kind: but what was remarkable, we found many of them burnt near the ground, and not a few lying in a horizontal position, which, being much scorched, had been thrown down by the violence of the wind. The captains Cook and Clerke went, in separate boats, in search of convenient spots for wooding and watering, and making hay. They found plenty of wood and water, but very little grass.

Monday the 27th, lieutenant King was dispatched to the E. side of the bay, with two parties, under the protection of some marines; one to cut wood, and the other to cut grass. For although, as yet, none of the natives had appeared, there could be no doubt that some were in the neighbourhood, as we had perceived columns of smoke, from the time of our approaching the coast; and some now were observed, at no great distance, up in the woods. The launch was likewise sent for water; and in the evening having drawn the seine, we caught, at one haul, a great quantity of fish; most of which were of that sort, known to seamen by the name of elephant fish. The Captain this day visited all the parties that had been sent ashore; and she

next the 28th, accompanied by several gentlemen, and guarded by a party of marines, he made a second excursion into the country, in order to make discoveries, and to procure, if possible, an interview with some of the inhabitants. They penetrated some miles through paths that seemed to have been frequented, before they could get sight of any human being, till, at length, passing by the edge of an almost impenetrable thicket, they heard a rustling, which, at first, they mistook for the rustling of a wild beast; but searching closely, they found a girl quite naked and alone. At first she seemed much terrified; but being kindly treated, and her apprehensions of death removed, she became docile, and ready to answer every thing we questioned her concerning her residence, which we did by pointing to every beaten path, walking a little way in it, and then returning and taking another, making motions to her, at the same time, to lead us along, and we would follow her. To make her perfectly easy, one of our company pulled off his handkerchief, and put it about her neck by way of ornament, and another covered her head with his cap, and then she was dismissed. She ran among the bushes, and, in less than an hour, eight men and a boy made their appearance. They approached us without betraying any marks of fear, or rather with the greatest confidence imaginable; none of them having any weapons, except one, who held in his hand a stick about two feet long, and pointed at one end. They were quite naked, and wore no ornaments, unless we consider as such, some large punctures in different parts of their bodies, some in straight, and others in curved lines. The men were of the middle stature, but rather slender. Their skin and hair were black; and the latter as woolly as that of any native of Guinea; but they were not distinguished by remarkable thick lips, nor flat noses. On the contrary, their features were far from being disagreeable. They had pretty good eyes; and their teeth were tolerable even, but very dirty. Most of them had their hair and beards matted with a red ointment, and some had also their faces painted with the same composition. These were all kindly treated by our company: but they received every present we made them, without any apparent satisfaction. When some bread was offered them, as soon as they understood it was to be eaten, they either returned, or threw it away, without tasting it. Some elephant fish, both raw, and dressed, they likewise refused; but some birds, we gave them, these they did not return, and easily made us comprehend that they were fond of such food. Two pigs having been brought on shore, to be left in the woods, they seized them by the ears, and seemed inclined to carry them off, with an intention, as we supposed, of killing them. Captain Cook, wishing to know the use of the stick which one of our visitors held in his hand, made signs expressing his desire to be gratified in this particular: upon which one of them took aim at a piece of wood set up at the distance of twenty yards; but after several essays he was still wide of the mark. Omiah, to shew the great superiority of our weapons, immediately fired his musquet at it, the report of which so alarmed them, that they took flight, and vanished in an instant. On our return we found they had been at the place at which the crew of the Discovery were watering; and an officer of that party firing also a musquet in the air, they ran into the woods with uncommon precipitation. Soon after these had fled from us with uncommon speed, the girl we had first seen returned, and with her came several women, some with children on their backs, and some without children. The former wore a kangaroo skin fastened over their shoulders, the only use of which seemed to be, to support their children on their backs, for it left those parts uncovered which modestly directs us to conceal. Their bodies were black, and marked with scars like those of the men; from whom, however, they differed, in having their heads shaved; some of them being completely shorn, others only on one side, while the rest of them had the upper part of their heads shaved, leaving a very narrow circle of hair all round. They were far

from being handsome; however, some of our gentlemen paid their addresses to them, but without effect. These were also kindly received, and conducted to the place where the wooders were at work, with whom it was not long before they were acquainted. They were, however, miserable objects; and Omiah, though led by natural impulse to an inordinate desire for women, was so disgusted with them, that he fired his piece off to frighten them from his sight, which for that time had the desired effect. That the gallantry of some of our people was not very agreeable to the men, is certain; for an elderly man as soon as he observed it, ordered the women and children to retire, which they all did, but some with a little reluctance. When the several parties of our visitors had fled, and retired, captain Cook ordered the two pigs, one male and the other female, to be carried about a mile within the woods, and he himself saw them left there, taking care that none of the natives should observe what was passing. He also intended to have left a young bull and a cow, besides some goats and sheep; but he soon relinquished that design, being of opinion the natives would destroy them; which he supposed would be the fate of the pigs, if they should chance to find them out: but as swine soon become wild, and are fond of being in the woods, it is probable that they were preserved. The other cattle could not have remained long concealed from the natives, as they must have been put in an open place.

Wednesday the 29th, we were prevented from sailing by a dead calm, which continued the whole day. Parties were therefore sent on shore to cut wood and grass, as usual; and Captain Cook accompanied the wood-cutters himself. At the same time our gentlemen, with Lieutenant King, and other officers belonging to both ships, extended their excursions still farther into the country, and found it beautifully diversified with hills and vallies, stately groves of trees, rivers, meadows, and lawns of vast extent, with thickets full of birds of the most beautiful plumage, and of various notes, whose melody was truly enchanting. Here were lagoons full of ducks, teal, and other wild fowl, of which great numbers were shot; while our naturalists were loading themselves with the spontaneous productions of the soil; a soil we may venture to say, the richest and most fertile of any in the habitable globe, the trees growing to an astonishing height and size, not less beautiful to the eye than grateful to the sense of smelling. It was now the time when nature pours forth her luxuriant exuberance to cloath this country with a rich variety; but, what appeared strange to every observer, the few natives we saw were wholly insensible of those blessings, and seemed to live like the beasts of the forest in roving parties, without arts of any kind, sleeping in summer like dogs, under the hollow sides of the trees, or in the wattled huts made with the low branches of ever-green shrubs, stuck in the ground at small distances from each other, and meeting together at the top.

We had, in the morning, observed several of the natives sauntering along the shore, from which we concluded, that, though their consternation had made them leave us rather abruptly the preceding day, they thought we intended them no mischief, and were desirous of renewing the intercourse. Of this we were soon convinced; for we had not been long landed before twenty of them, men and boys, joined us, without expressing the least sign of fear or distrust; one of whom was distinguished not only by his deformity, but by the drollery of his gesticulations, and the seeming humour of his speeches, though we could only guess at their general import, the language spoken here being wholly unintelligible to us. Our Commander thought this to be different from that spoken by the inhabitants of the more northern parts of this country, whom he met with in his first voyage; which is not extraordinary, since those we now saw, and those we then visited, differ in several respects: particularly with regard to the texture of their hair. The natives whom the Captain met with at Endeavour River in 1769, are

No. 52.

said, by him, "to have naturally long and black hair, though it be universally cropped short. In general it is strait; but sometimes it has a slight curl. We saw none that was not matted and filthy. Their beards were of the same colour with the hair, and bushy and thick." At this time Captain Cook was unwilling to allow that the hair of the natives we now saw in Adventure Bay was woolly, fancying that his people, who first observed this, had been deceived, from its being clotted with grease and red ochre. But Lieutenant King prevailed on him afterwards, to examine carefully the hair of the boys, which was generally, as well as that of the women, free from this dirt; and then the captain owned himself satisfied, that it was naturally woolly. Perhaps this circumstance was the occasion of his being deceived, when he was in Endeavour River, for he says expressly, "they saw none that was not matted and filthy." Some of our present visitors had a slip of kangaroo skin round their ankles; and others wore round their necks three or four folds of small cord, made of the fur of some animal. They seemed not to value iron, but were apparently pleased with the medals and strings of beads that were given them. They did not seem even to know the use of fish-hooks, though it is more than probable, that they were acquainted with some method of catching fish, which would naturally be adopted by those who inhabit a sea-coast, and who derive no part of their sustenance from the productions of the ground. They rejected the sort of fish we offered them, yet it was evident, that shell-fish, at least, made a part of their food, from the heaps of muscle-shells we saw near the shore, and about the usual places of their resort. Their wigwags, or habitations, were small hovels or sheds, built of sticks, and covered with the bark of a tree. We had good reason to suppose, that they sometimes took up their residence in the trunks of large trees, hollowed out by fire. In or near their huts, and wherever there was a heap of shells, there we perceived the remains of fire; an indubitable proof that they do not eat their food raw. Nor do they seem such miserable wretches, as the natives whom Dampier mentions to have seen on its western coast. Yet, we must here observe, that Dampier's miserable wretches, on the western coast of New Holland, in many instances, bear a striking resemblance to those seen by Captain Cook at Van Diemen's Land: as (1st.) Their soon becoming familiar with strangers. (2nd.) As to their persons; being straight of stature and thin; their skin thick and black; their hair black, short, and curled, like those of the negroes of Guinea; with wide mouths. (3dly.) As to their mean condition; having no houses, no garments, no canoes, no instrument to catch large fish; feeding on broiled muscles, cockles, and periwinkles; having no fruits of the earth; their weapons a straight pole, sharpened and hardened at the end, &c. But the chief peculiarities of Dampier's New Hollanders, on account of which they are improperly called miserable wretches, are, (1st.) Their eye-lids being always half closed, to keep the flies out, which were exceedingly troublesome there; and (2ndly.) Their wanting the two fore-teeth of the upper jaw, and having no beards.

When the party with Lieutenant King, with whom was Mr. Anderson, Captain Cook's surgeon, had landed, the natives appeared divested of their fears, and issued from the thickets like herds of deer from a forest. They were armed with lances about two feet long, terminated with a shark's tooth or piece of bone sharpened to a point, which they threw to a great distance, and these were the whole of their armour. Some women and children were introduced to Mr. King, to whom he gave presents of such trifles as he had about him. He also offered all of them nails, knives, beads, and other toys, to which they paid little or no attention, but were greedy after shreds of red cloth. Mr. Anderson having, with his usual diligence, spent the few days we continued in Adventure Bay, in examining the natural productions of the country and its inhabitants, we shall here insert the substance of his remarks; and we doubt not but that the observations of this ingenious

genious gentleman, will, by the curious part of our readers, always be thought worth attending to. There is, observes Mr. Anderson, a beautiful sandy beach, about two miles long, at the bottom of Adventure Bay, formed, to all appearance, by the particles which the sea washes from a white sand stone, that in many places bounds the shore. This beach, about two miles long, is well adapted for hauling the seine. Behind it is a plain, with a brackish lake, out of which we caught, by angling, some whitish bream, and small trout. The parts adjoining the bay are mostly hilly; and both these and the flat are adorned with one continued forest of tall trees, rendered almost impassable to strangers, by breaks of fern, shrubs, and fallen trees: but on the sides of some of the hills, where the trees are thin, the only interruption is a coarse grass. Northward of the bay is low land, stretching farther than the eye can reach, covered only with wood in certain spots; but an opportunity was not afforded us of examining in what peculiarities it differed from the hilly country. The soil on the flat land, and on the lower part of the hills is sandy, or consists of a yellowish earth, and in some parts of a reddish clay; but farther up the hills, it is of a grey tough cast, and appeared to be very poor. Between the hills, the water drains down from their sides, forming at last small brooks, sufficient to supply us with water: yet, upon the whole, this country bears many marks of being dry; and, setting aside its wood, might be compared to Africa, about the Cape of Good Hope, (though that lies 10 degrees farther northward) rather than to New Zealand, on its other side, in the same latitude, where every valley, however small, is furnished with a considerable stream of water. We found the heat here excessive; inasmuch, that birds were seldom killed an hour or two, before they were almost covered with maggots. No mineral bodies, nor stones of any other kind than the white sand stone, were observed by us; nor could we find any vegetables that afforded the smallest subsistence for men. The forest trees are all of one kind, and generally straight; branching but little till towards the top. The bark is white, which makes them appear at a distance, as if they had been peeled. The leaves of this tree are long, narrow, and pointed; and it bears clusters of white small flowers, whose cups were, at this time, plentifully scattered about the ground, with another sort resembling them somewhat in shape, but much larger; which makes it probable that there are two species of this tree. The bark of the smaller branches, fruit, and leaves, have an agreeable pungent taste, and aromatic smell, not unlike peppermint. The next tree observed was a small one, about 10 feet high, branching pretty much, with narrow leaves, and a large, yellow, cylindrical flower, consisting only of a vast number of filaments; which, being shed, leave a fruit like a pine-top. Both these trees are unknown in Europe. Of plants, by no means numerous, we found a species of gladiolus, rush, bell-flower, samphire, wood-forrel, milk-wort, cud-weed, Job's tears, mosses, and several kinds of fern; but the species are either common, or, at least, found in some other countries, particularly New Zealand. The only quadruped we saw distinctly was a species of opussum, about twice the size of a large rat; of a dusky colour above, tinged with a brown or rusty cast, and whitish below. About the third of the tail, towards its tip, is white, and bare underneath; by which it probably hangs on the branches of trees, as it climbs these, and lives on berries. The kangaroo, found further northward in New Holland, may also be supposed to inhabit here, as some of the natives had pieces of the skin of that animal. From the dung we saw almost every where, and from the narrow tracks perceived among the shrubbery, it should seem also, that they are in considerable numbers. The principal sorts of birds are brown hawks or eagles, crows, large pigeons, yellowish paroquets, and a species which we called motacilla cyanea, from the beautiful azure colour of its neck and head. On the shore were several gulls, black oyster-catchers, or sea-pies, and plovers of a stone colour. These birds are all so scarce and shy, that they must have been

harrassed by the natives, who, perhaps, obtain much of their subsistence from them. About the lake behind the beach, a few wild ducks were seen, and some flags used to perch upon the high leafless trees near the shore. We observed in the woods some blackish snakes; and we killed an unknown large lizard, 15 inches long, and six round, beautifully clouded with black and yellow. The sea affords a much greater plenty, and, at least, as great a variety as the land. Among a variety of fish we caught rays, nurses, leather jackets, bream, soles, flounders, gurnards, small spotted mullets, a little fish with a silver band on its side, and elephant fishes, which last are the most numerous, and, though inferior to many others, are very palatable food. The next in number, and superior in goodness, is a sort none of us recollected to have seen before. It partakes of the nature both of a round and flat fish, having the eyes placed very near each other, the fore part of the body much flattened or depressed, and the rest rounded. It is of a brownish sandy colour, with rusty spots on the upper part, and whitish below. From the quantity of slime it was always covered with, it seems to live after the manner of flat fish, at the bottom. On the rocks are plenty of muscles, and other small shell-fish: also great numbers of sea-stars, small limpets, and large quantities of sponge, one sort of which, that is thrown on the sea-shore, but not very common, has a most delicate texture. Upon the beach were found many pretty Medusa's-heads; and the stinking sea-hare, which, as mentioned by some authors, has the property of taking off the hair by the acrimony of its juice; but the sort we examined, was deficient in this respect. The insects, though few, are here in considerable variety; such as grass-hoppers, butterflies, and several sorts of moths, finely variegated. Here are two sorts of dragon-flies, gad, and camel-flies; several sorts of spiders; and some scorpions; the last are rare. But the most troublesome, though less numerous tribe of insects, are the musquitoes; and a large black ant, the pain of whose bite is almost intolerable, during the short time it lasts.

The inhabitants, with whom we were conversant, seemed mild and cheerful, with little of that savage appearance, common to people in their situation: nor did they discover the least reserve, or jealousy, in their intercourse with strangers. With respect to personal activity or genius, they discovered little of either: as to the last, they have, to appearance, less than the half-animated natives of Terra del Fuego, who have not invention sufficient to make cloathing for defending themselves from the rigour of their climate, though furnished with materials. They display, however, some contrivance, in the manner of cutting their arms and bodies in lines of different directions, raised above the surface of the skin. Their indifference for our presents, their general inattention, and want of curiosity, were very remarkable, and testified no acuteness of understanding. Their complexion is a dull black, which they sometimes heighten, as we supposed, by smutting their bodies; for a mark was left behind on any clean substance, when they handled it. Their hair is perfectly woolly, and is clotted with grease and red ochre, like that of the Hottentots. Their noses, though not flat, are broad and full, as is the case with most Indians; and the lower part of the face projects considerably. Their eyes are of a moderate size, and though not very quick or piercing, they give the countenance a frank, cheerful, and pleasing cast. Their teeth are broad, but not equal, nor well set; and either from nature, or from dirt, not of so clear a white as is usual among people of a black colour. Their mouths are rather wide; but this appearance may be heightened, by wearing their beards long, and clotted with paint, in the same manner as the hair on their heads. Upon the whole, they are well proportioned, though the belly is rather protuberant. Their favourite attitude is to stand with one side forward, and one hand grasping across the back, the opposite arm, which, on this occasion, hangs down by the side that projects. What the poets tell us of Fawns and Satyrs dwelling in woods and

A Young SEA OTTER found off the NORTH WEST COAST of AMERICA.

An OPOSSUM, a Quadruped of VAN DIEMEN'S LAND.

A WHITE BEAR found in the PACIFIC OCEAN near ICY CAPE.

Taylor sculp.

and hollow trees, is here realized. Near the shore in the bay we saw some wretched constructions of sticks, covered with bark, which like the wigwams of the Indians, seemed to have been only temporary abodes. Many of their largest trees were converted into more durable habitations. The trunks of these were hollowed out, to the height of six or seven feet, by means of fire. That they sometimes dwell in them, was evident, from their having hearths in the middle made of clay, round which four or five persons might sit. These places of shelter are permanent; for they leave one side of the tree sound, so that it continues growing with great luxuriance. It does not appear that these people are cannibals, or, indeed, that they feed upon flesh, as no appearance of any such food could be traced among them. Fish, fruit, and the natural productions of the earth, were the only articles of food, that we saw about their fire-places; but, what was still more strange, there was neither canoe nor boat to be seen, though the country abounds with such excellent trees. One might be apt to think, that these natives are a sort of fugitives, who have been driven to subsist here in a state of banishment: but that they originate from the same stock with those who inhabit the northern parts of New Holland is highly probable: and though they differ in many respects, their dissimilarity may be reasonably accounted for, from the united considerations of distance of place, length of time, total separation, and diversity of climate. These will account for greater differences, both as to the persons, and as to the customs of different people, than really exist between our Van Diemen's land natives, and those described by Dampier, and in captain Cook's first voyage. This is certain, that the figure of one of those seen in Endeavour river, and represented in a journal of that voyage, (now before us) very much resembles our visitors in Adventure Bay. That there is not the like resemblance in their languages, is a circumstance that need not create any difficulty: for though the agreement of languages of people living distant from each other, may be assumed as a strong argument for their having sprung from one common source, disagreement of language is by no means a proof of the contrary; and we must have a more intimate acquaintance with the languages spoken here, and in the more northern part of New Holland, before we can be warranted to pronounce that they are totally different. Nay, we have good grounds for the contrary opinion; for we found, that the animal called kangaroo, at Endeavour river, was known under the same name here; and we need not observe, that it is scarcely possible to suppose that this was not transmitted from one another, but accidentally adopted by two nations, differing in language and extraction. Besides, as it seems very improbable, that the inhabitants of Van Diemen's land should ever have lost the use of canoes or sailing vessels, if they had been originally conveyed hither by sea, we must necessarily admit that they, as well as the kangaroo itself, have been stragglers by land from the more northern parts of the country. If there is any weight in this remark of Mr. Anderson's, it will, while it traces the origin of the people, at the same time, serve to fix another point, (if captain Cook and captain Furneaux have not decided it already) namely, that New Holland is no where totally divided from the sea into islands; and Dampier, we find, was of this opinion. As the inhabitants of New Holland seem all to be of the same extraction, there is nothing peculiar in any of them: on the contrary, they much resemble many of the savages whom we have seen in the islands of Tanna and Manicoula. There is even some reason for supposing, that they may originally have come from the same place with all the natives of the Pacific Ocean; for of about ten words we found means to get from them, that which is used to express cold, is very similar to that of New Zealand and Otaheite; the first, or Van Diemen's land, being *mallareede*, the second *makka'reede*, and the third *mar'reede*. Upon a diligent enquiry, and an accurate comparison drawn from the affinity of languages, concludes our curious observer, it will probably be found, that all the people

from New Holland, eastward to Easter island, have been derived from the same common root. The sentiments of our surgeon, on this subject, are conformable to, and coincide with those of Mr. Marsden, in his history of Sumatra, who observes, "That one general language prevailed, (however mutilated and changed in the course of time,) throughout all this portion of the world, from Madagascar to the most distant discoveries eastward; of which the Malay is a dialect, much corrupted or refined by a mixture of tongues. This very extensive similarity of language indicates a common origin of the inhabitants; but the circumstances and progress of their separation are wrapped in the darkest veil of obscurity."

In the afternoon captain Cook went again on shore, and found the grass cutters on Penguin island, where they had met with a plentiful crop of excellent grass. We laboured hard till the evening, and then having provided a sufficient quantity of what was most wanted, returned on board. In the course of this day captain Cook presented many of the natives with medals, inscribed with the names of the ships and the commanders, with the date of the year, and that of his Majesty's reign, in order to perpetuate the memory of this voyage, provided any future European adventurer, prompted by curiosity, should think fit to revisit these remote parts of the southern hemisphere. During our continuance on this coast, all hands were employed in wooding, watering, over-hauling the rigging, and getting every thing in readiness to continue our voyage; and having had either light airs from the E. or calms, little or no time was probably lost by our staying here a few days. Our fishermen also were no less successful in fishing, during our stay, than our fowlers in shooting wild fowl; inasmuch, that nothing was wanting to make our living here delicious.

This land was discovered in November 1642, by Tasman, who gave it the name of Van Diemen's Land. Captain Furneaux touched at it in March 1773. It is the southern point of New Holland, which is by far the largest island in the known world, and might well be taken for, though it does not deserve the name of, a continent. The land is diversified with hills and valleys, and is well wooded. Here is likewise plenty of water. The best, or what is most convenient for shipping, is a rivulet, which is one of several that fall into a small lake, or pond, that lies behind the beach at the head of the bay. It there mixes with the sea water; so that it must be taken up above this pond, which may be done without any great trouble. The bay upon the whole may be considered as a safe road; for the only wind to which it is exposed is the N. E. and as this blows from Maria's islands, it can bring no very great sea along with it. The bottom is clean, good holding ground; and the depth of water from 12 to 4 fathoms. The longitude of Adventure Bay was determined by a great number of lunar observations, and was found to be 147 deg. 29 min. E. Its latitude is 43 deg. 21 min. 20 sec. S. We shall conclude the history of this day, the 29th of January, with a remark of captain Cook's, respecting the conduct of Europeans amongst Savages to their women, which the Captain thinks, "is highly blameable; as it creates a jealousy in their men, that may be attended with consequences fatal to the success of the common enterprise, and to the whole body of adventurers, without advancing the private purpose of the individual, or enabling him to gain the object of his wishes. I believe it has been generally found among uncivilized people, that where the women are easy of access, the men are the first to offer them to strangers; and that, where this is not the case, neither the allurements of presents, nor the opportunity of privacy, will be likely to have the desired effect. This observation, I am sure, will hold good, throughout all the parts of the South Sea where I have been. Why then should men act so absurd a part, as to risk their own safety, and that of all their companions, in pursuit of a gratification which they have no probability of obtaining;" and, which if obtained, we may add, is not only breaking a divine command, but contrary to an indispensable obligation,

gation, of doing as we wish, in like circumstances, to be done unto.

On the 30th, having got plenty of wood and water on board, and whatever else the country afforded, the signal was made for unmooring; and, a light westerly breeze springing up, at eight o'clock A. M. we weighed anchor, and took our departure from Adventure Bay. By ten we had put to sea, and both ships were under sail; soon after which, the wind became southerly and produced a perfect storm; but veering in the evening to the E. and N. E. its fury began to abate. This gale

was attended with an almost intolerable heat, which, however, was of so short a continuance, that some of the 6th and 7th of February, a marine belonging to the *Discovery* fell over-board, and was drowned, which was the second misfortune of the kind her crew had experienced since her departure from England. We held on our direct course for New Zealand; and on Monday, the 10th, we descried Rock's Point, which bore S. E. by S. about eight or nine leagues distant: upon which we steered for Cape Farewell and Stephens's Island.

C H A P. III.

The Resolution and Discovery, having arrived at New Zealand, anchor in their old station in Queen Charlotte's Sound.—Transactions there, and intercourse with the New Zealanders.—Information gained from the natives with regard to the massacre of the Adventure's boat's-crew.—Two violent storms.—An account of Kahoora, who headed the party that killed our people.—Two youths embark on board the Resolution to attend Omiah.—Historical, critical, and nautical observations.—The adjacent country of Queen Charlotte's Sound described.—The soil, plants, animals, &c.—A description of the persons and customs of the inhabitants.—Their dress, ornaments, buildings, arts, canoes, boats, weapons, &c.—Their horrid cruelty to their enemies, when prisoners, whose bodies they mangle and eat.—Extract from a vocabulary of their language.

HAVING made the land of New Zealand, we steered for Cape Farewell, which, on Tuesday the 11th, at day-break, bore S. by W. distant about 4 leagues. In rounding the cape we had fifty fathoms water over a sandy bottom. At nine o'clock P. M. we came up with Stephens's island, and by ten, the next morning, being the 12th, we cast anchor, and took our station in Ship Cove, Queen Charlotte's Sound. In the afternoon we landed a number of empty water casks, and cleared a place for two observatories. We likewise set up tents for the guard, and of such of our people, whose business might make it necessary for them to remain on shore. In the mean time several canoes, filled with natives, came along side of the ships; but very few of those who were in them would venture aboard. This appeared the more extraordinary, as captain Cook was well known to them all: one, in particular, had been treated by him with distinguished kindness, during his stay here in a former voyage: yet now, neither professions of friendship, nor presents, could prevail upon this man to come into the ship. We could only account for this reserve by supposing, that we had revisited their country, in order to revenge the death of captain Furneaux's people, who had been killed here. But upon captain Cook's assuring them of the continuance of his friendship, and that he should not molest them on that account, they soon laid aside all appearance of suspicion and distrust. On Thursday the 13th, we pitched two tents, one for each ship, on the same spot where we had formerly erected them. We also set up the observatories, in which Messrs. King and Bailey immediately commenced their astronomical operations. Two of our men were employed in brewing spruce beer; while others filled the water casks, collected grass for the cattle, and cut wood. Those who remained on board were occupied in repairing the rigging, and performing the necessary duties of the ships. A guard of marines was appointed for the protection of the different parties on shore, and arms were given to the workmen, to repel all attacks from the natives, if they had been inclined to molest us; but this did not appear to be the case: for during the course of this day, a great number of families came from different parts of the coast, and took up their residence close by us; so there was not a spot in the cove where a hut could be put up, that was not occupied by them, except the place where we had fixed our little encampment. The facility with which they build their temporary habitations, is very remarkable. They have been seen to erect more than twenty of them on a spot of ground, that, not an hour before, was covered with shrubs and plants. They generally bring some part of the materials with them; the rest they find upon the premises. Our Captain was present

when a number of people landed, and built one of their villages. The canoes had no sooner reached the shore, than the men leaped out, and took possession of a piece of ground, by tearing up the plants and shrubs, or sticking up some part of the framing of a hut. They then returned to their canoes, and secured their weapons, by setting them up against a tree, or placing them in such a position, that they could be laid hold of in an instant. While the men were thus employed, the women were not idle. Some were appointed to take care of the canoes; others to secure the provisions, and the few utensils in their possession; and the rest went to gather dry sticks, that a fire might be prepared for dressing their victuals. These huts are sufficiently calculated for affording shelter from the rain and wind. The same tribe, or family, however large, generally associate and build together; so that we frequently saw a village, as well as their larger towns, divided into different districts, by low pallisades, or a similar method of separation. We received considerable advantage from the natives thus coming to take up their residence with us: for every day some of them were employed in catching fish, a good share of which we generally procured by exchanges. This supply, and what our own nets and lines afforded us, was so ample, that we seldom were in want of fish. Besides which, we had other refreshments in abundance: Celery, scurvy-grass, and portable soup, were boiled with the pease and wheat, for both ships companies, every day, and they had spruce beer for their drink. Such a regimen would soon have removed all seeds of the scurvy from our people, if any of them had contracted it; but the truth is, on our arrival here, we had only two invalids in both ships, on the sick list, and these were on board the *Resolution*. We were occasionally visited by other natives, besides those who lived close to us. Their articles of traffic were fish, curiosities, and women; the two first of which were easily disposed of, but the latter did not come to a good market, our crew having conceived a dislike to them. Captain Cook observes upon this occasion, that he connived at a connection with women, because he could not prevent it; but that he never encouraged it, because he dreaded the consequences. "I know, indeed," says the Captain, "that many men are of opinion, that such an intercourse is one of our greatest securities amongst savages; and perhaps they who, either from necessity or choice, are to remain and settle with them, may find it so. But with travellers and transient visitors, such as we were, it is generally otherwise; and, in our situation, a connection with their women betrays more men than it saves. What else can be reasonably expected, since all their views are selfish, without the least mixture of regard or attachment."

My own experience, at least, which hath been pretty extensive, hath not pointed out to me one instance to the contrary."

Among our occasional visitors was a chief called Kahoorā, who headed the party that cut off captain Furneaux's people; and himself killed Mr. Rowe, the officer who commanded. He was far from being beloved by his countrymen, some of whom even imported captain Cook to kill him, at the same time expressing their disapprobation of him in the severest terms. A striking proof of the divisions that prevail among these people occurred to us; for the inhabitants of each village, by turns, solicited our Commanders to destroy the other. On the 15th, we made an excursion, in search after grags, and visited a Hippah, or fortified village, at the S. W. point of the island of Motuara, and the places where our garden had been planted. We found many of the plants and roots in a flourishing condition in the spots that had been cultivated by captain Furneaux's people, but of the seeds sown by Mr. Bailey in 1773, not the least vestige remained. It is probable they had been rooted out to make room for buildings, when the village was re-inhabited. At the other gardens, now wholly over-run with weeds, we found cabbages, onions, leeks, purslain, radishes, mustard, and a few potatoes. These last, brought from the Cape of Good Hope, had been greatly improved by change of soil, and by proper cultivation, would be superior to those produced in most other countries: but the New Zealanders, though fond of this root, had not taken the trouble to plant a single one; but were it not for the difficulty of clearing the ground where potatoes had once been planted, there would not have been any now remaining. As to the hippah, we found no people in it, but the houses and palisades had been rebuilt, and were now in a state of good repair; and we saw evident marks of its having been inhabited not long before.

On the 16th, the two Captains, accompanied by Omiah and several officers, set out, in five boats, to collect fodder for the cattle. Having proceeded about three leagues up the sound, they landed on the E. side, where they cut a quantity of grags, sufficient to load two launches. On their return down the sound, they visited Grags Cove, the place where captain Furneaux's people had been murdered. While on this memorable spot, curiosity induced them to enquire into the circumstances attending the melancholy fate of our countrymen. Here they met with captain Cook's old friend Pedro, who is mentioned by him in the history of his second voyage. He and another New Zealander received them on the beach, armed with the spear and patoo, though not without manifest signs of fear. Their apprehensions, however, were quickly dissipated by a few presents, which brought down to the shore two or three other families. Omiah we are informed was made use of as an interpreter between our people and the natives, his language being a dialect of that of New Zealand: but in a journal, belonging to a gentleman on board the *Discovery*, this circumstance is differently related, and as this, and the character of Omiah, is contrary to that given by the company of the *Resolution*, we shall here lay it before our readers. "Omiah, who could scarce make himself understood, nor indeed could he understand the natives so well as many of the common men who had been frequently here before; yet being a favourite with captain Cook, was always preferred when in company, to confer with the natives, and was desired by him, when he met any of them alone, to question them concerning the massacre of our people that had happened some time ago, and from what cause it took its rise; and he hoped to come at the truth, as the natives, in general, were friendly and ready to furnish the ships with whatever their country afforded. But from what Omiah was able to learn, captain Cook received no satisfaction. It should seem, that in Otaheite there are two dialects spoken, as in almost every other part of the world; one by the priests, and another by the common people. This was apparent here; for Tupia who accompanied Mr. Banks to

this place, in captain Cook's second voyage round the world, could converse with the natives fluently, and was in such esteem with them, that his memory is held in veneration from one end of the island to the other at this day; Obedee likewise, who was of the class of areoes, or gentlemen, and who accompanied captain Cook, in his last voyage, from Otaheite to the Hebrides, New Zealand, Easter Island, and the Marquisas, could converse with the New Zealanders, though Omiah could not, a proof that he was of the inferior class in his own country. While we continued here, he found frequent opportunities to discover his real character, when from under the watchful eye of his protector and friend. He had grog always at his command, and was sometimes entrusted to give it out, especially when any extra quantity was to be delivered by the Captain's orders for hard service, or on days of festivity. At those times he was closely watched, and was never known to run into excess; but when the Captain was abroad for whole days and nights, and he left in charge of liquors, he set no bounds to his excess, and would drink, till he wallowed like a swine in his own filth. At those times he outacted the savage in every kind of sensuality; and when he could no longer act the brute, he would often act the drunkard; storming, roaring, brandishing his arms, and by the contortions of his mouth and face, setting at defiance, after the manner of his country, the whole host of his enemies, who were represented by the common sailors, with whom, upon these occasions, he was generally surrounded; and who knew how to practice upon him, as he endeavoured to do upon the poor Zealanders. He was indeed far from being ill natured; morose, or vindictive; but he was sometimes sulky. He was naturally humble, but had grown proud by habit; and pride so ill became him, that he was always glad when he could put it off, and appear among the petty officers with his natural ease. This was the true character of Omiah, (in the opinion of our journalist), who might be said, perhaps, by accident, to have been raised to the highest pitch of human happiness, only to suffer the opposite extreme, by being again reduced to the lowest order of rational beings."

Pedro, and the rest who were present of the natives, answered all the questions put by Omiah, by captain Cook's orders, without reserve, like men who had no concern in the unfortunate transaction at Grags Cove. Their information imported, that while the boats-crew of the *Adventure* were at dinner, some of the natives stole, or snatched from them, some fish and bread, for which offence they received some blows: a quarrel ensued immediately, and two of the New Zealanders were shot dead, by the only two muskets that were fired; for before a third was discharged the natives rushed furiously upon our people, and, being superior in number, destroyed them all. Pedro, and his companions, also pointed out the spot where the quarrel happened, and the place where the boat lay, in which a black servant of captain Furneaux had been left to take care of it. According to another account, this negro was the occasion of the quarrel; for one of the natives stealing something out of the boat, the black gave him a violent blow with a stick. His countrymen hearing his cries, at some distance, imagined he was killed, and immediately attacked our people, who before they could reach the boat, or prepare themselves against the unexpected assault, fell a sacrifice to the fury of the exasperated savages. The former of these accounts was corroborated by the testimony of many other natives, who could have no interest in disguising the truth. The latter account rests upon the authority of the young New Zealander, who quitted his country for the sake of going with us, and who, therefore, could not, as we may reasonably suppose, be inclined to deceive us. As they all agreed, that the affray happened while the boat's-crew were at dinner, both the accounts may be true; for it is by no means improbable, that, while some of the islanders were stealing from the man who had been left to guard the boat, others might take equal liberties with those who were on shore. It appears, that there was no premeditated plan of bloodshed, and that,

that, if these thefts had not been rather too hastily repented, all mischief would have been avoided; for Kahoor's greatest enemies acknowledged, that he had no previous intention of quarrelling. With regard to the boat, some said, that it had been pulled to pieces and burnt; while others asserted, that it had been carried off by a party of strangers. We have received from a gentleman on board the *Discovery* some other remarkable particulars, relating to this mysterious affair, included in the relation of an adventure, which, though the parties are not of the highest class, our readers, notwithstanding, may think worth relating.

Belonging to the *Discovery* was a youth, with whom a young Zealander girl, about fourteen years of age, fell desperately in love, nor was she wholly indifferent to our adventurer. What time he could spare, he generally retired with her, and they spent the day, but oftener the night, in a kind of silent conversation, in which, though words were wanting, their meaning was perfectly understood. Moments fly rapidly on, that are spent in mutual endeavours to please. She, on her part, had no will but his own, and he, in return, was no less attentive to hers. Minds so disposed naturally incline to render themselves agreeable. A conformity in manners and dress become significant signs between lovers. Though he appeared amiable in her eyes in the dress of a stranger, yet he wished to render himself more so, by ornamenting his person after the fashion of her country; accordingly he submitted to be tattooed from head to foot; nor was she less solicitous to set off herself to the best advantage. She had fine hair, and her chief pride was in the dress of her head. The pains she took, and the decorations she used, would have done honour to an European beauty, had not one thing been wanting to render it still more pleasing. Ghowannahe (that was her name) though young, was not so delicate, but that the traits of her country might be traced in her locks. To remedy this misfortune, and to render it less offensive, she was furnished with combs, and taught by her lover how to use them. After being properly prepared, he would by the hour amuse himself with forming her hair into ringlets, which flowed carelessly round her neck, with a kind of coronet rising from her temples, gave her an air of dignity, that added fresh charms to the brilliancy of her eyes. The dislike arising from colour gradually wore off, and the ardent desire of rendering their sentiments more and more intelligible to each other, gave rise to a new language, consisting of words, looks, and gestures, by which pleasure and pain were more forcibly expressed than by the most refined speech. Having at first acquired the art of imparting their passions, they very soon improved it to the story of their lives. Love and jealousy directed her enquiries concerning the women in the world from whence he came, wishing, at the same time, that he would stay with her, and be a Kakikoo or chief. He made her to understand, that the women in her country were all tatoo (man-killers) and if he stayed with her she would kill him. She replied no; she would ch-na-row, love him. He said her people would kill him. She replied no, if he did not shoot them. He made her to understand, that nine or ten of the men of this world, had been killed and eaten by her people, though they did not shoot them. Her answer was, that was a great while ago, and the people came from the hills roa, roa, meaning a great way off. This excited his curiosity to know, if any of her relations were among the murderers; she sighed, and appeared much affected, when he asked her that question. He demanded if she was at the feast when they broiled and eat the men? She wept, and, looking wishfully at him, hung down her head. He became still more pressing as she grew more reserved. He tried every winning way that love and curiosity suggested, to learn from her what he found she knew, and what she seemed so determined to conceal: but she artfully evaded all his questions. He asked her, why she was so secret? She pretended not to understand him. He repeated the same question, at the same time closing his eyes and keeping them shut. She continued to weep, but made him no an-

swer. Finding all his persuasions ineffectual, he turned from her, seemingly in anger, and threatened to leave her. She caught him round the neck in a violent agitation of mind. He asked her what she meant, and why she wept? She said, they would kill her if she told. He said, they should not know it. Then he would hate her, she said. He answered no, but love her more and more, prelling her to his bosom at the same time: upon which she grew more composed, and said she would tell him all she knew. She then made him understand, that one Gooboa, a bad man, who had been often at the ship, and had stolen many things, when he came to know that it was preparing to depart, went up into the hill country, to the hippah, and invited the warriors to come down and kill the strangers. They at first refused, saying, the strangers were stronger than they, and would kill them with their pow-pow, or fire arms. He told them, they need not fear, for he knew where they must come before they departed, in order to get grass for their goury, or cattle, and that on such occasions they left their pow-pow behind them in the ship, or carelessly about the ground, while they were at work. They said, they were no enemies but friends, and they must not kill men with whom they were in friendship. Gooboa said, they were vile enemies and wicked men, and complained of their chaining him, and beating him, and shewed them the marks and bruises he had received at the ship; and told them besides, how they might silence their pow-pow, by only throwing water over them, and then they could not hurt them. Gooboa likewise undertook to conduct them in safety to the place where the strangers were to come, and shewed them where they might conceal themselves, till he should come and give them notice; which he did. That when the men were busy about getting grass, and not apprehending any danger or harm, the warriors rushed out upon them, and killed them, and afterwards divided their bodies among them. She added, that there were women as well as men concerned; and that the women made the fires, while the warriors cut the dead bodies in pieces. That they did not eat them all at once, but only their hearts and livers; that the warriors had the heads, which were esteemed the best, and the rest of the flesh was distributed among the crowd. Having by various questions in the course of several days, extorted this relation, of which, he said, he had no reason to doubt the truth, he forbore to ask her, what part her relations and herself bore in this tragedy, as there was reason to believe, they were all equally concerned. He was, however, very solicitous to learn, if any such plot was now in agitation against the people that might be sent, upon the same service to Grass Cove, or any other convenient place. Her answer was, no: the warriors were afraid at first, that the ships were come to revenge the death of their friends, and that was the reason why she was forbidden to speak of killing the strangers; or to own any knowledge of that incident, should she be questioned concerning it. She said, she was but a child, not ten years old; but she remembered the talk of it, as a gallant action of great achievement, and that songs of praise were made upon that occasion. In the course of his conversation with this girl, who seemed to be of the second class, he learned many things concerning the natural temper of the natives, and their domestic policy. She said, the people of T'Avi-Poennammoo, or the southern division of the island, were a fierce bloody people, and had a natural hatred to the people of Ea-hei-no-mauwe, and killed them, when found at any time in their country; but that the people of Ea-hei-no-mauwe were a good people, and friendly to one another, but never suffered any of the people of T'Avi-Poennammoo to settle among them, because they were enemies; that these two nations, the people of the north part of the sound, and those of the south, were ever at war, and eat one another; but that the people of either country, when they fought, never eat one another. With respect to their domestic policy, she said, the fathers had the sole care of the boys as soon as they could walk, and that the girls were left wholly at their mother's disposal. She said, it was a crime for a mo-
ther

ther to correct her son, after he was once taken under the protection of the father; and that it was always resented by the mother, if the father interfered with the management of the daughters. She said, the boys, from their infancy, were trained to war, and both boys and girls were taught the arts of fishing, weaving their nets, and making their hooks and lines: that their canoes came from a far country, and they got them in exchange for cloth, which was chiefly manufactured by the women: that their weapons and working tools descended from father to son, and that those who were taken in battle supplied the rising generation: that they had no kings among them, but that they had men who conversed with the dead, who were held in great veneration, and consulted before the people went to the wars: that these were the men who addressed strangers that came upon the coast, first in the language of peace, at the same time denouncing vengeance against them, if they came with any hostile design: that their persons were held sacred, and never killed in the wars, which ever side prevailed: that when the warriors of either nation made prisoners, they were never of the meaner sort, but of some chiefs, whom they afterwards killed and eat; but that to the common sort they never gave quarter: that they sometimes tortured an enemy, if they found him lurking singly in the woods, looking upon him as coming upon no good design; but never otherwise: that they lived chiefly upon fish, which were caught in the sound in abundance, during the summer; but that in the winter they retired to the north, where they subsisted on the fruits of the earth, with which they were supplied for their labour, working in the plantations, or assisting the builders in fabricating their boats. The intelligence thus obtained from this young Zealander appears to be authentic from many circumstances; but chiefly from observing, that the large vessels that came from the north to trade, several of them having 90 or 100 persons on board, had never any fish to sell, but were laden with the various manufactures of cloth, wood, and green stones, formed into implements of use, or consisting of raw materials ready prepared for fabrication. Their crews appeared to be of a superior class to those who constantly plied in the sound, and were under proper discipline; whereas the fishing boats seemed to be the sole property of the occupiers, no other person claiming any superiority over them.

Our party belonging to the Resolution continued in Grays Cove till the evening, when having loaded the rest of the boats with grass, cellery, &c. we then embarked to return to the ships; but had scarcely left the shore, when the wind began to blow violently at N. W. so that it was not without great difficulty that we could reach the ships, where some of the boats did not arrive till the next morning, and we had but just got aboard, when the gale increased to a perfect storm, attended with heavy rain: but, in the evening, the wind veering to the east, brought on fair weather. No work could go forward on the 17th, but on the 18th our men resumed their different employments, the natives ventured out to catch fish, and Pedro with his whole family, came to reside near us. The proper name of this chief is Matahouah; but some of Captain Cook's company had given him the appellation of Pedro in a former voyage. On Thursday the 20th, we had another storm, of less duration than the former, but much more violent; and we had scarcely men enough on board to hand the sails. By ten o'clock, A. M. the strong gales drove the Discovery from her moorings; and it was owing to providence that, having run foul of the Resolution, she did not perish, the surge carrying her off instantaneously, with little damage to either ship. All hands on board were thrown into the utmost confusion. No sooner was she clear than both ships got down top-gallant-yards, struck top-gallant-masts, lowered the yards, got in the cables, moored with their best bower anchors, and happily rode out the storm. These tempests are frequent here; and the nearer the shore, the more their effects are felt; for the neighbouring mountains, which, at these times, are loaded with vapours, not only in-

crease the force of the wind, but alter its direction in such a manner, that no two blasts follow each other from the same quarter. The gale continuing the whole day, no Indians came to trade. On the 21st, a tribe or family of about 30 persons came from the upper part of the sound to visit us, whom we had not seen before. Their chief was named Tomatongauoanuc. He was about the age of forty-five, having a frank, cheerful countenance; and the rest of his tribe were, upon the whole, the most handsome of all the New Zealanders that we had seen. By this time upwards of two-thirds of the natives of Queen Charlotte's Sound had settled near us, numbers of whom daily resorted to the ships, and our encampment on shore; but the latter was most frequented, during the time when our people were making seal-blubber; for no Greenlanders were ever fonder of train oil, than our friends here seemed to be: they relished even the dregs of the casks, and skimmings of the kettle, and considered the neat stinking oil as a most delicious feast. Having got on board a supply of hay and grass, sufficient for the cattle during our passage to Otaheite; and having compleated our wood and water, we struck our tents, and brought every thing off from the shore.

On the 23d, in the morning, the old Indian, who had harangued the captains when they approached the shore, repaired on board the Discovery, and made a present to her captain of a compleat stand of their arms, and some very excellent fish, which were kindly received; and, in return, Captain Clerke gave him a brass patoo-patoo, made exactly in their fashion and manner, on which were engraven his majesty's name and arms, the names of the ships, the date of their departure from England, and the business they were sent upon; he gave him likewise a hatchet, a knife, some glass ornaments, and nails, which he highly prized, though of small value. In the evening some of the natives brought a man bound, whom they offered to sell, but their offer being rejected, they carried him back, and in the night, a most horrid yelling was heard in the woods, which excited the curiosity of our gentlemen to examine into the cause. The cutter was ordered to be manned, a party of marines to be put on board, and the two captains, with proper attendants, directed their course to the west-side of the bay, where they saw several fires just lighted, and where they hoped to have surprized the natives, before they had put their poor captive to death, whom they had just before consigned to slavery; but in this hope they were disappointed.

Though the natives appeared friendly during our stay, it was judged proper to keep the time of our departure secret till all things were on board, and we were ready to set sail. This precaution Captain Cook thought the more necessary from what we knew of the treachery of the savages. By not allowing them to concert any new plot, he secured effectually our foraging parties from the danger of a surprize, and by suddenly giving orders to sail, he prevented our men from rambling after the women when their business was done, which they never failed to do whenever it was in their power. The foraging parties here mentioned are those who were sent to the coves, at the distance of perhaps three or four leagues from the ships, to cut grass for the live stock, and to gather herbs to boil with the portable soup for the men; and those who were stationed in the woods, to get spruce to brew into beer for their preservation from the scurvy, against which that liquor, as we have already observed, was found a most powerful antidote. Of grass and herbs a large quantity was brought on board, and of spruce as much as served the two crews for drink near thirty days, during which time no grog was delivered out. The parties ordered upon these services went always well armed, and were guarded by marines, though Captain Cook entertained very high notions of the honour as well as bravery of the New Zealanders.

On Monday the 24th, we weighed anchor, and stood out of the Cove; but the wind not being so fair as we could have wished, and knowing the tide of ebb would be spent before we could get out of the sound, we cast anchor

anchor again a little without the island of Motuara, to wait for a more favourable opportunity of putting into Cook's Strait. While we were getting under sail, the captain gave to Tomatongauroanuc two pigs, a boar and a sow; and to Matahouah two goats, a male and female, after they had promised not to destroy them. As to the animals which Captain Furneaux had left here, we were told they were all dead; but no intelligence could be obtained concerning those Captain Cook had left in West Bay, and in Cannibal Cove, in his former voyage: however, all the natives we conversed with agreed, that poultry are now to be met with wild in the woods behind Ship Cove; and we were afterwards informed, by the two New Zealand youths, who went away with us, that Tiratou, a popular chief, had in his possession many cocks and hens, besides a sow. We had not been long at anchor near Motuara, before several canoes, filled with natives, came towards us, and we carried on a brisk trade with them for curiosities. In one of these canoes was Kahooru, whom Omiah pointed out immediately to Captain Cook; and he being the leader of the party who had cut off the crew of the Adventure's boat, Omiah solicited our commander to shoot him. Not satisfied with this, he addressed himself to that chief, threatening, to be his executioner, should he ever presume to visit us again: but this menace had so little influence upon Kahooru, that he returned to us the next morning, accompanied with his whole family. Omiah, having obtained Captain Cook's permission, introduced him into the cabin, saying, "There is Kahooru, kill him," but fearing, perhaps, he should be called upon to put his former declaration in execution, he instantly retired. In a short time, however, he returned; and perceiving the chief remained unhurt, he remonstrated to the captain with much earnestness, saying, "Why do you not kill him? If a man kills another in England he is hanged: this man has killed ten, yet you will not kill him." These arguments, however plausible, had no weight with our commander, who desired Omiah to ask the New Zealand Chief, why he had killed Captain Furneaux's people? Confounded at this question, Kahooru hung down his head, folded his arms, and seemed in expectation of immediate death: but as soon as he was assured of safety, he became cheerful. He appeared, however, still unwilling to answer the question which had been put to him, till after repeated promises, that no violence should be offered him. Upon this he at last ventured to inform us, that one of the natives having brought a stone hatchet for the purpose of barter, the person to whom it was offered took it, and refused either to return it, or give any thing in exchange for the same, whereupon the owner seized some bread as an equivalent, and this gave rise to the quarrel that ensued. He also said, that he himself during the disturbance had a narrow escape; for a musquet was levelled at him, which he found means to avoid by skulking behind the boat; but another man, who happened to stand close to him, was shot dead. As soon as the musquet was discharged, he, (Kahooru,) instantly attacked Mr. Row, the officer, commander of the party, who defended himself with his hanger, (with which he gave Kahooru a wound in the arm,) till he was overpowered by numbers. The remainder of Kahooru's account of this unhappy affair, differed very little from what we had before learnt from the rest of his countrymen. Most of these whom we had conversed with, expected that Captain Cook would take vengeance on Kahooru for his concern in the massacre; and many of them not only wished it, but testified their surprize at the captain's forbearance and moderation. As the chief must have been made acquainted with the sentiments of the natives, it was a matter of astonishment, that he so often put himself in our power: his two last visits, in particular, were made under such circumstances, that he could not have flattered himself with a probability of escaping, had the captain been inclined to detain him: and yet, when his first fears, on being questioned, had subsided, so far was he from entertaining uneasy sensations, that, on seeing in the cabin a portrait of a New Zealander,

he requested that his own likeness might be taken, and without the smallest token of impatience, sat till Mr. Webber had finished his portrait. Captain Cook admired his courage, and was pleased with the confidence which he reposed in him; for he placed his whole safety in the uniform declarations of the captain; that he had always been a friend to the natives, and would continue so till they gave him reason to behave otherwise; that he should think no more of their barbarous treatment of our countrymen, as that transaction had happened long ago; but that, if they should ever venture to make a second attempt of that kind, they might rest assured of feeling the full weight of his resentment. Mr. Burney, whom Captain Furneaux dispatched, with an armed party, in search of his people who were missing, had, upon discovering the melancholy proofs of this catastrophe, fired several volleys among the natives who were still on the spot, and were probably partaking of the horrid banquet of human flesh. It was reasonable to suppose this firing might not be ineffectual; but upon inquiry it appeared, that not a single person had been killed, or even wounded, by the shot which Mr. Burney's people had discharged.

We must here observe, that previous to the ships sailing, the crews of both were ordered upon deck, as usual, to answer to their names, when one, on board the Discovery, was missing. This was the lover, (whose episode, having already begun, we shall now conclude,) who pretended sickness, in order to facilitate his escape from the ship. With this view, as soon as he had passed the surgeon's examination, and the coast was clear, he dressed himself in the habit of a New Zealander; and, being tattooed all over, to say the truth, the copy was not easily to be distinguished from the original. Ghowannahe, who was in the secret, had assembled her friends together, and sent them on board in order to increase the crowd, which, upon such occasions, when ships are ready to sail, are generally pretty numerous. Among this party he found a favourable opportunity to mix, and hastening to their canoe, when the decks were ordered to be cleared, they were not long in paddling to shore. The pleasure which Ghowannahe expressed, on seeing the ship set sail, cannot easily be conceived; but her joy was of short continuance. In the afternoon, our adventurer's messmate went down to enquire after his health, and was not a little surprized when no answer was returned. He thought, at first, he might have retired; but on searching every where below to no effect, he gave the alarm throughout the ship, when it was discovered, that he had eloped bag and baggage; and that the chest he had left in his berth was empty. A messenger was instantly dispatched on board the Resolution, to know how to proceed; and when the message was delivered, the two captains and officers were enjoying their bottle. At first it only furnished a subject of harmless pleasantries; but it came to be seriously debated at last, whether the man should be sent for back, or totally deserted. Some were in doubt, whether an accident might not have happened; but that doubt was soon cleared up, when it was known, that his effects were missing as well as the man. Most of the officers present were for leaving him to follow his own humour; but Captain Cook thinking it would be a bad precedent, and an encouragement to other enamourates, when they came to the happier climes, to follow his example, was for sending an armed force, and bringing the lover back at all hazards. Of this opinion was Captain Clerke, with whom this man was a favourite, who gave orders for the cutter to be properly manned, a serjeant's guard of marines to be put on board, and his messmate as a guide to direct them to the place where he was to be found. These orders were instantly carried into execution. It was midnight before the cutter could reach the landing-place, and near two in the morning before the marines could find the spot where the lovers used to meet. They surprized him in a profound sleep, when he was dreaming of only kingdoms and diadems; of living with his Ghowannahe in royal state; of being the father of a numerous progeny of

of princes to govern the kingdoms Eakeinommauwe and T'Avi-Poenammoo; and of being the first founder of a great empire! but what a sudden transition! to be waked from the visionary scene of regal grandeur, and to find himself a poor prisoner, to be dragged to punishment for, as he thought, a well laid plan of monarchy; and, what was worse, his final separation from his faithful Ghowannahe, was a task he had still to undergo. Their parting was tender, and for a British sailor and savage Zealander, was not unaffectionate. The scene, however, was short. The marines paid no regard to the copious tears, the cries, and lamentations, of the poor deserted girl; nor did they think it safe to tarry in a place so desolate, where lamentations in the night were not unusual to bring numbers together, for the purpose of slaughter. He was, therefore, hurried to the shore, followed by Ghowannahe, who could hardly be torn from him, when ready to embark. Love, like this, is only to be found in the regions of romance, in those enlightened countries, where the boasted refinements of sentiment have circumscribed the purity of affection, and narrowed it away to mere conjugal fidelity. He was scarce on board the cutter, when he recollected, that he had left his baggage behind; all that he had provided for laying the foundation of his future grandeur. It was therefore necessary he should return with the marines to the magazine, where all his stores were deposited, and these not a few. Besides his working implements, he had a pocket compass, of which he had thought on some future occasion to make a proper use. He had also a fowling-piece, which had been conveyed away secretly by Ghowannahe. It would be tedious to recount the numerous articles that our adventurer had provided. Let it suffice, that the marines and himself were pretty heavily laden in bringing them on board the cutter. It was noon, the next day, before he arrived at the ships, and the captains began to be in some fear for the party of marines, who were sent to bring him back. Before he came in sight it had been proposed to try him as a deserter; and therefore instead of being received in his own ship, he was ordered on board the *Resolution*, where he underwent a long examination, and made a full confession of all his views, and of the pains he had taken to bring them to perfection. He said, the first idea of desertion struck him, when in an excursion round the bay, in which he attended Captain Clerke, he was charmed with the beauty of the country, and the fertility of the soil; that seeing the gardens that had been planted on Long Island, at Motuara, and other places, in so flourishing a condition; and that there were European sheep and hogs, and goats, and fowls, sufficient to stock a large plantation, if collected together from the different places where they had been turned loose, it came into his head, that if he could meet with a girl that was to his liking, he could be happy in introducing the arts of European culture into so fine a country, and in laying the foundation of civil government among its inhabitants. This idea improved upon him hourly, and when he happened to meet the girl before mentioned, who had seen him in his tour, and who had followed him to the tents, and had learnt from herself, that love had brought her there, it inflamed his desire beyond all bounds. And finding her inclination to meet the wishes of his heart, he no longer hesitated, but became firmly resolved, at all events, to yield to the force of inclination. He had revolved in his mind, he said, the hazard and the reward; and had concerted with Ghowannahe the plan for his escape. When Captain Cook heard his story, his resentment was converted into laughter at the wild extravagance of his plan, which he thought truly romantic, and instead of trying him for desertion, ordered him on board his own ship, the *Discovery*, to be punished as Captain Clerke should think proper, who, on his return aboard, sent him to the gun to receive one dozen of lashes; and thus terminated all his hopes of being a mighty emperor. The distress of Ghowannahe is hardly to be conceived; left a woeful spectacle, to lament her fate. She expressed

her grief by punctures made in her face, arms and neck, and wherever despair prompted her to direct the bloody instrument: so that one might think, those savage people, whose bodies are exposed to the severities of the seasons, are not so susceptible of pain as those of a finer texture; otherwise, her personal feelings must have been exquisite, independent of those of her mind. But we shall now take leave of the two lovers, and continue the history of our voyage.

It was about seven o'clock, A. M. when the *Resolution* and *Discovery* cleared the cove, and about eleven when they cast anchor near the isle of Motuara. Before our arrival at New Zealand, Omiah had expressed a desire of taking one of the natives with him to his own country. He soon had an opportunity of gratifying his inclination; for a youth named Taweiharooa, the only son of a deceased chief, offered to accompany him, and took up his residence on board. Captain Cook caused it to be made known to him and all his friends, that if the youth departed with us, he would never return. This declaration, however, had no effect; and this afternoon, Taratoutou, his mother, came on board to receive her last present from Omiah. The same evening she and Taweiharooa parted, with all the marks of tender affection that might be expected between a parent and a child, who were never to meet again. But she said she would weep no more, and kept faithfully her word; for the next morning, when she returned to take a last farewell of her son, she was quite cheerful all the time she remained on board, and departed with great unconcern. A boy, named Kokoa, about ten years of age, accompanied Taweiharooa as a servant: he was presented to Captain Cook by his own father, who parted with him with such indifference, as to strip him, and leave him entirely naked. The Captain having in vain endeavoured to convince these people of the improbability of these youths ever returning home, at length consented to their going. Though much has been said concerning this country and its inhabitants, in the accounts of Captain Cook's two former voyages; yet his observations made at this time, and the remarks of the ingenious Mr. Anderson, being the result of accurate examination, may not be considered by our friends and respectable subscribers as altogether superfluous.

About Queen Charlotte's Sound the land is uncommonly mountainous, rising immediately from the sea into large hills. At remote distances are valleys, terminating each towards the sea in a small cove, with a pebbly or sandy beach; behind which are flat places, where the natives usually build their huts. This situation is the more convenient, as a brook of fine water runs through every cove, and empties itself into the sea. The bases of the mountains, towards the shore, are constituted of a yellowish sand-stone, which requires a blueish cast where it is washed by the sea. At some places it runs in horizontal, and, at others, in oblique strata. The mould or soil by which it is covered resembles marle, and is, in general, a foot or two in thickness.

The luxuriant growth of the productions here sufficiently indicates the quality of the soil. The hills, except a few towards the sea, are one continued forest of lofty trees, flourishing with such uncommon vigour, as to afford an august prospect to the admirers of the sublime and beautiful works of nature. This extraordinary strength in vegetation is, doubtless, greatly assisted by the agreeable temperature of the climate; for at this time, though answering to our month of August, the weather was not so warm as to be disagreeable; nor did it rise the thermometer higher than 66 deg. The winter also seems equally mild with respect to cold; for in the month which corresponds to our December, the mercury was never lower than 48 deg. the trees at the same time retaining their verdure, as if in the height of summer. It is supposed their foliage remains, till pushed off by fresh leaves succeeding in spring. Notwithstanding the weather is generally good, it is sometimes windy, with heavy rain,

which, however, is never excessive, and does not last above a day. In short, this would be one of the finest countries upon earth, were it not so extremely hilly; which, supposing the woods to be cleared away, would leave it less proper for pasturage than flat land; and infinitely less so for cultivation, which could never be effected here by the plough.

The large trees on the hills are principally of two sorts. One of them of the size of our largest firs, grows nearly after their manner. This supplied the place of spruce in making beer; which was done with a decoction of its leaves, fermented with sugar, or treacle; and this liquor was acknowledged to be little inferior to American spruce-beer. The other sort of tree is like a maple, and often grows very large, but is fit only for fuel: the wood of that, and of the preceding, are too heavy for either masts or yards. A greater variety of trees grow on the flats behind the beaches; two of these bear a kind of plumb, of the size of prunes; the one, which is yellow, is called karraca, and the other, which is black, called maitao; but neither of them had a pleasant taste, though eaten both by our people and the natives. On the eminences which jut out into the sea, grows a species of philadelphus, and a tree bearing flowers almost like a myrtle. We used the leaves of the philadelphus as tea, and found them an excellent substitute for the oriental sort. A kind of wild celery, which grows plentifully in almost every cove, may be reckoned among the plants that were useful to us, and also another which we called scurvy grass. Both sorts were boiled daily with wheat ground in a mill, for the ships companies breakfast, and with their pease-soup for dinner. Sometimes they were used as salad, or dressed as greens; in all which ways they are excellent; and, together with the fish, with which we were plentifully supplied, they formed a most desirable refreshment. The known kind of plants to be found here are bindweed, night-shade, nettles, a shrubby speedwell, sow-thistles, virgin's bower, vanelloe, French willow, euphorbia, crane's bill, cudweed, rushes, bulrushes, flax, all-heal, American night-shade, knot-grass, brambles, eye-bright, and groundsel; but the species of each are different from any we have in Europe. There are a great number of other plants; but one in particular deserves to be noticed here, as the garments of the natives are made from it. It grows in all places near the sea, and sometimes a considerable way up the hills, in bunches or tufts, bearing yellowish flowers on a long stalk. It is remarkable, that the greatest part of the trees and plants were of the berry-bearing kind; of which, and other seeds, Mr. Anderson brought away nearly thirty different sorts.

The birds of which there is a tolerable good stock, are almost entirely peculiar to the place. It would be difficult and very fatiguing to follow them, on account of the quantity of underwood, and the climbing plants; yet any person, by continuing in one place, may shoot as many in a day as would serve seven or eight persons. The principal kinds are large brown parrots, with grey heads; green parroquets, large wood-pigeons, and two sorts of cuckoos. A gros-beak, about the size of a thrush, is frequent; as is also a small green-bird, which is almost the only musical one to be found here; but his melody is so sweet, and his notes so varied, that any one would imagine himself surrounded by a hundred different sorts of birds, when the little warbler is exerting himself. From this circumstance it was named the mocking-bird. There are also three or four sorts of smaller birds; and among the rocks are found black sea-pies, with red bills, and crested shags of a leaden colour. About the shore, there are a few sea-gulls, some blue herons, wild ducks, plovers, and some land-larks. A snipe was shot, differing very little from that species of birds in Europe. Insects here, are not very numerous: we saw some butter-flies, two sorts of dragon-flies, some small grass-hoppers, several sorts of spiders, some black ants, and scorpion-flies innumerable, with whose chirping the woods resounded. The sand-fly, which is the only noxious one, is very numerous here, and is almost as disagreeable as the musquitoe.

The only reptiles we saw, were two or three sorts of inoffensive lizards. In this extensive land, it is remarkable that there should not even be the traces of any quadruped, except a few rats, and a kind of fox-dog, which is kept by the natives as a domestic animal. Nor have they any mineral deserving of notice, but a green jasper or serpent-stone, of which the tools and ornaments of the inhabitants are made. This is held in high estimation among them; and they entertain some superstitious notions about the mode of its generation, which we could not comprehend: they say it is taken from a large river far to the southward; it is disposed in the earth in detached pieces like flints, and, like them, the hedges are covered with a whitish crust.

Most of the fish we caught by the seine were elephant-fish, mullets, soles, and flounders; but the natives supplied us with a kind of sea-bream, large conger eels, and a fish of five or six pounds weight, called by the natives a mogge. With a hook and line we caught a blackish fish, called cole-fish by the seamen, but differing greatly from that of the same name in Europe. We also got a sort of small salmon, skate, gurnards, and nurfes. The natives sometimes furnished us with hake, paracutus, parrot-fish, a sort of mackerel, and leather jackets; besides another, which is extremely scarce, of the figure of a dolphin, in colour black, and with strong boney jaws. These in general, are excellent to eat; but the small salmon, cole-fish, and mogge, are superior to the others.

The New Zealanders, we mean those of them who inhabit about Queen Charlotte's Sound, are a people who appear to be perfectly satisfied with the smallittance of knowledge they have acquired, without attempting in the least to improve it. Nor are they remarkably curious, either in their observations, or their inquiries. New objects do not strike them with such a degree of surprize as one would naturally expect; nor do they even fix their attention for a moment. Omiah, indeed, who was a great favourite with them, would sometimes attract a circle about him; but they seemed to listen to his speeches, like persons who neither understood, nor wished to understand, what they heard. In general, they are not so well formed, especially about the limbs, as the Europeans, nor do they exceed them in stature. Their sitting so much on their hams, and being deprived, by the mountainous disposition of the country, of using that kind of exercise which would render the body straight and well-proportioned, is probably the occasion of the want of due proportion. Many of them, indeed, are perfectly well formed, and some are very large boned and muscular, but very few among them are very corpulent. Their features are various, some resembling Europeans, and their colour is of different casts, from a deepish black to an olive or yellowish tinge. In general, however, their faces are round, their lips rather full, and their noses, (though not flat) large towards the point. An aquiline nose was not to be seen among them; their eyes are large, and their teeth are commonly broad, white, and regular. The hair, in general, is black, strong, and straight; commonly cut short on the hinder part, and the rest tied on the crown of the head. Some, indeed, have brown hair, and others a sort that is naturally disposed to curl. The countenance of the young is generally free and open; but in many of the men it has a serious, or rather sullen cast. The men are larger than the women; and the latter are not distinguished by peculiar graces, either of form or features.

Both sexes are clothed alike: they have a garment, made of the silky flax already mentioned, about five feet in length, and four in breadth. This appears to be their principal manufacture, which is performed by knotting. Two corners of this garment pass over their shoulders, and they fasten it on the breast with that which covers the body: it is again fastened about the belly with a girdle made of mat. Sometimes they cover it with dog skin, or large feathers. Many of them wear mats over this garment, extending from the shoulders to the heels. The most common covering, however, is a quantity of sedgy plant, badly manufactured,

A Chest of New Zealand, as a Specimen of the Carving of that Country.

A Military Gorget worn in the South Sea Islands.

tured, fastened to a string, and thrown over the shoulders, whence it falls down on all sides to the middle of the thighs. When they sat down in this habit, they could hardly be distinguished from large grey stones, if their black heads did not project beyond their coverings. They adorn their heads with feathers, combs of bone or wood, with pearl-shell, and the inner skin of leaves. Both men and women have their ears slit, in which are hung beads, pieces of jasper, or bits of cloth. Some have the septum of the nose bored in its lower part; but we never saw any ornaments worn in that part; though a twig was passed through it by one of them, to shew that it was occasionally used for that purpose. We saw many stained in the face with curious figures, of a black or dark blue colour; but it is not certain whether this is intended to be ornamental, or as a mark of particular distinction: the women also wear necklaces of shark's teeth, or bunches of long beads; and a few of them have small triangular aprons, adorned with feathers or pieces of pearl-shells, fastened about the waist with a double or treble set of cords.

They live in the small coves already mentioned, sometimes in single families, and sometimes in companies of perhaps forty or fifty. Their huts, which are in general most miserable lodging-places, are built contiguous to each other. The best we saw was built in the manner of one of our country barns, about six feet in height, fifteen in breadth, and 33 in length. The inside was strong and regular, well fastened by means of withes, &c. and painted red and black. At one end it had a hole serving as a door to creep out at, and another considerably smaller, seemingly for the purpose of letting out the smoke. This, however, ought to be considered as one of their palaces, for many of their huts are not half the size, and seldom are more than four feet in height. They have no other furniture than a few small bags or baskets, in which they deposit their fishing-hooks and other trifles. They sit down in the middle round a small fire, and probably sleep in the same situation, without any other covering than what they have worn in the day. Fishing is their principal support, in which they use different kinds of nets, or wooden fish-hooks pointed with bone; but made in so extraordinary a manner, that it appears astonishing how they can answer such a purpose. Their boats consist of planks raised upon each other, and fastened with strong withes. Many of them are 50 feet long. Sometimes they fasten two together with rafters, which we call a double canoe: they frequently carry upwards of 30 men, and have a large head, ingeniously carved and painted, which seems intended to represent the countenance of a warrior, when engaged in the heat of action. Their paddles are narrow, pointed, and about five feet long. Their sail, very seldom used, is a mat formed into a triangular shape. When the weather will not suffer them to go to sea, muscles and sea-eels supply the place of other fish. Sometimes, but not often, they kill a few penguins, rails, and shags, which enable them to vary their diet. Considerable number of their dogs are also bred for food; but they depend principally on the sea for their subsistence, by which they are most bountifully supplied.

They dress their fish by roasting, or rather baking them, being entirely ignorant of the art of boiling. It is thus they also dress the root of the large fern-tree, in a hole prepared for that purpose: when dressed, they split it, and find a gelatinous substance within, somewhat like sago powder. The smaller fern-root seems to be their substitute for bread, being dried and carried about with them, together with large quantities of dried fish, when they go far from their habitations. They are as filthy in their feeding as in their persons, which often emit a very offensive effluvia, from the quantity of grease about them, and from their never washing, their heads are plentifully stocked with vermin, which they sometimes eat. Large quantities of stinking train oil, and blubber of seals, they would eagerly devour. When on board the ships, they not only emptied the lamps, but actually swallowed the cotton with equal eagerness. Though the inhabitants of Van Diemen's

Land would not even taste our bread, these people devoured it with the greatest eagerness, even when it was rotten and mouldy.

In point of ingenuity, they are not behind any uncivilized nations under similar circumstances: for, without the assistance of metal tools, they make every thing by which they procure their subsistence, cloathing, and warlike weapons, with neatness, strength, and convenience. Their principal mechanical tool is formed in the manner of an adze, and is made of the serpent-stone, or jasper: their chisel and gouge are furnished from the same material, though they are sometimes composed of black solid stone. Carving, however, is their master-piece, which appears upon the most trifling things: the ornaments on the heads of their canoes, not only display much design, but execution. Their cordage for fishing-lines is not inferior to that in England, and their nets are equally good. A shell, a bit of flint, or jasper, is their substitute for a knife, and a shark's tooth, fixed in the end of a piece of wood, is their auger. They have a saw made of some jagged fishes teeth, fixed on a piece of wood nicely carved; but this is used for no other purpose, than to cut up the bodies of those whom they kill in battle.

Though no people are more ready to resent an injury, yet they take every opportunity of being insolent, when they apprehend there is no danger of punishment; whence it may be concluded, that their eagerness to resent injuries, is rather an effect of a furious disposition than genuine bravery. They are naturally distrustful and suspicious, for such as are strangers never venture immediately to visit our ships, but keep at a small distance in their boats, observing our motions, and hesitating whether they should risk their safety with us. They are to the last degree dishonest, and steal every thing within their reach, if they suppose they can escape detection; and, in trading, they seem inclined to take every possible advantage; for they never trust an article out of their hands for examination, and seem highly pleased if they have over-reached you in a bargain. Such conduct indeed is not surprising, when it is considered, that there appears to be little subordination, and few, if any, laws for the punishment of transgressors. No man's authority extends beyond his own family; and when they join at any time, for mutual defence or safety, those among them who are most eminent for valour and prudent conduct, are directors.

Their public contentions are almost perpetual, for war is their principal profession, as appears from their number of weapons, and their dexterity in using them. Their arms are spears, patoos, and halberts, and sometimes stones. The first are from five to thirty feet long, made of hard wood and pointed. The patoo is about eighteen inches long, of an elliptical shape, with a handle made of wood, stone, &c. and appears to be their principal dependance in battle. The halbert is about five or six feet in length, tapering at one end with a carved head, and broad, or flat, with sharp edges, at the other. Before the onset, they join in a war song, keeping the exactest time; and, by degrees, work themselves into a kind of frantic fury, accompanied with the most horrid distortions of their tongues, eyes, and mouths, in order to terrify their enemies. To this succeeds a circumstance, that is most cruel, and disgraceful to human nature, which is mangling and cutting to pieces (even when not perfectly dead) the bodies of their enemies, and, after roasting them, devouring their flesh with peculiar satisfaction and even pleasure. It might naturally be supposed, that those who could be capable of such excess of cruelty, must be totally destitute of every human feeling, and yet they lament the loss of their friends in a manner the most tender and affectionate. Both men and women, upon the death of their relations or friends, bewail them with the most miserable cries; at the same time cutting large gashes in their cheeks and foreheads, with shells, or pieces of flint; till the blood flows copiously, and mixes with their tears; They also carve a resemblance of an human figure, and hang it about their necks, as a memorial of those who were dear to them. They also perform the ceremony of lamenting

lamenting and cutting for joy, at the return of a friend who has been some time absent. The practices of the fathers, whether good or bad, their children are, at an early age, instructed in; so that you find a child of either sex, of the age of nine or ten years, able to imitate the frightful motions and gestures of the men. They also sing, and with some degree of melody, the traditions and actions of their forefathers, with which they are immoderately delighted, and pass much time in these amusements, accompanied sometimes with a kind of flute.

From captain Cook's observations, and from the information of Taweharooa, and others, it appears, that the New Zealanders must live under perpetual apprehensions of being destroyed by each other; there being few of their tribes that have not, as they think, sustained wrongs from some other tribes, which they are continually upon the watch to revenge. And, perhaps, the desire of a good meal may be no small incitement. It is said, that many years will sometimes elapse, before a favourable opportunity happens, and that the son never loses sight of an injury that has been done to his father. Their method of executing their horrible designs, is by stealing upon the adverse party in the night; and if they find them unguarded, (which is very seldom the case) they kill every one indiscriminately; not even sparing the women and children. When the massacre is completed, they either feast and gorge themselves on the spot, or carry off as many of the dead bodies as they can, and devour them at home, with acts of savage brutality too shocking to be described. If they are discovered before they can execute their bloody purposes, they generally steal off again; but are sometimes pursued and attacked by the other party, in their turn. To give quarter, or to take prisoners, makes no part of their military law; so that the vanquished can only save their lives by flight. This perpetual state of war, and destructive method of conducting it, operates so strongly in producing habitual circumspection, that one hardly ever finds a New Zealander off his guard, either by night or by day. Indeed, no other man can have such powerful motives to be vigilant, as the preservation both of body and soul depends upon it: for according to a principle in their creed, the soul of a man whose flesh is devoured by the enemy, is doomed to a perpetual fire, while the soul of the man whose body has been rescued from those who killed him, as well as the souls of all who die a natural death, ascend to the dwellings of the gods. When enquiry was made, whether they devoured the flesh of such of their friends as had been killed in war, but whose bodies were saved from falling into the enemies hands? They seemed surprized at the question, which they answered in the negative, expressing some abhorrence at the very idea. Their common method of disposing of their dead, is by depositing their bodies in the earth, but if they have more of their slaughtered enemies than they can eat, they throw them into the sea.

As to their religion, we can say little concerning either its principles or ceremonies; but we know its instructions are very strongly inculcated into them from their infancy: of which a remarkable instance was seen, in the youth, who was first destined to accompany Taweharooa. He refrained from eating the greatest part of the day, on account of his hair being cut; though every method was used to induce him to break his resolution; and he was tempted with the offer of such victuals as he was known to esteem the most: but he said, in answer to our pressing solicitations, if he eat any thing that day, that Eatooa would kill him. However, towards evening, the cravings of nature got the better of his professed tenets, and he eat, though sparingly; it was thought before this, that they had some superstitious notions about their hair; for we frequently observed quantities of it tied to the branches of trees near some of their habitations; but we could not learn from what notions, or on what account this was done. They have no morais, or other places of public worship; nor do they ever assemble together with

this view: but they have priests, who alone address the gods in prayers, for the prosperity of their temporal affairs; such as an enterprize against a hostile tribe, a fishing party, or the like. Polygamy is allowed among these people; and it is not uncommon for a man to have two or three wives. The women are marriageable at a very early age; and it should seem, that one who is unmarried, is but in a forlorn state. She can with difficulty get a subsistence: at least she is, in a great measure, without a protector, though in constant want of a powerful one.

Their language is neither harsh nor disagreeable: and yet the pronunciation is frequently guttural; and whatever qualities are requisite to make a language musical, prevail to a high degree in this; which we observed particularly in the melody of their songs. It is not, indeed, so comprehensive as our European languages, which owe their perfection to long and gradual improvement. Mr. Anderson collected both now and in the course of our former voyage, a great many of their words, so as to form a pretty large vocabulary; and being, in his enquiries, very attentive to the languages of the other islands throughout the South Sea, he has afforded us the amplest proof of their wonderful agreement, or rather identity. This observation has been already made in our history of former voyages, and we shall now strengthen it by a new specimen or fresh list of words; and by placing the corresponding words as used at Otaheite in another column, the reader will be able to judge by what changes the difference of dialect has been effected.

A TABLE of Select Words used in the Islands of
NEW ZEALAND and Otaheite.

NEW ZEALAND.	OTAHEITE.	ENGLISH.
Moenga	Moera	A Bed
Epaïpe	Pepe	Butterfly
Purra, purra	Ere, ere	Black
Makkarcede	Marecede	Cold
Hekace	Ey	To Chew or eat
Wyeroo	Ero	A Dog's tail
Kaoa, matte	Matte, roa	Death, dead
Eoowha	Eooha	A Female
Makoe	Matou	Fish-bone
Ereire	Eraire	To Fly
Reenga	Ereema	A Hand
Ewharre	Ewharre	House
Keerahoi	Erahoi	Large
Tangata	Taata	A Man
Toa	Etoa	Male kind
Woho	Woho	Out, not within
Whairo	Oora, oora,	Red
Nohoanna	Nohonoa	To Reside
Mango	Mao	A Shark
Ka Powhy	Owhy	Stone
Opanee	Opanee	Shut
Moea	Moe	To Sleep
Agooanai	Aooanai	To-day
Geetaia	Eetea	To Understand
Ewy	Evy	Water
Taooa	Taooa	We
Kahaia	Tehaia	Where is he
Ema	Ooama	White
Taennahoi	Ninnahoi	Yesterday
Warre	Ooaro	Forgot
NUMERALS.		
Tahace	Atahay	One
Rooa	Erooa	Two
Toroo	Toroo	Three
Faha	Ahaa	Four
Reema	Erema	Five
Ono	Aono	Six
Hectoo	Aheitoo	Seven
Waroo	Awaroo	Eight
Eeva	Aceva	Nine
Angahoora	Ahooroo	Ten
Ma-tahace	Eleven	
Ma-rooa	Twelve, &c. by prefixing the article Ma.	
Mangahoora	Twenty	Thus

Thus we have mentioned all the particulars that came under our observation, and which we think worth relating, during our intercourse with the New Zealanders: we have only to add some very remarkable information which Captain Cook received from Tawehiarooa. "One day, says the Captain, on inquiring of Tawehiarooa, how many ships such as ours, had ever arrived in Queen Charlotte's Sound, or in any part of its neighbourhood? He began with giving an account of one absolutely unknown to us. This he said had put into a port on the N. W. coast of Teerawitte, but a very few years before I arrived in the Sound in the Endeavour, which the New Zealanders distinguish, by calling Tupia's ship. At first, I thought he might have been mistaken as to the time and place; and that the ship in question might be either Monsieur Surville's, who is said to have touched upon the N. E. coast of Eaheinomauwe, the same year I was there in the Endeavour; or else Monsieur Marion du Fresne's, who was in the Bay of Islands, on the same coast a few years after. But he assured us that he was not mistaken, either as to the time, or as to the place of this ship's arrival; and that it was well known to every body about Queen Charlotte's Sound and Teerawitte. He said, that the Captain of her, during his stay here, cohabited with a woman of the country; and that she had a son by him, now living, and about the age of Kokoa; who, though not born then, seemed to be equally well acquainted with the story. We were also informed by Tawehiarooa, that this ship first introduced the venereal disease among the New Zealanders. It were to be wished, that subsequent visitors from Europe may not have their share of guilt, in leaving so dreadful a remembrance of them among this unhappy race. The disorder now is but too common here; though they do not seem to regard it; saying, that its effects are not near so pernicious at present, as they were at its first appearance. The only method, as far as I ever heard, that they make use of as a remedy, is by giving the patient the use of a sort of hot bath, which they produce by the steam of certain green plants laid over hot stones. I regretted much, that we did not hear of this ship while we were in the Sound, as, by means of Omiah, we might have had full and correct information about her from eye-witnesses. For Tawehiarooa's account was only from what he had been told, and therefore liable to many mistakes. I have not the least doubt, however, that his testimony may so far be depended upon, as to induce us to believe, that a ship really had been at Teerawitte, prior to my arrival in the Endeavour, as it corresponds with what I formerly heard. For in the latter end of 1773, the second time I visited New Zealand, during my former voyage, when we were continually making inquiries about the Adventure, after our separation, some of the natives informed us of a ship's having been in a port on the coast of Teerawitte: but, at that time, we thought we must have misunderstood them, and took no notice of the information. We had another piece of intelligence from him, though not confirmed by our own observations, that there are snakes and lizards in New Zealand of an enormous size. He described the latter as being eight feet in length, and as big round as a man's body. He said that they sometimes seize and devour men; that they burrow in the ground; and that they are killed by making fires at the mouths of the holes. We could not be mistaken as to the animal; for with his own hand he drew a very good representation of a lizard on a piece of paper; as also of a snake, in order to shew what he meant."

In the morning of Tuesday the 25th of February, we left the Sound. By the mean of the results of many astronomical observations, we found the latitude of Ship Cove to be 41 deg. 6 min. S. and the longitude 174 deg. 25 min. 15 sec. E. At ten o'clock, a light breeze springing up at N. W. by W. we made sail through Cook's Strait, with the Discovery in company. On Thursday the 27th, we cleared Cape Palliser, and took our departure from thence. It bore W. distant about seven leagues. We had now a fine gale, and

steered towards N. E. When we had lost sight of land, our two youths from New Zealand, notwithstanding their employment of fishing near the shores from their infancy, began to repent of the adventurous step they had taking. Seeing only foaming billows round them, their hearts failed: they began to pine, and refused to eat. When Captain Clerke with Mr. Burney came on board our ship, they ran and hid themselves, discovering a great panic. It did not appear that their fear took its rise from the thoughts of being carried back, because when the gentlemen returned, they wanted to go with them. It should rather seem, therefore, that they were apprehensive of some design upon their lives, as in their country a consultation amongst the chiefs always precedes a determined murder. This was confirmed by their behaviour afterwards. We endeavoured, as far as lay in our power, to soothe them; but they wept continually, and gave vent to their sorrows in a kind of song, which seemed to express their praises of their country and people, from which they were, now, in all probability to be forever separated. In this dispirited state they continued for several days, till, at length, the agitation of their minds began to subside, and their sea sickness, which had aggravated their grief, wore off. Their lamentations then became less and less frequent; their native country, their kindred, and friends, were gradually forgotten, and they appeared to be firmly attached to us. On the 28th, at noon, in the lat. of 41 deg. 17 min. S. longitude 177 deg. 17 min. E. we tacked about and stood to the S. E. with a gentle breeze at E. N. E. which afterwards veered to the N. E. in which point the wind remained two days, sometimes blowing a fresh gale, with squalls and rain.

Monday, March the 1st, a storm came on, but as the wind was fair, we got down the top-gallant-yards, close reefed the top-sails, and pursued our course E. by N. On the 2nd, it shifted to N. W. and afterwards to S. W. between which point and the N. it continued to blow, sometimes very moderately, and at other times a strong gale. With this wind we steered N. E. by E. and E. with all the sail we could carry till Tuesday the 11th, when it veered to N. E. and S. E. at which time we observed at noon in lat. 39 deg. 29 min. long. 196 deg. 4 min. E. On the 15th, being Saturday, it blew a hurricane, attended with rain and a high sea, which breaking over our bows, cleared the decks of every thing that was not firmly secured, and split the fore-top-mast stay of the Discovery into a thousand shivers. At night we shifted our course and stood N. by E. half E. There were some on board the Discovery who disapproved of the course we had hitherto steered, foreseeing, that by going so fast to the northward, we should fall too suddenly into the trade winds, especially, if we should be met by an easterly wind before we approached the Tropic. Among the seamen on board a king's ship, there are always some expert navigators, whose judgment, ripened by experience, is much to be depended upon; but the misfortune is, that these men are never consulted, nor do they even dare so much as to whisper their opinion to their superior officer. Like gamesters standing by, they can see the errors of the game, but must not point them out till the game is over. This we find, by the journal before us, was the real case on board the Discovery, some of whose people did not scruple to foretell what would happen after we had left the 39th degree of southern latitude, while we were yet only in the 196th deg. of eastern longitude. They did not scruple to say that before we altered our latitude to the N. we ought to have stretched 13 or 14 deg. farther eastward of our intended port; and in this case when we came to pass the tropic, we should be sure of a fair wind to carry us to it. On Tuesday, the 18th, having continued our course N. N. E. for the last 24 hours, we found ourselves, by observation, in lat. 33 deg. 8 min. and in long. 200 deg. E. that is, more than 12 deg. to the westward of Otaheite. Here we saw sea weed in abundance, and by a large tree floating by us, we judged that we could not be far from land. The tree appeared to

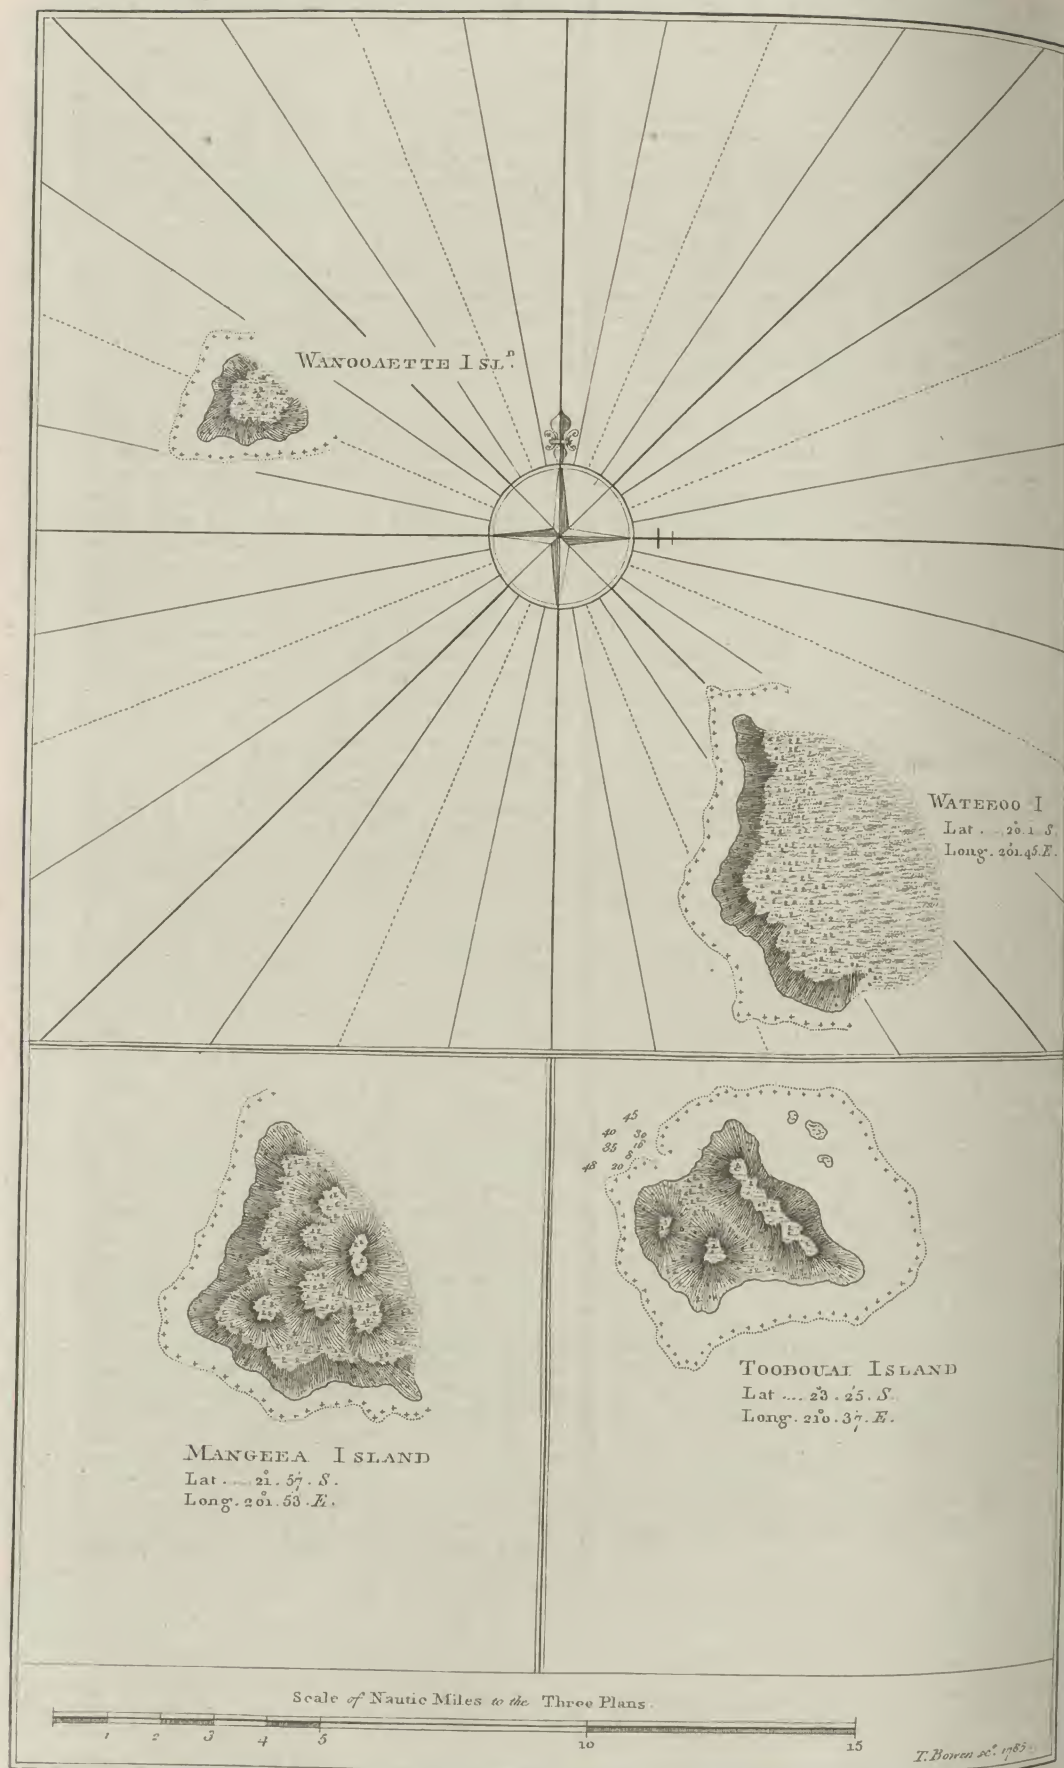

be about 30 feet in girth, and by its freshness seemed to have been no long time in the water. Saturday the 22nd, the heaviest rain began to pour down that the oldest mariner, in either of the ships, had ever experienced. It fell in sheets, and, as the wind increased, the men in handling the sails, were in the utmost danger of being washed off the yards. It continued for six hours incessantly; however, most seasonably for our people in the *Resolution*, where the number of live stock, as horses, cows, goats, and sheep, had exhausted a large proportion of our fresh water, and we were yet at a great distance from our destined port. Here the wind began to veer to the E. which had been apprehended by many; who finding our longitude not to increase in proportion as our latitude decreased, began to suspect we should not make Otaheite this run.

Monday, the 24th, our latitude was decreased to 24 deg. 24 min. and our longitude only increased one single degree. The wind was E. by S. and our course still N. by E. we made consequently but little way. To add to our vexation, we were now in an alarming situation, for want of provisions and water for the live stock; inasmuch, that we were obliged to kill part of our sheep and hogs, not having a sufficient quantity of water to keep them alive. As to the horses, and cows, they were mere skeletons; having been reduced to the scanty portion of 4 pounds of hay, and 6 quarts of water for 24 hours; and the men were put to the allowance of two quarts of water, for the same space of time. The wind continuing foul, all hope of reaching Otaheite was laid aside; and the isles of Amsterdam and Rotterdam, were at this time thought to be our only resource. Hitherto not a man was ill on board the *Discovery*, nor was any alteration made in her company's allowance, they not having any more cattle on board, than were necessary for the ship's use. Thursday the 27th, we crossed the Tropic. The weather, which for two or three days had been squally, attended with thunder and lightning, increased to a storm; and we now began to be surrounded by our tropical companions. On the 28th, the weather cleared up, and we were saluted with a fine breeze, and attended by numerous shoals of flying fish, bonitos, dolphins, sharks, and whole flocks of tropical sea fowl, which abound near the islands in the low latitudes, but are seldom seen in the deep Pacific Ocean. On the 29th, at ten o'clock A. M. as we were standing to the N. E. the *Discovery* made the signal for seeing land, distant seven leagues. We tacked ship and stood for it till the evening. While day-light remained we saw no signs of inhabitants, but, in the night observed several fires. On Sunday the 30th, at day break we discovered it to be an island of no great extent, and bore up on the west-side. We now saw several people wading to the reef, but, observing the ships leaving them quickly, they remained there. But others, who soon appeared, followed our course; and some of them assembled in small bodies, making great shouts. Upon our nearer approach to the shore, we saw many of the natives running along the beach, and, by the assistance of our glasses, could perceive, that they were armed with long spears and clubs, which they brandished in the air with signs of threatening, or, as some of us supposed, with invitations to land. Most of them were without cloaths, except having a kind of girdle, which was brought up between their thighs; but some of them wore about their shoulders pieces of cloth of various colours, white striped, or chequered; and almost all of them had about their heads a white wrapper, in some respects resembling a turban. They were of a tawny

complexion, well made, robust, and of a middling stature. A small canoe was now launched from the most distant part of the beach, and a man getting into it, put off, as with a view of reaching the ship; but his courage failing him, he hastily put back. On his return to the beach another man joined him in the canoe, and then both of them paddled towards us. They seemed, however, afraid to approach, till their apprehensions were removed by Omiah, who addressed them in the language of Otaheite. Thus encouraged, they came near enough to receive some nails and beads, which, being tied to some wood, were thrown into the canoe. They, however, put the wood aside without untying the string, which perhaps might have proceeded from superstition; for we were informed by Omiah, that when they observed us offering presents to them, they requested something for their Eatooa. On Omiah's asking them, whether they eat human flesh, they replied in the negative, with equal abhorrence and detestation. One of them, named Mouroua, being questioned with regard to a scar on his forehead, said, it was the consequence of a wound he had received in fighting with the natives of an island lying towards the N. E. who sometimes invaded them. They afterwards laid hands on a rope, but would not venture on board, telling Omiah, that their countrymen on shore had suggested to them this caution; and had likewise directed them to enquire whence our ship came, and to procure information of the name of the Captain. Their chief, they said, was called Orooeeka. When we demanded the name of the island, they told us it was Mangya, or Mangea, to which they sometimes added nooe, nai, naiwa. The features of Mouroua were agreeable, and his disposition, to all appearance, no less so; for he exhibited some droll gesticulations, which indicated humour and good nature. He also made others of a serious kind, and repeated some words with an air of devotion, before he would venture to take hold of the rope at the stern of the ship. He was lusty and well made, though not tall. His complexion was nearly of the same cast with that of the natives of the most southern parts of Europe. His companion was not so handsome. They both had strong, straight, black hair, tied together on the top of their heads with a piece of white cloth. They had long beards; and the inside of their arms, from the elbow to the shoulders, and some other parts, were tattooed, or punctured. The lobe of their ears was slit to such a length, that one of them stuck there a knife, and some beads we had given him. The same person had hung about his neck, by way of ornament, two polished pearl-shells, and a bunch of human hair, loosely twisted together. They wore a kind of girdles, which we found were a substance manufactured from the *morus papyrifera*, and glazed like those used in the Friendly Islands. They had on their feet a sort of sandals, made of a grassy substance interwoven, which we perceived were also worn by those whom we had seen on the beach. The canoe in which they came was the only one we saw. It was very narrow, and not more than ten feet long, but strong, and neatly made. The lower part was of white wood; but the upper part was black, and their paddles were of the same colour. These were broad at one end, blunted, and about three feet long. The fore part had a flat board fastened over it, which projected out, to prevent the water from getting in. It had an upright stern, five feet high, which terminated at the top in a kind of fork. They paddled indifferently either end of the canoe forward.

THE HISTORY OF THE CITY OF LONDON, FROM THE FOUNDATION OF THE CITY, TO THE PRESENT TIME, IN TWO VOLUMES. VOL. II. CONTAINING THE HISTORY OF THE CITY, FROM THE REIGN OF EDWARD THE FIRST, TO THE PRESENT TIME. BY JOHN STOW, AN Eminent Antiquary, and one of the most Learned Men of his Age. C H A P. IV.

An attempt made to land on the Island of Mangeea, which we were obliged to leave unvisited—Observations on the coast—Transactions with the natives—Description of the Island and its inhabitants—Specimen of their language—The Resolution and Discovery continue their course northward—Discover another island, named Wateeo—Visits from the natives—An account of their persons and dress—The coast explored—Lieutenants Gore and Burney, Mr. Anderson and Omiah sent on shore—An account of their reception—They are introduced to three Chiefs—A dance of twenty young women—Omiah's apprehension of being roasted—The islanders send provisions on board—Further description of the natives—Of their double canoes—Trees and plants—Omiah's expedient to prevent being detained on shore—He meets with three of his countrymen—An account of their distressful voyage—Additional remarks relative to Wateeo—Otakootaia visited, and Harvey's Island—A fruitless attempt made to land—The two ships bear away for the Friendly Isles—Palmerston's Island touched at—Two islets described—Refreshments procured—Arrive at the Friendly Islands—Intercourse with the natives of Komango—Arrival at Annamooka—Transactions and incidents there—An account of Annamooka—The Resolution and Discovery proceed to Hapae.

AS soon as the ships were in a proper station, about ten o'clock A. M. of the 30th, two boats were sent out to endeavour to find a convenient place for landing. Captain Cook had no sooner put off in his own boat, than the two men approached with their canoe, and when along side of the boat Mouroua, without hesitation, stepped into her. Omiah, who was with the Captain, was desired to enquire of Mouroua, where we could land; upon which he directed us to two places. But we soon perceived, with regret, that the attempt at either was impracticable, on account of the surf, unless at the risque of having our boats destroyed. Nor were we more successful in our search for anchorage, as we could find no bottom within a cable's length of the breakers, where we met with from forty to twenty fathoms depth, over sharp rocks of coral. While we thus reconnoitred the shore of Mangeea, the natives thronged down upon the reef all armed. Mouroua, who still remained in the boat with captain Cook, thinking, perhaps, that this warlike appearance deterred us from landing, commanded them to retire. As many of them complied, we imagined, that he was a person of some consequence: indeed, if we did not misunderstand him, he was brother to the king of the island. Several of them, instigated by curiosity swam from the shore to the boats, and came on board them without reserve. We even found some difficulty in keeping them out, and could scarce prevent their pilfering whatever was within their reach. At length, when they observed us returning to the ships, they all left us except Mouroua, who, though not without manifest indications of fear, accompanied the Commodore on board the Resolution. The cattle, and other new objects that he saw, did not strike him with much surprize; his mind, perhaps, being too much occupied about his own safety, to allow him to attend to other things. He seemed very uneasy, and gave us but little new intelligence: and, therefore, after he had continued a short time on board, a boat was ordered to carry him towards the land. In his way from the cabin, happening to stumble over one of the goats, he stopped, looked at the animal, and asked Omiah, what bird it was? But not receiving an immediate answer, he repeated the question to some of the people who were upon the deck. The boat having conveyed him near the surf, he leaped into the water, and swam ashore. His countrymen eager to learn from him what he had seen, flocked round him as soon as he had landed; in which situation they remained when we lost sight of them. We hoisted in the boat as soon as she returned, and made sail to the northward. Thus were we obliged to leave this fine island unvisited, which seemed capable of supplying all our wants. It is situated in lat. 21 deg. 57 min. S. long. 201 deg. 53 min. E.

This island of Mangeea made a most delightful appearance; it may therefore easily be conceived with what reluctance we left it. Those parts of its coast which fell under our observation, are guarded by a reef of coral rock, against which a heavy surf is continually breaking. The island is about five leagues

in circumference, and though of a moderate and pretty equal height, may be seen in clear weather at the distance of more than ten leagues. In the interior parts, it rises into small hills, whence there is an easy descent to the shore, which, in the S. W. part, is steep, though not very high, and has several cavities made by the dashing of the waves against a brownish sand-stone, of which it consists. The descent here abounds with trees of a deep green, which seem to be all of one sort, except nearest the shore, where we observed numbers of that species of dracæna, found in the woods of New Zealand. The shore on the N. W. part, terminates in a sandy beach, beyond which the land is broken into small chafms, and has a broad border of trees, resembling tall willows. Farther up, on the ascent, the trees were of the deep green above mentioned, which some of us imagined to be the rima, intermixed with cocoa-palms, and a few other sorts. Some trees of a higher sort were thinly scattered on the hills, the other parts of which were covered with somewhat like fern, or were bare, and of a reddish colour. The island upon the whole, has a pleasing appearance, and might, by proper cultivation, be made a beautiful spot. The natives appearing to be both numerous and well fed, it is highly probable, that such articles of provision as the island produces are found in great abundance: Our friend Mouroua informed us, that they had no hogs nor dogs, though they had heard of both those animals, but that they had plantains, taro, and bread-fruit. The only birds we observed, were some terns, noddies, white egg-birds, and white herons.

The inhabitants of this island resemble those of Otaheite and the Marquesas in the beauty of their persons; and their general disposition seems also to correspond with that of the first mentioned people; for they are not only lively and chearful, but are acquainted with all the lascivious gesticulations practiced by the Otaheiteans in their dances. We had likewise reason to suppose, that they have a similar method of living: for though we had not an opportunity of seeing many of their habitations, we observed one house near the beach which in its mode of construction, differed little from those of Otaheite. It appeared to be seven feet high, and thirty in length, with an open end, which represented an ellipsis, or oval, transversely divided. It was pleasantly situated in a grove. These people salute strangers by joining noses, and taking the hand of the person whom they accost, which they rub with some force upon their mouth and nose. It is worthy of remark, that the inhabitants of the Palaos, New Philippine, or rather Caroline Islands, though at the distance of near 1500 leagues from Mangeea, have a similar method of salutation. The language of the natives of Mangeea is a dialect of that spoken at Otaheite, as will appear by the following list of words, selected by the assistance of Omiah. The agreement between them as to the orthography is very striking; but their pronunciation in Mangeea, like that of the New Zealanders, is rather more guttural than that of Otaheite.

A LIST.

A List of words used in Mangeea, and compared with others used at Otaheite, taken from Omiah by Mr. Anderson.

MANGEEA.	OTAHEITE.	ENGLISH.
Kooroo	Ooroo	Bread-fruit.
Ewakka	Evaa	A Canoe.
Ereekee	Eree	A Chief.
Pooroohee	—	A Club.
Taia, taia aoutee	Eoute	Cloth or cloth-plant.
Eakkaree	Aree	A Cocoa-nut.
Maheine	Maheine	A Dangler.
Naoo, mou	—	Friend.
Etamagee	Tamace	A Fight, or battle.
Mata	Myty	Good.
Manna	—	Great, or powerful.
Ereekee, manna	—	A Powerful chief.
Ou	Wou	I.
Ooma	—	To Kiss.
Taata, or Tangata	Taata	A Man.
Aoure	Aoure	No.
Heyhey	—	A Spear.
Euta	Euta	The Shore.
Heetaia matooa	—	The Sun.
Waheine	Waheine	A Woman.
Oo	—	There.
Ehataiee	Owytaiccoa	What is that?
Ace	Ai	Yes.

Having taken our departure from Mangeea, we held on our course northward, till noon of Monday the 31st, when the man at the mast-head called out land, which was soon answered by a signal from the Discovery. It lay in the direction of N. E. by N. distant 10 leagues. The next morning, being Tuesday the 1st of April, we were abreast of its north-end, and within four leagues of it. It now had the appearance of an island, nearly of the same extent with that which we had left. Another island, much smaller, was also descried right a-head. Though we could soon have reached this, we preferred the larger one, as being most likely to furnish food for our cattle. We therefore made sail for it; but there being little wind, and that unfavourable, we were still two leagues to leeward, at eight o'clock the succeeding morning. Soon after three armed boats were dispatched, and one from the Discovery, under the command of Lieutenant Gore, in search of a landing-place, and good anchoring-ground. Mean while we plied up under the island with the ships. As our boats were putting off, we saw several canoes coming from the shore, which repaired first to the Discovery, she being the nearest to it. Not long after, three of these canoes came along-side our ship, the Resolution. They are long and narrow, and are supported by outriggers: the head is flat above, but prow-like below; and the stern is about four feet high. We bestowed on our visitors some knives, beads, and other trifles; and they gave us some cocoa-nuts, in consequence of our having asked for them; but they did not part with them by way of exchange, as they seemed to have no idea of barter or traffic. One of the natives, after a little persuasion came on board; and two others soon followed his example. They appeared to be perfectly at their ease, and free from all uneasy apprehensions. After their departure, a man arrived in another canoe, bringing a bunch of plantains as a present to our captain, who gave him in return, a piece of red cloth, and an axe. We were afterwards informed by Omiah, that this present had been sent from the king of the island. Soon after, a double canoe, containing twelve of the islanders, came towards us. On approaching the ship, they recited some words in concert, by way of chorus, one of them first giving the word before each repetition. Having finished this solemn chant, they came along-side, and asked for the chief. As soon as Captain Cook had made his appearance, a pig and some cocoa-nuts were conveyed into the ship; and the captain was also presented with a piece of matting, by the principal person in the canoe, when he and his companions had got on board. These new visitors

were introduced into the cabin, and other parts of the ship. Though some objects seemed to surprize them, nothing could fix their attention. They were afraid to venture near the cows and horses, of whose nature they could form no conception. As for the sheep and goats, they gave us to understand, that they knew them to be birds. It may appear rather incredible, that human ignorance could ever make so ridiculous a mistake, there not being the smallest resemblance between any winged animal and a sheep or goat. But these people seemed unacquainted with the existence of any other terrestrial animals than hogs, dogs, and birds; and seeing our goats and sheep to be very different from the two former, they inferred absurdly, that they must belong to the latter class, in which they knew there were a great variety of species. Though Captain Cook bestowed on his new friend what he supposed would be the most acceptable present, yet he seemed somewhat disappointed. We were afterwards informed, that he eagerly wished to procure a dog, of which kind of animals this island was destitute, though the natives knew that the race existed in other islands of the Pacific Ocean. Captain Clerke had received a similar present, with the same view, from another man, who was equally disappointed in his expectations.

The islanders, whom we had seen in those canoes, were, in general, of the middling stature, and not unlike the Mangreens. Their hair either flowed loosely over their shoulders, or was tied on the crown of the head; and though in some it was frizzled, yet that, as well as the straight sort, was long. Some of the young men were handsome. Like the inhabitants of Mangeea, they wore girdles of glazed cloth, or fine matting, the ends of which were brought between their thighs. Their ears were bored, and they wore about their necks, by way of ornament, a sort of broad girds, stained with red, and strung with berries of the night-shade. Many of them were curiously marked or tattooed from the middle downwards, particularly upon their legs; which made them appear as if they wore boots. Their beards were long, and they had a kind of sandals on their feet. They were frank and cheerful in their deportment, very friendly, and good-natured. Lieutenant Gore returned from his excursion, and informed Captain Cook, that he had examined the west-side of the island, without being able to find a place where a ship could ride in safety, or a boat could land, the shore being bounded by a steep coral rock, against which a continual surf broke with extraordinary violence. But as the inhabitants seemed extremely friendly, and as desirous of our landing as we ourselves were, Mr. Gore was of opinion, that they might be prevailed upon to bring off to the boats beyond the surf, such articles as we were most in need of. As we had little or no wind, the delay of a day or two was of no great consequence, and therefore it was resolved to try the experiment the next morning: soon after day break some canoes came towards the ships, one of which directed its course to the Resolution. There were in it some cocoa-nuts, plantains, and a hog, for which the natives demanded from us a dog, refusing every other thing we offered by way of exchange. Though one of our gentlemen on board had a dog and bitch, which were great nuisances in the ship, and which might have served to propagate a race of troublesome animals in this island, yet he could not be prevailed upon to part with them. However, to gratify these people, Omiah gave them a favourite dog he had brought with him from England, with which acquiescence they were highly pleased.

Thursday the 3d of April, at ten o'clock A. M. Lieutenant Gore was dispatched with three boats, to make trial of the experiment which that officer had proposed. Two of the natives, who had been on board, accompanied him; and Omiah served as an interpreter. The ships being a full league from the island when the boats put off, and the wind being inconsiderable, it was twelve o'clock before we could work up to it. We then perceived our three boats just without the surf, and an amazing number of the islanders on the shore, abreast of them. Concluding from this, that Lieu-

tenant Gore, and others of our people had landed, we were impatient to know the event. With a view of observing their motions, and being ready to afford them such assistance as they might occasionally require, we kept as near the shore as was consistent with prudence. We were convinced, however, that the reef was a very effectual barrier between us and our friends who had landed, and put them completely out of the reach of our protection. But the natives, in all probability, were not so sensible of this circumstance as we were. Some of them now and then brought a few cocoa-nuts to the ships, and exchanged them for whatever was offered them. These occasional visits diminished the Captain's solicitude about our people who had landed; for, though we could procure no intelligence from our visitors, yet their venturing aboard seemed to imply, that their countrymen on shore had made no improper use of the confidence reposed in them. At length towards the evening, we had the satisfaction of seeing the boats return. When our people got on board, we found that Mr. Gore, Mr. Anderson, Mr. Burney, and Omiah, were the only persons who had landed. The occurrences of the day were now fully reported to Captain Cook by Mr. Gore. Mr. Anderson's account of their transactions, which was very circumstantial, and including some observations on the island, and its inhabitants, was to the following purport.

They rowed towards a sandy beach, where a great number of natives had assembled, and came to an anchor at the distance of a hundred yards from the reef. Several of the islanders swam off, bringing cocoa-nuts with them; and Omiah gave them to understand, that our people were desirous of landing. Soon after two canoes came off; and to inspire the natives with a greater confidence, Mr. Gore and his companions resolved to go unarmed. Mr. Anderson and Lieutenant Burney went in one canoe, a little before the other; and their conductors watching with great attention the motions of the surf, landed them safely on the reef. A native took hold of each of them, with a view of supporting them in walking over the rugged rocks to the beach, where several others, holding in their hands the green boughs of a species of *mimosa*, met them, and saluted them by the junction of noses. They were conducted from the beach amidst a vast multitude of people, who flocked around them with the most eager curiosity; and being led up an avenue of cocoa-palms, soon came to a number of men, arranged in two rows, and armed with clubs. Proceeding onward among these, they found a person who appeared to be a chief, sitting cross-legged on the ground, and cooling himself with a kind of triangular fan, made from the leaf of the cocoa-palm, with a polished handle of black wood. He wore in his ears large bunches of beautiful feathers of a red colour, but had no other mark to distinguish him from the rest of the people. Our two countrymen having saluted him as he sat, marched on among the men armed with clubs, and came to a second chief, adorned like the former, and occupied like him, in fanning himself. He was remarkable for his size and corpulence, though he did not appear to be above thirty years of age. They were conducted in the same manner to a third chief, who seemed older than the two former: he also was sitting, and was ornamented with red feathers. After they had saluted him as they had done the others, he desired them both to sit down, which they willingly consented to, being greatly fatigued with walking, and with the extreme heat they felt amidst the surrounding multitude.

The people being ordered to separate, our two gentlemen saw, at a small distance, twenty young women, adorned, like the chiefs, in red feathers, engaged in a dance, which they performed to a slow and solemn air, sung by them all. The gentlemen rose up, and walked forward to see those dancers, who, without paying them the smallest attention, still continued their dance. They seemed to be directed by a man, who, in the capacity of a prompter, mentioned the several motions they were to make. They never changed the spot, as Europeans do in dancing, and though

their feet were not entirely at rest, this exercise consisted more in moving their fingers very nimbly, holding their hands, at the same time, in a prone position, near the face, and occasionally clapping them together. Their dances and singing are performed in the exactest concert, and the former bear a great resemblance to those of the natives of the Caroline Islands. The young women had probably been instructed with extraordinary care, and selected for this ceremony, being superior in beauty to most of those who were in the crowd. They were in general, rather stout, and of an olive complexion, with black hair flowing in ringlets down their necks. Their shape and limbs were elegantly formed; for their dress consisting only of a piece of glazed cloth tied round the waist, which scarcely reached so low as the knees, our gentlemen had an opportunity of examining almost every part. Their features were rather too full to constitute a perfect beauty. Their eyes were of a deep black, and their countenances expressed a great degree of modesty and complacency. Before these beautiful females had finished their dance, a noise was heard as if some horses had been galloping towards our gentlemen; and on turning their eyes aside, they saw the people armed with clubs, who had been desired to entertain them, as they supposed, with an exhibition of their manner of fighting; which they did, one party pursuing another, who ran away.

At this time Lieutenant Burney and Mr. Anderson began to look about for Mr. Gore and Omiah, whom they at length perceived coming up, having been as much incommoded by the crowds of people as they themselves had been, and introduced in the same manner to the three chiefs; the names of whom were Otteroo, Taroa, and Fatowweera. Each of these exacting a present, Mr. Gore gave them such things as he had brought with him for that purpose; after which he informed the chiefs of his views in coming ashore, but was desired to wait till the next day before he should have what he wanted. They now endeavoured to separate our gentlemen from each other, every one of whom had his respective circle to surround, and gaze at him. Mr. Anderson was, at one time, upwards of an hour apart from his friends; and when he told the chief, who was near him, that he wished to speak to Omiah, his request was peremptorily refused. At the same time he found that those near him pilfered several trifling things which were in his pocket; and on his complaining of this treatment to the chief, he justified their behaviour. From these circumstances Mr. Anderson began to apprehend, that they designed to detain our party among them. In this situation he asked for something to eat; upon which they brought him some cocoa-nuts, bread-fruit, and a sort of sour pudding; and when he complained of the heat, occasioned by the multitude of people, the chief himself condescended to fan him. Mr. Burney going to the place where Mr. Anderson was, the latter informed him of his suspicions; and to try whether they were well founded or not, they both attempted to get to the beach; upon which they were soon stopped by some of the natives, who said they must return to the place which they had left. On their coming up they found Omiah under the same apprehensions; but he had, as he imagined, an additional motive of terror; for, having observed, that they had dug a hole in the ground for an oven, which they were now heating, he could assign no other reason for it, than that they intended to roast and devour our people; he went even so far as to ask them, whether that was their intention; at which they were much surprized, asking, in return, whether that custom prevailed among us.

Thus were Mr. Anderson and the others detained the greatest part of the day, being sometimes separated, and sometimes together; but continually in a crowd, who desired them frequently to uncover parts of their skin, the sight of which struck the islanders with admiration. They, at the same time, rifled the pockets of our gentlemen; and one of them snatched from Mr. Gore a bayonet, which hung by his side. This being represented to one of the chiefs, he pretended to send a person in search of it,

but probably countenanced the theft; for Omiah; soon after, had a dagger stolen from his side in the same manner. They now brought some green boughs as emblems of friendship, and sticking the ends of them in the ground, desired our party would hold them as they sat, giving them to understand, that they must stay and eat with them. The sight of a pig lying near the oven, which they had heated, removed Omiah's apprehensions of being put into it himself, and made him think, that it might be intended as a repast for him and his companions. The chief also sent some of his people to provide food for the cattle, and they returned with a few plantain trees, which they conveyed to the boats. In the mean time, Mr. Burney, and Mr. Anderson made a second attempt to get to the beach; but on their arrival, they found themselves watched by people who seemed to have been stationed there for that purpose; for when Mr. Anderson endeavoured to wade in upon the reef, one of them dragged him back by his clothes. They also insisted upon his throwing down some pieces of coral that he had picked up, and on his refusing to comply, took them from him by force: nor would they suffer him to retain some small plants which he had gathered. They likewise took a fan from Mr. Burney, who, on his coming ashore had received it as a present. Finding that obedience to their will was the only method of procuring better treatment, the gentlemen returned to the place they had quitted; whereupon the natives promised, that after they had partaken of a repast, that had been prepared for them, they should be furnished with a canoe to carry them off to their boats. Accordingly, the second chief to whom they had been presented, having seated himself on a low stool, and directed the multitude to form a large ring, made them sit down by him. A number of cocoa-nuts were now brought, with a quantity of baked plantains, and a piece of the pig that had been dressed, was placed before each of them. Their fatigue, however, had taken away their appetites; nevertheless they eat a little to please their entertainers. When this meal was finished, Omiah, Mr. Gore's interpreter, was questioned by the natives concerning us, our country, our ships and arms. In answer to which, among other particulars, he told them, that our country had ships as large as their island, on board of which were implements of war (describing our guns) of such dimensions, as to contain several people within them; one of which could demolish the island at one shot. As to the guns in our two ships, he acknowledged that they were but small in comparison with the former; yet even with these, he said, we could with great ease, at a considerable distance destroy the island, and every soul in it. On their enquiring by what means this could be done, Omiah produced some cartridges from his pocket, and having submitted to inspection the balls, and the gun-powder by which they were to be set in motion, he disposed the latter upon the ground, and by means of a piece of lighted wood, set it on fire. The sudden blast, the mingled flame and smoke, that succeeded instantaneously, filled the natives with such astonishment, that they no longer doubted the formidable power of our weapons: and had it not been for the terrible ideas they entertained of the guns of our ships, from this specimen of the mode of their operation, it was imagined that they would have detained the gentlemen the whole night; for Omiah assured them, that, if he and his friends did not return on board the same day, they might expect, that our Commander, captain Cook, would fire upon the island. It was now near sun-set, when the islanders sent down to the beach the remainder of the provisions that had been dressed, to be carried to the ships; soon after which our gentlemen found a canoe prepared to put them off to their boats, which the natives did with great caution; but as they were pushing the canoe into the surf, one of them snatched a bag out of her, which contained a pocket-pistol belonging to Mr. Anderson, who calling out to the thief with marks of the highest displeasure, he swam back to the canoe with the bag. The islanders then put them on board the boats, with the cocoa-nuts,

plantains, and other provisions; and they immediately rowed back to the ships.

The restrained situation of these gentlemen gave them very little opportunity of observing the country; for they were seldom a hundred yards from the place where they had been introduced to the chiefs, and, consequently, were confined to a few surrounding objects. The first thing that attracted their notice was the number of people, which must have been at least two thousand. Except a few, those who had come on board the ships, were all of an inferior class; for a great number of those that our gentlemen met with on shore, had a superior dignity of demeanour, and their complexion was much whiter. In general, they had their hair, which is long and black, tied on the crown of the head. Many of the young men were perfect models in shape, and of a delicate complexion. The old men were, many of them, corpulent; and they, as well as the young, had a remarkable smoothness of skin. Their general dress consisted of a piece of cloth wrapped about the waist, but some had pieces of mats, most curiously variegated with black and white, formed into a kind of jacket without sleeves; while others wore conical caps made of the core of a cocoa-nut, interwoven with beads. In their ears, which were pierced, they hung pieces of the membranous part of some plant, or stuck there some odoriferous flower. The chiefs, and other persons of rank, had two little balls, with a common base, made of bone; which they hung round their necks with small cords. Red feathers are considered in this island as a particular mark of distinction; for none but the chiefs, and the young women who danced, assumed them. Some of the men were punctured all over their sides and backs, and some of the women had the same ornament (if it deserves that name) on their legs. The elderly women had their hair cropped short, and many of them were cut all over the fore part of the body in oblique lines. The wife of a chief appeared with her child, laid in a piece of red cloth, which had been presented to her husband: she suckled the infant much after the manner of our women. Another chief introduced his daughter, who was young, beautiful, and modest. No personal deformities were observed in either sex, except a few individuals, who had scars of broad ulcers remaining on the face and other parts. Many of the natives were armed with spears and clubs, the latter of which were generally about six feet long, made of a hard black wood neatly polished. The spears were formed of the same wood, simply pointed, and were in general twelve feet long; but some were so short as to seem intended for darts. They preserved their canoes from the sun under the shade of various trees. Mr. Anderson saw eight or ten of them all double ones; that is, two single ones lashed together by rafters laid across. They were about four feet deep, and in length about twenty feet, and the sides were rounded with a plank raised on them. Two of these canoes were curiously stained all over with black, in numberless small figures, as triangles, squares, &c. and were far superior to any thing of the kind Mr. Anderson had ever seen at any other island in the South Sea. The paddles were almost elliptical, and about four feet long. Most of the trees observed by Mr. Anderson were cocoa-palms, some species of hibiscus; a sort of euphorbia; and many of the same kind he had seen at Mangaea. The latter are tall and slender, resembling a cypress; and are called by the natives etoa. This gentleman saw also a species of convolvulus, and some treacle-mustard; besides which there are doubtless other plants and fruit-trees, which he had not an opportunity of seeing. The soil, towards the sea, is nothing more than a bank of coral, generally steep and rugged, which, though it has probably been for many centuries exposed to the weather, has suffered no further change than becoming black on its surface. The reef or rock, with which the shore is lined, runs to different breadths into the sea, where it resembles a high steep wall: it is of a brownish colour, and nearly even with the surface of the water; and though its texture is rather porous,

it is capable of withstanding the washing of the surf, which constantly breaks upon it.

Though this island had never before been visited by Europeans, there were other strangers now residing in it; and it was entirely owing to Omiah's accompanying Mr. Gore, that this remarkable circumstance came to our knowledge. He had scarcely landed on the beach, when he found, among the crowd, three of his own countrymen, natives of the Society Isles. At the distance of about two hundred leagues from those islands, an immense ocean intervening, with such miserable sea-boats as their inhabitants make use of, such a meeting, at such a place, so accidentally visited by us, may be considered as one of those extraordinary and unexpected situations, which strike a curious observer with wonder and amazement. The mutual surprise and pleasure with which Omiah and his countrymen engaged in conversation, may easily be imagined. All were equally impatient; they to hear Omiah's adventures, and Omiah to know theirs. Their story, as related by themselves, is a very affecting one. They said, that about twenty persons, male and female, had embarked in a canoe at Otaheite, with an intention of crossing over to Ulietea; but they were prevented by contrary winds from reaching the latter, or returning to the former island. A dreadful tempest drove them into the main ocean, and the sea, continuing to run mountains high, washed overboard some of the women and children, who perished before they experienced any further distress: that, after three days, when the storm abated, those who remained found themselves in an unknown ocean, with little more provisions than were necessary to serve them a very short time: that, having no pilot to direct their course, they continued to go before the wind day after day; and, their stock of provisions being exhausted, they suffered inconceivable hardships: that, their number gradually diminished, worn out by famine and fatigue: that, those who survived had nothing but the sea-weed which they found floating in the sea, and the water which they saved when it rained, to keep them alive: that, ten days having elapsed, and no land in sight, despair took place of hope, and several, unable to support the pangs of hunger, jumped overboard in their phrenzy, and perished by an easier death; and the groans of the dying, and the terrible agonies with which some were affected before death came to their relief, exceeded all description. In this melancholy situation they had existed for thirteen days, and how much longer they could have no recollection, for they were taken up insensible of pain, and hardly to be distinguished from the emaciated bodies of the dead among whom they were found, seemingly without life or motion, till by the friendly care of their deliverers they were restored. When they were recovered, they said, it was like waking from a dream: they knew not where they were, nor how they came upon land; but being told they were taken up at sea, and in what condition, as their senses gradually returned, they by degrees recollected all the circumstances already related: they added, that ever since they were brought to life, they had remained with their deliverers, and were now quite reconciled to their condition, and happy in the situation in which the Etooa, or good spirit, had placed them. Four men had survived, one of whom had since died; and the names of the three, now living, are Tavee, Otirreroa, and Orououte; the former was born at Huaheine, the second at Ulietea, and the latter at Otaheite. Omiah, after hearing their relation, with which he was apparently much affected, told them, that they might now take the opportunity of returning home with him; that he would intercede for them, and that he was sure, if they chose it, the chiefs of the expedition would grant his request. They thanked Omiah for his kindness; nor had they any reason to suppose, that such an offer would ever be made them again; but they were now determined to end their days with the people who had restored them to second life; and as their dearest relations and friends were of the number of those who perished, the return to their native country would only renew their grief, and instead of affording them pleasure, would increase

their melancholy. The application of this narrative is obvious. It will serve to explain, in a more satisfactory manner than the flimsy conjectures of speculative reasoners, how the detached parts of the world, and, in particular, the islands of the Pacific Ocean, may have been first peopled; those especially that lie at a considerable distance from each other, or from any inhabited parts of a continent. Such accidents as the above related, probably happen frequently in the great Pacific Ocean. In 1696, two canoes, having on board thirty persons of both sexes, were driven, by contrary winds and tempestuous weather, on the Isle of Samal, one of the Philippines, after having been tossed about at sea seventy days, and having performed a voyage, from an island, called by them Amorfor, 300 leagues to the East of Samal. Five of the number who embarked, died of the hardships suffered during this extraordinary passage. In 1721, two canoes, one containing 24, the other 6 persons, men, women, and children, were driven from an island, they called Farroilep, northward, to the Isle of Guam, one of the Ladrões, or Mariannes: but these had not sailed so far as their countrymen, who reached Samal, as above, and they had been at sea only 20 days. There seems to be no reason to doubt the authenticity of these two relations. The information contained in the letters of the Jesuits, about these islands, now known under the name of the Carolines, and discovered to the Spaniards by the arrival of the canoes at Samal and Guam, has been adopted by all our later writers.

The natives of this island call it Watecoo. It is situated in the lat. of 20 deg. 1 min. S. and in the long. of 201 deg. 45 min. E. and is about 6 leagues in circumference. It is a beautiful spot, with a surface covered with verdure, and composed of hills and plains. The soil, in some parts is light and sandy; but further up the country, we saw from the ship by the assistance of our glasses, a reddish cast on the rising grounds. There the islanders build their houses, for we could perceive several of them which were long and spacious. Its produce is nearly the same with that of Mangeea, the island we last quitted. If we may depend on Omiah's account of what he learned from his three countrymen, in the course of conversation, the manners of the people of Watecoo, their general habits of life, and their manner of treating strangers, greatly resemble those that prevail at Otaheite, and its neighbouring islands. There is also a great similarity between their religious ceremonies and opinions. From every circumstance, indeed, it may be considered as indubitable, that the inhabitants of Watecoo derive their descent from the same stock, which has so remarkably diffused itself over the immense extent of the Southern Ocean. Omiah assured us, that they dignified their island with the pompous appellation of Wenooa no te Eatooa, implying a land of Gods, esteeming themselves a race of divinities, possessed with the spirit of the Eatooa. Their language was well understood by Omiah, and equally so by our two New Zealanders who were on board. Though the landing of our gentlemen was the means of enriching the history of our voyage with the foregoing particulars, yet the principal object in view was partly unattained; for we procured scarcely anything worth mentioning from the island. Indeed it appears from the circumstances already mentioned, that Watecoo can be of little use to any ship wanting refreshment, unless in the case of the most absolute necessity. The natives, knowing now the value of some of our commodities, might be induced to bring off fruits and hogs to a ship standing off or on, or to boats lying off the reef, as ours did. It is doubtful, however, if any fresh water could be procured. For, though some was brought in cocoa-nut shells to the gentlemen, they were told, that it was at a considerable distance; and, probably, it is only to be met with in some stagnant pool, as no running stream was any where to be seen.

Calms and light airs, having alternately prevailed during the night of the 3d of April, before day-break an easterly swell had carried the Resolution and Discovery some distance from Watecoo, but having failed of procuring

procuring, at that place, the supplies we wanted, we left it without regret, and steered for the island that had been discovered by us three days before. Having a gentle breeze at E. we got up with it by ten o'clock, A. M. on Friday, the 4th, when captain Cook immediately dispatched Mr. Gore with two boats, to see if he could land, and get subsistence for our cattle. Though a reef surrounded the land here, as at Watecoo, and a considerable surf broke against the rocks, our boats no sooner reached the west-side of the island, but they ventured in, and Mr. Gore and his party arrived safe on shore. Captain Cook seeing from the ship they had so far succeeded, sent off a small boat to know if farther assistance was required. She waited to take in a lading of the produce of the island, and, therefore, did not return till three o'clock in the afternoon. Being cleared, she was sent again for another cargo; at the same time the jolly boat was also dispatched upon the same business, with orders for Mr. Gore to return with the boats before night, which orders were punctually obeyed. The supply obtained here was about 200 cocoa-nuts for our companies, and for our cattle a quantity of grafs, with some leaves of the pandanus. This latter being of a soft, spongy nature, the cattle eat even the branches when cut into small pieces, which are very juicy. This island lies nearly four leagues from Watecoo, the inhabitants of which call it Otakootaia. It is in the latitude of 19 deg. 15 min. south, and the long. of 201 deg. 37 min. E. and is supposed not to exceed three miles in circuit. It is entirely destitute of water; and cocoa-palms were the only common trees found here, of which there were several clusters. We saw numbers of the wharra, as it is called at Otaheite, or the pandanus of the East Indies. We found likewise the calophyllum, suriana, with a few other shrubs: also a sort of bindweed, treacle-mustard, a species of the spurge, and the morinda citrifolia, the fruit of which last is sometimes eaten by the natives of Otaheite. Omiah, who landed with the party, dressed some of it for their dinner, but they thought the mess a very indifferent one. A beautiful cuckoo, of a chestnut brown, variegated with black, was the only bird seen among the trees; but, upon the shore, were a small sort of curlew, blue and white herons, some egg birds, and great numbers of noddies. One of the company caught a lizard running up a tree: though small, it had a most forbidding aspect. Many of another sort were also seen. Infinite numbers of a kind of moth, elegantly speckled with black, white, and red, frequented the bushes towards the sea. Some other sorts of moths, pretty butterflies, and a few insects of a different kind were observed. At this time no fixed inhabitants were seen upon this island; but we discovered a few empty huts, which convinced us of its being, at least, inhabited occasionally. Monuments, consisting of several large stones, were erected under the shade of some trees: we saw also some smaller ones, with which several places were inclosed, where we supposed their dead had been buried. In one place we found a great many cockle-shells, of a particular sort, finely grooved, and larger than the first; from which it was conjectured, that the island had been visited by persons who sometimes feed on shell-fish. Mr. Gore left a few nails and a hatchet in one of the huts, for the use of those who might hereafter touch at this island. It may, perhaps, surprize, and seem incredible to some of our readers, when they are told of so many islands abounding with inhabitants, who subsist with little or no water. Yet, true it is, that few or none of the little low islands between the tropics have any water on the surface of the ground, except perhaps in a lagoon, the water of which is generally brackish; nor is it easy to find water by digging. The fact is, the fruits of the earth are their chief food, and the milk of the cocoa-nut serves them for drink. They want no water to dress any part of their food, for they knew not the art of boiling till the Europeans taught them, nor had they a vessel fit for the purpose; neither have they any occasion for washing their cloaths, the materials of which they are made, being of the paper kind,

will not bear washing. Salt water therefore answers their purpose with very little fresh, and adds a relish to their fish; in which they dip almost every mouthful they eat. This in a great measure accounts for their subsisting without water.

Having hoisted in the boats, we made sail again to the northward, resolving to try our fortune at Hervey's Island, discovered during captain Cook's former voyage, in 1773, and named from Mr. Harvey, the first mate of the Endeavour. Sunday, the 6th, at day break, we came in sight of it, at the distance of about three leagues. About eight o'clock we observed several canoes coming from the shore towards the ships. We were rather surprized at this circumstance, as no traces or signs of inhabitants were seen when the island was first discovered: this, indeed, might be owing to a brisk wind that then blew, and prevented their canoes from venturing out. As we advanced nearer to the island, six or seven double canoes immediately came near us with from six to three men in each of them. At the distance of about a stone's-throw from the ship they stopped, and it was with difficulty Omiah prevailed on them to come along-side; but they could not be induced to trust themselves on board. Indeed, their disorderly behaviour did not indicate a disposition to trust, or to treat us well. They attempted to steal some oars out of the Discovery's boat, and struck a man for endeavouring to prevent them. They also cut away a net containing meat, which hung over the stern of that ship, and at first would not restore it, though they afterwards permitted us to purchase it from them. Those who were about our ship, the Resolution, behaved equally disorderly and daring; for with a sort of hooks, made of a long stick, they openly endeavoured to rob us of several things, and actually got a flock belonging to one of our people. It appeared that they had a knowledge of bartering, for they exchanged some fish for small nails, of which they were extravagantly fond, and called them goore. Pieces of paper, or any other trifling article that was thrown to them, they caught with the greatest avidity; and if what was thrown fell into the sea, they immediately plunged in to swim after it.

Though the distance between Harvey's Island and Watecoo is not very great, the inhabitants differ from each other, both in person and disposition. The colour of the natives of Harvey's Island is of a deeper cast, and some of them have a fierce savage aspect, like the natives of New Zealand. Their hair is long and black, either hanging loose about their shoulders, or tied in a bunch on the top of the head. Some few, indeed, had it cropped short, and in two or three of them, it was of a red or brownish cast. Their clothing is a narrow piece of mat, bound several times round the lower part of the body, and passing between the thighs. We saw a fine cap of red feathers in one of the canoes, and some of the natives were ornamented with the shell of a pearl-oyster, polished, and hung about the neck. The mode of ornament, so prevalent among the natives of this ocean, of puncturing, or tattooing their bodies, not one of them had adopted; but, though singular in this respect, their being of the same common race is not to be doubted. Their language more resembles the dialect of Otaheite, than that of Mangea or Watecoo. Like the natives of those islands, they enquired from whence we came, whither bound, the ship's name, that of our Captain, and the number of men on board. Such questions as we proposed to them, in our turn, they very readily answered. They informed us, among other particulars, that they had before seen two large ships, but had not spoken to them as they passed. These were, doubtless, the Resolution and Adventure. They acquainted us, that the name of their island was Terouggemou Atooa; and that they were subject to Teerevatoeah, king of Watecoo. Their food, they said, consisted of cocoa-nuts, fish, and turtle; being destitute of dogs and hogs, and the island not producing bread-fruit or plantains. Their canoes (near thirty of which appeared one time in sight) are tolerably large,

large, and well built, and bear some resemblance to those of Watceoo. About one o'clock, we drew near the N. W. part of the island; this being the only place where we could expect to find a good anchorage. Captain Cook immediately dispatched lieutenant King, with two armed boats, to sound, and reconnoitre the coast. The boats were no sooner hoisted out, than our new visitors suspended their traffic, pushing for shore as fast as possible, and came no more near us. The boats returned at three o'clock, and Mr. King informed the Captain, that he could find no anchorage for the ships; and that the boats could advance no farther than the outer edge of the reef, which was almost a quarter of a mile from the shore. That a number of the natives came upon the reef armed with clubs and long pikes, meaning, as he supposed, to oppose his landing; though, at the same time, they threw coconuts to our people, and requested them to land: yet, notwithstanding this seemingly friendly treatment, the women were very active in bringing down a fresh supply of darts and spears. This report having been taken into consideration, it was concluded, that, as we could not bring the ships to an anchor, an attempt to procure grafts here would be attended with delay and danger. Being thus disappointed in all the islands after our leaving New Zealand, and having from variety of circumstances, been unavoidably retarded in our progress, it was in vain to think of doing any thing this year in the high latitudes of the northern hemisphere, from which we were so far distant, though it was now the season for our operations there. Thus situated, it was necessary to pursue such measures as appeared best calculated to preserve our cattle, and save the stores and provisions of the ships; the better to enable us to prosecute our northern discoveries, which could not commence till a year later than was intended. If we could fortunately have procured a supply of water and grafts, at any of the islands we had lately visited, we intended to have stood back to the S. till we had got a westerly wind. But without such a supply, the certain consequence of doing this, would have been the loss of the cattle, before it was possible for us to reach Otaheite, without gaining a single point of advantage respecting the grand object of our voyage. The Captain, therefore, determined to bear away for the Friendly Isles, where he knew he could be well supplied with every thing he wanted: and it being necessary to run night and day, he ordered Captain Clerke to keep with the *Discovery* right a-head of us, because that ship could best claw off the land, which we might possibly fall in with in our passage.

Bearing away, therefore, we steered W. by S. with a fine breeze. It was proposed to proceed first to Middleburgh, or Eooa, thinking we might have provision enough for the cattle, to last till we should arrive at that island. But the next day, about noon, those faint breezes that had so long retarded us, again returned; and we found it necessary to get into the latitude of Palmerston's and Savage Islands, which captain Cook discovered in 1774; that, in case of necessity, recourse might be had to them. The weather continued variable, and though plenty of rain fell every day, yet it was found advisable to obtain water by distillation, to be used for every purpose for which it was fit. The still was kept at work a whole day; during which time we procured about 15 gallons of fresh water. It was apt to discolour the meat in which it was boiled, and to tincture every thing with a disagreeable blackness; but our crews preferred it to rain-water, on account of the tarry taste communicated by the latter. Light breezes continued till Thursday, the 10th, at which time the wind blew some hours fresh from the N. and N. W. In the afternoon we had some heavy rain, attended with thunder squalls. We collected as much rain-water as filled five of our puncheons. When these squalls had blown over, the wind was very unsettled, till the next day at noon, when it was fixed at N. N. W. and blew a fresh breeze. Sunday, the 13th, at day-break, we came in sight of Palmerston's Island, bearing W. by S. at the distance of about 5 leagues; but did not get up with it

No. 54.

till the 14th, at eight o'clock A. M. We now dispatched three boats, and one from the *Discovery*, with a proper officer in each, to search for a convenient landing place; we being, at this time, under an absolute necessity of procuring here some provender for our cattle, or we must certainly have lost them. What is called here Palmerston's Island, consists of a group of small islets, about nine or ten in number, connected together by a reef of coral rocks, and lying in a circular direction. The boats first examined the most south-easterly islet; and not succeeding there, ran down to the second, where they immediately landed. We now bore down with the ships, till we were abreast of the place, where we kept standing off and on, there being no bottom to be found to anchor upon. This, however, was of no material consequence, as there were no human beings upon this island, except the party who had landed from our boats. One of these returned at one o'clock, laden with scurvy-grafs, and young cocoa-trees, which was, at this time, a most excellent repast for our animals on board. A message was brought from Mr. Gore, who commanded the party on this expedition, informing us, that the island abounded with the produce of which he had sent us a sample, and also with the wharra-tree and cocoa-nuts; in consequence of which the Captain resolved to procure a sufficient supply of these useful articles, before we quitted our station, and accordingly he went ashore in a small boat, accompanied by the Captain of the *Discovery*; where they found, to their satisfaction, every one hard at work.

The landing place of this islet is a small creek, formed by the reef, of rather more than a boat's length in every direction, and covered from the force of the sea, by rocks projecting on each side. The islet itself is scarcely a mile in circuit; and not above three feet higher than the level of the sea. It appears to consist of a coral sand, with a small mixture of blackish mould, produced from rotten vegetables: yet, this poor soil is covered with trees and bushes of the same kind as those we had seen at Otakootaia or Wenooa-erte, though not in so great a variety. We perceived a great number of man-of-war-birds, tropic-birds, and two sorts of boobies, which were now laying their eggs, and so exceedingly tame as to permit us to take them off their nests, which consist only of a few sticks loosely put together. These tropic birds differ essentially from the common sort, being of a beautiful white, slightly tinged with red, and having two long tail-feathers of a deepish crimson. Our people killed a considerable number of each sort, which though not the most delicate kind of food, were highly acceptable to us, who had been a long time confined to a salt diet. We saw plenty of red crabs creeping about among the trees; and caught several fish, which, when the sea retired, had been left in holes upon the reef. At one part of this, which bounds the lake within, almost even with the surface, there is a large bed of coral, which affords a most enchanting prospect. Its base, which is fixed to the shore, extends so far that it cannot be seen, so that it appears to be suspended in the water. The sea was then unruffled, and the refulgence of the sun exposed the various sorts of coral, in the most beautiful order; some parts luxuriantly branching into the water; others appearing in vast variety of figures; and the whole heightened by spangles of the richest colours, glowing from a number of large clams, interspersed in every part. Even this delightful scene was greatly improved by the multitude of fishes, that gently glided along, seemingly with the most perfect security. Their colours were the most beautiful that can be imagined, blue, yellow, black, red, &c. far exceeding any thing that can be produced by art. The richness of this submarine grotto was increased greatly by their various forms; and the whole could not possibly be surveyed without a pleasing transport, accompanied, at the same time, with regret, that a work so astonishingly elegant should be concealed in a place so seldom explored by the human eye. No traces of any inhabitants having been here, were discovered. We saw, indeed, a piece of a canoe, upon the beach, but this

this might have been drifted from some other island. We were surpris'd, however, at perceiving some small brown rats on this little spot, not easily accounted for, unless we admit the possibility of their being imported in the canoe of which we saw the remains. The boats, when laden, returned on board, with the two captains, leaving Mr. Gore and his party to pass the night on shore, to be ready for business the next morning.

Tuesday, the 15th, like the preceding day, was spent in collecting subsistence for the cattle, consisting principally of tender branches of the wharra-tree, palm-cabbage, and young cocoa-nut trees. A sufficient supply of these having been procured by sun-fet, the Captain ordered all the people on board: but, having very little wind, he determined to employ the next day, by endeavouring from the islot to the leeward, to get some cocoa-nuts for our people: to this end we kept standing off and on all night; and about nine o'clock in the morning, we went to the west side of the islot, and landed from our boats, with little difficulty. The people immediately were employed in gathering cocoa-nuts, which we found in the greatest plenty; but it was a tedious operation to convey them to our boats, being obliged to carry them half a mile over the reef, up to the middle in water. Omiah, who accompanied us, presently caught with a scoop-net, as many fish as supplied the party on shore with a dinner, besides sending a quantity to each ship. Men-of-war and tropic birds were found in abundance, so that we fared most sumptuously. In these trips to the uninhabited islands, Omiah was of the greatest service to us. He caught the fish, and dressed them, as well as the birds we killed, after the fashion of his country, with a dexterity and cheerfulness that did him honour. Before night, the boats made two trips, and were each time heavily laden: with the last, the Captain returned on board, leaving our third lieutenant, Mr. Williamson, to prepare another lading for the boats against the next morning. Accordingly about seven o'clock they were dispatched, and returned at noon. No delay was made in sending them back for another cargo, with orders for all hands to be on board by sun-fet. These orders being punctually obeyed, we hoisted in our boats, and sailed to the westward, with a light breeze from the north. This last islot, which we now left, is somewhat larger than the other, and almost covered with cocoa-palms. The other productions were the same as at the first islot. On the beach we found two pieces of board, one of which was rudely carved, and an elliptical paddle. These were, perhaps, a part of the same canoe, the remains of which we had seen on the other beach, the two islots being within half a mile of each other. There were not so many crabs here as at the last place, but we found some scorpions and insects, and a much greater number of fish upon the reefs. Among the rest were some beautiful large spotted eels, which would raise themselves out of the water, and endeavour to bite their pursuers. There are also snappers, parrot-fish, and a brown spotted rock-fish, not larger than a small haddock, so tame, that it would remain fixed, and gaze at us. If we had been really in want, a sufficient supply might easily have been had, for thousands of the clams stuck upon the reef, many of which weighed two or three pounds. There were also some other sorts of shell-fish; and when the tide flowed several sharks came with it, some of which were killed by our people; but their presence rendered it, at that time, unsafe to walk in the water. Mr. Williamson and his party, who were left on shore, were much pestered in the night with musquitoes. Some of them shot two curlews, and some plovers on the shore: one or two cuckoos, like those at Wenooa-ette, were also seen. These islots, comprehended under the name of Palmerston's Island, may be said to be the summits of a reef of coral rock, covered only with a thin coat of sand; though clothed with trees and plants, like the low grounds of the high islands in this spacious ocean. They are situated in 18 deg. 11 min. S. lat. and 196 deg. E. long. from Greenwich.

We now steered W. in order to make Annamooka,

or, as it is called by the Dutch, Rotterdam, who first discovered it. We had variable winds with squalls, some thunder, and much rain. The showers being very copious, we saved a considerable quantity of water; and as we could procure a greater supply in one hour, by the rain, than by distillation in a month, we laid the still aside, as being attended with more trouble than advantage. The heat, which had continued in the extreme for about a month, became much more disagreeable in this close rainy weather, and we apprehended it would soon become noxious. It is remarkable, that there was not then a single person sick on board either of the ships. On Tuesday the 22nd, we had clear weather, but a great swell from the S. a sure preface of an approaching storm; which soon came on, and increased to such an alarming height before night, attended with thunder, lightning, and rain, with a tremendous sea, that brought the *Discovery* under bare poles till morning appeared. She then made sail under close reefed top-sails; and, about eleven at night, narrowly escaped running on shore on Savage Island. The man at the mast-head calling out land, they soon, dark as it was, got sight of it close on their lee-bow, steering directly for it. They instantly put about, and fired a gun as a signal for the *Resolution* (then to windward about half a mile) to do the same. So narrow an escape made a strong impression on the ship's company, who, thoughtless as seamen are, could not help looking up to heaven with thankful hearts for so signal a deliverance! As soon as it was light the next morning, we saw this execrated island at the distance of about four leagues. Savage Island was discovered by Captain Cook in 1774. In the night between the 24th and 25th we passed it; and on Monday, the 28th, about ten o'clock A. M. we saw the islands to the eastward of Annamooka, bearing N. by W. about five leagues distant. We steered to the S. and then hauled up for Annamooka. At the approach of night, the weather being squally, with rain, we anchored in fifteen fathoms water. Immediately two canoes paddled towards us, and came along side without hesitation. Four men were in one of the canoes, and three in the other. They brought with them some sugar-canes, bread-fruit, plantains, and cocoa-nuts, which they bartered with us for nails. After these canoes had left us, we were visited by another, but night approaching, she did not continue long with us. The nearest island to us was Komango, five miles distant to which, at four o'clock, the next morning, lieutenant King was dispatched with two boats, in order to procure refreshments. At five, signal was made to weigh, to proceed to Annamooka. When day-light appeared, we were visited by six or seven canoes, bringing with them two pigs, some fowls, several large wood-pigeons, small rails, and some violet coloured coots, besides fruits, and roots of various kinds, which they exchanged with us for nails, hatchets, beads, &c. They had other articles of commerce, but captain Cook gave particular orders that no curiosities should be purchased, till the ships were supplied with provisions, and they should have permission from him. About noon Mr. King's boat returned with seven hogs, some fowls, a quantity of fruit and roots: also some grass for our animals. His party was treated with great civility at Komango. The inhabitants did not appear to be numerous; and their huts, which almost touched each other, were but indifferent. Tooboulangee, the chief of the island, and another, named Taipa, came on board with Mr. King. They brought a hog, as a present to our Captain, and promised to bring a greater number the next day. The boats being aboard, we stood for Annamooka-ette, (or little Annamooka) and the breakers at the S. E. but on drawing near, we met with very irregular soundings, which obliged us to relinquish the design, and go to the southward. This carried us to leeward, and we found it necessary to spend the night under sail. It was dark and rainy, and we had the wind from every direction. The next morning, Wednesday, the 30th, at day-light, we were farther off than we had been the preceding evening, and the wind was now right in our teeth.

We continued to ply the whole day, to very little purpose; and, in the evening, anchored in 39 fathoms water; the west-point of Annamooka bearing E. N. E. four miles distant. Tooboulangee and Taipa, agreeable to their promise, brought off some hogs; and we obtained others, by bartering, from the different canoes that followed us, and a large quantity of fruit. It is remarkable, that those who visited the ships that day, would hardly part with any of their commodities to any one but Captain Cook.

On Thursday May the 1st, a boat was hoisted out, and the master was ordered to sound the S. W. side of Annamooka. When he returned, he reported, that he had founded between Great and Little Annamooka, where he found 12 fathoms depth of water: that the place was very well sheltered from winds; but that fresh water was to be had only at a considerable distance inland; and that even there it was neither plentiful nor good. For this good reason, it was resolved to anchor on the north-side of the island, where, in the captain's former voyage, he had found a convenient place for watering and landing. Though not above a league distant, we did not reach it till about five o'clock in the afternoon, being retarded by the quantity of canoes that crowded round the ships, laden with abundant supplies of the produce of their island. Several of these canoes, which were double, had a large sail, and carried between 40 and 50 men each. Several women were also in them, incited, perhaps, by curiosity to visit us; though they were as eager as the men in bartering, and used the paddle with equal skill and dexterity. We worked into the road, and cast anchor in 18 fathoms, the island extending from E. to S. W. three quarters of a mile distant. Thus Captain Cook resumed the station which he had occupied when he visited Annamooka three years before; and probably where Tasman, who first discovered this island, anchored in 1643.

We had now been just 60 days in a passage, which in a direct course could not have exceeded ten, and had been exposed to severe trials, owing to some fatality in pursuing a track which there was not a seaman aboard who did not disapprove. It seemed to have no object of discovery in view, as we fell nearly into the same which Captain Cook had formerly navigated; nor did we meet with a single island, which one or other of our late voyagers had not seen or visited in their different routs. How it happened is not easy to be accounted for, as it was next to a miracle, that any creature on board the *Resolution* remained alive to reach our present harbour. Had not the copious rains that fell almost incessantly from the time that we passed the tropic till our arrival here, supplied us with a daily consumption of water, not only the animals, but the men must have perished. Happy were we now, however, in finding ourselves on a friendly coast. We forgot the dangers we had escaped, and thought only of enjoying with inexpressible pleasure the sweets of these happy islands, whose spontaneous productions perfume the air to a considerable distance with a fragrance inconceivably reviving; and whose plantations exhibit a richness of prospect as we approach them, owing to the beautiful intermixture of the various blossoms, with the vivid green leaves of the trees, of which the most animated description can afford but a faint idea. Add to these, the tufted clumps which adorn the little rising hills, that appear every where interspersed delightfully among the verdant lawns, and rich, low, surrounding vallies. Nothing in nature can be more pleasing to the eye, or more grateful to the sense. We were no sooner moored in the harbour, than we were surrounded with innumerable little boats, or canoes, most curiously constructed and ornamented; the sides with a polish that surpassed the blackest ebony, and the decks inlaid with mother of pearl and tortoise-shell, equal to the best cabinets of European manufacture. In this kind of workmanship, those islanders seem to excel. Their weapons of war, their clubs, the paddles of their boats, and even their fish-hooks are polished and inlaid with variegated shells, by an

infinite accumulation of which their shores are margined, and among them our naturalists found some of superlative beauty. These boats generally held three persons, and under their decks, which take up two thirds of their length, they brought the fruits of their plantations, and the manufactures of their country, which consisted of a great variety of useful things, and others ornamental. Of the first sort, besides cloth of different fabrics, were combs, fish-hooks, lines, nets, needles made of bone, thread, purses, calabashes made of reeds, so closely wrought as to be water-tight; with a variety of other utensils. Among the latter, were bracelets, breast-plates, ornamented with feathers of a vivid glow; masks, mantalets composed of feathers, so artfully and beautifully arranged, as even our English ladies would not disdain to wear.

Friday the 2nd, during the preparations for watering, Captain Cook went on shore, in the forenoon, accompanied by Captain Clerke, and others, to fix on a place for setting up the observatories, the natives having readily granted us permission. Nor was the civility of the chiefs confined to their readiness in supplying the ships with provisions; for they complimented the Captain with the use of a large boat-house, conveniently situated near the beach, and which answered the purpose of a tent: and at the same time presented the officers with breast-plates, beautifully decorated with feathers, being the richest offerings they had to make. In return, our commander was not wanting in generosity, loading them with hatchets, knives, linen-cloth, glass and beads, with which they thought themselves amply repaid. Toobou, the chief of the island, conducted Captain Cook and Omiah to his house, situated on a pleasant spot in the centre of his plantation. It was surrounded with a grass-plot, which he said was for the purpose of cleaning their feet before they entered his habitation. Such an attention to cleanliness we had never observed before, wherever we had visited in this ocean; though we afterwards found it to be very common at the Friendly Islands. No carpet in an English drawing-room could be kept neater, than the mats that covered the floor of Toobou's house. Tents were now carried on shore, the astronomers observatory erected; wooders and waterers appointed; and all the artificers on board employed in the reparations of the ships; not a few being wanting after a voyage of two months, through a tempestuous sea, during which the elements of fire, air, and water, might be said to be in perpetual conflict. While these things were about, we bartered for some hogs and fruit; the ships were crowded with the natives; and as very few of them came empty-handed, we were speedily supplied with every refreshment. During these transactions the two captains, and the chiefs of Annamooka, were contriving to vary the pleasures of their respective guests, and to entertain them with new diversions. They were mutually engaged on board and on shore to surprise each other with novelty. On board, the chiefs were entertained with music, dancing, and feasting, after the European manner; and with what seemed more pleasing to them, as they paid more attention thereto, with the various operations of the artificers who were at work on their respective employments. The facility with which the boat-builders performed their work attracted particularly their notice: when they beheld the labour of a year with them performed in a week, by a less number of hands, their astonishment was beyond conception; nor were they less amazed to see large timber cut through the middle, and sawed into plank, while they were spectators, which they had no means of effecting in their island in many days. The chiefs on shore, in return, endeavoured to entertain our gentlemen: they feasted them, like tropical kings, with barbecued hogs, fowls, and with the most delicious fruits. After dinner, they introduced their music, and dancers, who were chiefly of the theatrical kind, and excelled in agility, and varied attitudes, many of the capital performers in Europe. A sort of pantomime succeeded, in which some prize-fighters displayed their feats of arms; and this part of the drama concluded with a humorous representation

presentation of some laughable story, which produced among the chiefs, and their attendants, the most immoderate mirth. The songsters came last, the melody of whose voices was heightened by a kind of accompaniment, not unusual in the earliest ages, among the politest nations, as may be learnt from ancient paintings, where the singers and dancers are represented with flat clams or shells in their hands, snapping them together, to harmonize their tunes, and regulate their movements. Though this farcical exhibition was insipid to us, it was not wholly without its use, in marking a similarity of manners among mankind, at the distance of half the globe, and at a period when the arts of civil life were in their infancy. Who knows, but that the seeds of the liberal arts, that have now been sown by European navigators in these happy climes, may, a thousand years hence, be ripened into maturity; and that the people, who are just emerging from ignorance into science, may, when the memory of these voyages are forgotten, be found in the zenith of their improvements by other adventurers, who may pride themselves as the first discoverers of new countries, and an unknown people, infinitely superior to those, who at that time, may inhabit these regions, and who may have lost their boasted arts, as we, at this day see, among the wretched inhabitants of Greece, and the still more miserable slaves of Egyptian bondage. Such are the vicissitudes to which the inhabitants of this little orb are subject; and such, perhaps, are the vicissitudes which the globe itself must undergo before its final dissolution. To a contemplative mind, these islands present a mortifying spectacle of the ruins of a broken and desolated portion of the earth; for it is impossible to survey so many fragments of rocks, some with inhabitants and some without, and not conclude with the learned Dr. Burnet, that they are the effects of some early convulsion of the earth, of which no memory remains.

Captain Cook having settled every thing to his satisfaction, returned on board in the evening, leaving Mr. King in command upon the island. Taipa was now become our trusty friend, and, in order to be near our party, had a house carried on mens shoulders, a quarter of a mile, and placed by the side of the shed which our party occupied.

On Saturday the 3d, our various operations on shore began. Some were busied in making hay, others in filling our water-casks, and a third party in cutting wood. On this day Mess. King and Baily began to observe equal latitudes of the sun, in order to get the rate of our time-keepers. In the evening, Taipa harangued the natives for some time, but we could only guess at the subject, and supposed he was instructing them how to treat us, and advising them to bring the produce of the island to market. His eloquence had the desired effect, and occasioned us to receive a plentiful supply of provisions the day following. On the 4th, the Discovery lost her small bower anchor, the cable being cut in two by the rocks. On the 6th, we were visited by a chief from Tongataboo, whose name was Feenou: he was introduced by Taipa in the character and stile of king of all the Friendly Isles. Captain Cook was now informed, that, on our arrival, a canoe had been immediately dispatched to Tongataboo with the news, which occasioned his coming to Annamooka. We were also informed by the officer on shore, that, on his arrival, all the natives were ordered out to meet him, who saluted him by bowing their heads as low as his feet, the soles of which they touched with the palm of each hand, and afterwards with the back part. A personage received with such extraordinary marks of respect, could not be supposed less than a king. In the afternoon, our captain went to pay a visit to this great man, having first received from him a present of two fish, brought on board by one of his attendants. As soon as the captain landed, Feenou came up to him. He was tall and thin, and appeared to be about thirty years of age. His features were more of the European cast than any we had seen here. After the first salutation, Captain Cook requested to know if he was king; as he

entertained some doubts on that score, perceiving he was not the man whom he remembered to have seen in that character during his former voyage. Taipa answered eagerly for him, and mentioned no less than 153 islands, of which, he said, he was the sovereign. Soon after, our grand visitor, attended by five or six servants, accompanied us on board. Captain Cook made them suitable presents, and entertained them in a manner which he thought would be most agreeable to them. Towards the evening the captain attended them on shore in his boat, into which, by order of the chief, three hogs were conveyed, as a return for the presents he had received. We were then informed of an accident, the relation of which will convey some idea of the extent of the authority exercised here over the inferior sort of people. While Feenou was on board the Resolution, an inferior chief ordered all the natives to retire from the post they occupied. Some of them, however, having ventured to return, he beat them most unmercifully with a large stick. One, in particular, received so violent a blow on the side of the face, that the blood gushed from his mouth and nostrils; and, after lying motionless for some time, he was removed from the place in convulsions. The savage who gave the blow, on being told, that he had certainly killed the man, only laughed at the circumstance, and, indeed, it was very evident he did not grieve for what he had done. We had afterwards the satisfaction of hearing, that the poor sufferer was out of danger. On the 7th, being Wednesday, the Discovery having found her small bower anchor, shifted her birth; but not till after her best bower cable had met with the fate of the other. This day Feenou dined on board the Resolution; and also on the next, when he was attended by Taipa, Toobou, and some other chiefs. Taipa only, however, was permitted to sit at table with Feenou, or even to eat in his presence. The captain was highly pleased on account of this etiquette; for before the arrival of Feenou, he had generally a larger company than he chose, his table being crowded with visitors of both sexes. For though at Otaheite the females are denied the privilege of eating in company with the men, this is not the practice at the Friendly Islands.

A large junk axe having been stolen out of the ship by one of the natives, on the first day of our arrival at Annamooka, application was made to Feenou to exert his authority to get it restored; who gave orders for that purpose; which exacted such implicit obedience, that it was brought on board before we had finished our dinner. We had many opportunities of remarking how expert these people were in thievery. Even some of their chiefs were not ashamed of practicing that art. On the 9th, one of them was detected carrying out of the ship the bolt belonging to the spun-yarn winch, which he had carefully concealed under his cloaths; for which offence the captain sentenced him to receive a dozen lashes, and to be confined till he paid a hog for his liberty. Though, after this circumstance we were troubled with no more thieves of rank, their servants and slaves were constantly employed in this dirty business; and they received a flogging with as much seeming indifference, as if it had been upon the main-mast. When any of them were caught in the act of thieving, instead of interceding in their behalf, their masters would advise us to kill them: but as we were not disposed to be their judges and executioners, they generally escaped without any kind of punishment: for we thought them to be alike insensible of the shame and torture of corporal chastisement. At length Captain Clerke contrived a mode of punishment which had some effect. Immediately upon detection, he ordered their heads to be completely shaved, and thus pointed them out as objects of ridicule to their countrymen; at the same time our people were put upon their guard, to deprive them of future opportunities for a repetition of their thefts. Feenou was so fond of our company, that he dined on board every day; but he did not always partake of our fare. Saturday the 10th, his servants brought him a mess, which had been dressed

on shore, consisting of fish, foup, and yams: cocoa-nut liquor had been used instead of water, in which the fish had been boiled or stewed, (perhaps in a wooden vessel with hot stones) and it was brought on board in a plantain leaf. Captain Cook tasted of the mess, and was so well pleased with it, that he afterwards ordered some fish to be dressed in the same way; but though his cook succeeded tolerably well, it was much inferior to the dish he attempted to imitate.

Sunday the 11th, we removed from the shore, the observatories, horses, and a variety of things we had landed, intending to sail as soon as the Discovery should have recovered her best bower anchor. The live stock which had been landed the day after our arrival, on a small island, about half a mile from the shore to graze, were amazingly recovered: from perfect skeletons, the horses and cows were grown plump, and as playful as colts. On the 12th, the tents were struck, and Mr. Philipson, lieutenant of marines, lost all his bedding, by the carelessness of the sentinel, who received 12 lashes for neglect of duty. In the morning, the long-boat was found swamped; and all the stern sheets, and several other articles belonging to her missing, and never recovered, for which the marine, who had the care of the watch, was severely punished. Feenou, hearing that the captain meant to proceed to Tongataboo, earnestly entreated him to alter his plan; expressing as much aversion to it, as if, by diverting him from it, he wished to promote some particular interest of his own. He warmly recommended a group of islands called Hapae, lying to the N. E. where he assured us, we could be easily and plentifully supplied with every refreshment; and even offered to attend us thither in person. In consequence of his advice Hapae was made choice of; and as it had not been visited by any European vessel, the surveying it became an object to Captain Cook. On Tuesday the 13th, Captain Clerke's anchor was happily recovered; and on the morning of the 14th, we made sail, and left Annamooka, with a fine breeze, wind N. E. course W. S. W.

Notwithstanding this island is somewhat higher than the other small isles that surround it, yet it is lower than Manglea and Wateoo; and even those are but of a moderate height. The shore where our ships lay, consists of a steep, rugged, coral rock, about nine or ten feet high, except two sandy beaches, which are defended from the sea, by a reef of the same sort of rock. In the centre of the island is a salt water lake, about a mile and a half in length, round which the ground rises with a gradual ascent, and we could not trace its having any communication with the sea. On the rising parts of the island, especially towards the sea, the soil is either of a blackish loose mould, or a reddish clay; but there is not a stream of fresh water to be found in any part of the island. The land is well cultivated, except in a few places; and, though some parts appear to lie waste, they are only left to recover the strength exhausted by constant culture; for we often saw the natives at work upon these fallows, in order to plant them again. Yams and plantains form their principal plantations; many of which are very extensive, and enclosed with fences of reeds about six feet high. Fences of less compass were often seen within these, surrounding the houses of the principal people. The bread-fruit and cocoa-nut-trees are interspersed without any regular order, but principally near the habitations of the natives. The other parts of the island, especially towards the sea and round the lake, are covered with luxuriant trees and bushes; among which are a great many mangroves and faitanoo-trees. All the rocks and stones about the island are of coral, except in one place, to the right of the sandy beach, where there is a rock of about 25 feet in height, of a calcareous stone, and of a yellowish colour; but even here, some large pieces are to be seen of the same coral rock as that which composes the shore. We sometimes amused ourselves by walking up the country and shooting wild ducks, resembling our widgeon, which are very numerous on the salt lake, as well as on the

No. 55.

pool where we procured our water. We found, in these excursions, that the inhabitants frequently deserted their houses to repair to the trading place, without entertaining the least suspicion, that strangers would take away, or destroy, any property that belonged to them. From this circumstance it might be supposed, that most of the natives were sometimes collected on the beach, and that there could be no great difficulty in forming an accurate computation of their number; but the continual resort of visitors from other islands, rendered it impossible. However as we never saw more than a thousand persons collected together at one time, it may reasonably be supposed, that there are twice that number upon the island. In the direct tract to Hapae, whither we were now bound, to the N. and N. E. of Annamooka, a great number of small isles are seen. We had more than 60 within sight, all of them surrounded with reefs of rocks, with so many windings and turnings, as truly might be said to constitute a labyrinth. Amidst the rocks and shoals adjoining to this group, we were doubtful whether there might be a free passage for ships of such magnitude as ours; though the natives sailed through the intervals in their canoes: therefore when we weighed anchor from Annamooka, we steered to go to the westward of the above islands, and N. N. W. towards Kao and Toofoa, two islands remarkable for their great height, and the most westerly of those in sight. Feenou, with his attendants remained in the Resolution till about noon of Wednesday the 14th, and then entered the large sailing canoe, which had brought him from Tongataboo, and stood in among the cluster of islands of which we were now abreast. They are scattered, at unequal distances, and most of them are as high as Annamooka. Some of them are two or three miles in length, and others only half a mile. Many of them have steep rocky shores; some reddish cliffs; and others have sandy beaches, extending almost their whole length. In general, they are entirely clothed with trees, among which are many cocoa-palms, each having the appearance of a beautiful garden placed in the sea. The serene weather we now had, contributed greatly to heighten the scene; and the whole might convey an idea of the realization of some fairy land. It appears, that some of these islands have been formed, as Palmerston's island was supposed to have been; for one of them is now entirely sand, and another has but a single bush or tree upon it. About four o'clock P. M. we steered to the north, leaving Toofoa and Kao on our larboard. We intended to have anchored for the night, but it came on before we could find a place in less than 50 fathoms water; and we rather chose to spend the night under sail, than come to in such a depth. At four o'clock in the afternoon, we had been within two leagues of Toofoa, and observed the smoke thereof several times in the day. There is a volcano upon it, of which the friendly islanders entertain some superstitious notions: and call it Kollofeca, saying it is an Orooa, or divinity. We were informed, that it sometimes throws up very large stones, and the Crater is compared to the size of a very small islet, which has not ceased smoking in the memory of the inhabitants; nor have they any tradition that it ever did. We sometimes saw the smoke from the centre of the island, even at Annamooka, the distance of at least 10 leagues. We were told, that Toofoa is but thinly inhabited, but that the water upon it is excellent. On Thursday the 15th, at day-break, we were not far from Kao, which is a large rock of a conic figure; we steered to the passage between Footooa and Hafaiva, with a gentle breeze, at S. E. About ten o'clock, Feenou came on board, and continued with us all day. He brought with him some fruit and two hogs; and in the course of the day, several canoes came to barter quantities of the former article, which were very acceptable to us, as our stock began to be low. At noon we observed in latitude 19 deg. 49 min. 45 sec. S. and we had made seven miles longitude from Annamooka; at the same time Toofoa bore N. 88 deg. W. Kao N. 71 deg. W. Footooa N. 89 deg. W. and Hafaiva S. 12 deg. W.

AFTER having passed Footooa, we met with a reef of rocks, and, being little wind, we found some difficulty in keeping clear of them. When we had passed this reef, we hauled up for Neeneeva, a small low isle in the direction of E. N. E. from Footooa, in hopes of finding an anchorage, but were again disappointed; for notwithstanding we had land in every direction, the sea was unfathomable. In the course of this night, we saw plainly the flames issuing from a burning mountain upon Toofoa. On Friday the 16th, at day-break, we held on our course for Hapace, which at this time was in sight; and we perceived it to be low land, from the trees only appearing above the water. At nine o'clock it appeared to form three islands, equal nearly in size; and soon after, a fourth appeared to the southward of these, as large as any of the others. Each of the islands appeared to be of a similar height and aspect, and about six or seven miles in length. The most northern of them is called Haanno, the next Foa, the third Lefooga, and the fourth Hoolaiva; but they are all four included under the general name of Hapace. By sun-set, we got up with the northernmost of these isles, where we experienced the same distress for want of anchorage, that we did the two preceding evenings, having another night to spend under sail, with land and breakers in every direction. Feenou, who had been on board all day, went forward to Hapace in the evening, and took Omiah with him in the canoe. He was not unmindful of our disagreeable situation, and kept up a good fire the whole night, by way of land-mark. Saturday, the 17th, at day-break, being then close in with Foa, we perceived it was joined to Haanno, by a reef running from one island to the other, even with the surface of the sea. A boat was now dispatched in search of anchorage; and a proper place was found, abreast of a reef which joins Lefooga to Foa, having 24 fathoms depth of water. In this station the northern point of Hapace bore N. 16 deg. E. The southern point of Hapace, or the south end of Hoolaiva, S. 29 deg. W. and the north end of Lefooga, S. 65 deg. E. Two ledges of rocks lay without us; the one bearing S. 50 deg. W. and the other W. by N. half N. distant two or three miles. We were not more than three quarters of a mile from the shore; and, as we lay before a creek in the reef, it was convenient landing at all times.

We had scarcely moored, before we were surrounded with natives from all quarters, who had been apprized of our coming, and who had loaded their canoes with hogs, fowls, bread-fruit, yams, plantains, and every kind of fruit the island produced, which they exchanged for broken glass, red and blue beads, hatchets, knives, nails, shreds of scarlet cloth, or indeed any thing we offered them. Here our friend Feenou assumed the same consequence as at Annamooka. He brought along-side his canoe laden with four large hogs, bread-fruit, and shaddock, a fine odoriferous fruit, in smell and taste not unlike a lemon, but larger and rounder. He brought likewise yams of an enormous size, weighing from 50 to 60 pounds each. Feenou and Omiah

having come on board in order to introduce our commander to the natives of the island, he soon accompanied them on shore for that purpose. The chief conducted the captain to a hut, situated close to the sea-beach, which was brought thither but a few minutes before for his reception. In this Feenou, Omiah, and Captain Cook, were seated. The other chiefs and the multitude appeared fronting them on the outside; and they also seated themselves. Captain Cook being asked how long he intended to stay, said five days. Taipa was, therefore, ordered to sit by him and declare this to the people. Hereupon he harangued them in words nearly to the following purport, as we were afterwards informed by Omiah. He exhorted both old and young, to look upon Captain Cook as a friend, who meant to continue with them a few days; and that, during his stay among them, they would not steal any thing from him, or offend him in any other manner. He informed them that it was expected they should bring hogs, fruit, &c. to the ships; for which they would receive such articles as he enumerated in exchange. Soon after Taipa had delivered his address to the assembly, Feenou left them; on which Captain Cook was informed by Taipa, that it was necessary he should make a present to Earoupa, the chief of the island. The captain being not unprepared for this, gave him such articles as far exceeded his expectation. This liberality created similar demands from two chiefs of other isles who were present, and even from Taipa himself. Soon after he had made the last of these presents, Feenou returned, and expressed his displeasure to Taipa, for suffering the captain to be so lavish of his favours. But this was doubtless a finesse, as he certainly acted in concert with the others. Feenou, having resumed his seat, ordered Earoupa to sit by him, and harangue the people as Taipa had done, which he did nearly to the same purpose. These ceremonies being over, the chief, at the captain's request, conducted him to three stagnant pools of what he called, fresh water; in one of which the water was indeed tolerable, and the situation convenient for filling the casks. When the chief returned to his former station, he found a baked hog and some yams smoking hot, ready to be conveyed on board for his dinner. He invited Feenou and his friends to partake of the repast, and they embarked for the ship, though none but himself sat down with us at table. Dinner being over, the captain conducted them ashore; and, before he returned, received as a present from the chief, a fine large turtle, and a quantity of yams. We had a plentiful supply of provisions, for, in the course of the day, we got, by bartering with the natives, about 20 small hogs, together with a large quantity of fruit and roots.

Sunday the 18th, early in the morning, Feenou and Omiah, who now, with the chief, slept on shore, came aboard to request Captain Cook's presence upon the island. He accompanied them, and upon landing, was conducted to the place where he had been seated the preceding day, and where he beheld a large concourse of people already assembled. Though we imagined something

London, Published by the Author, at the Kings Arms, N° 61, Whitechapel Road.

something extraordinary was in agitation, yet we could not conjecture what, nor could Omiah give us any information. Soon after we were seated, about an hundred of the natives appeared, and advanced, laden with yams, plantains, bread-fruit, cocoa-nuts, and sugar-canes; their burthens were deposited on our left. A number of others arrived soon after, bearing the same kind of articles, which were collected into two piles on our right-side. To these were fastened two pigs, and half a dozen fowls, and to those on the left, six pigs, and two turtles. Earoupa seated himself before the articles on our left, and another chief before those on our right; they being, as we supposed, the two chiefs who had procured them by order of Feenou, who was as implicitly obeyed here, as he had been at Annamooka, and who had probably laid this tax upon the chiefs of Hapae for the present occasion. When this munificent collection of provisions was placed in order, and advantageously disposed for public view, the bearers joined the multitude, who formed a circle round the whole. Immediately after, a number of men, armed with clubs, entered this circle or area; where they paraded about for a few minutes, and then one half of them retired to one side, and the other half to the other side, seating themselves before the spectators. Presently after, they successively entertained us with single combats: one champion on one side challenging those of the other side, partly by words, but more by expressive gestures, to send one of their party to oppose him. The challenge was in general accepted; the two combatants placed themselves in proper attitudes; and the engagement began, which continued till one of them yielded, or till their weapons were broken. At the conclusion of each combat, the victor squatted himself down before the chief, then immediately rose up and retired. Some old men, who seemed to preside as judges, gave their plaudit in a very few words; but the multitude, especially those on the side of the conqueror, celebrated the glory he had acquired in two or three loud huzzas. In these mock fights, which differed but little from our cudgel-players in England, the combatants beat one another pretty severely. This entertainment was sometimes suspended for a short space, and the intervals of time were filled up with wrestling and boxing matches. The first were performed in the method practiced at Otaheite, and the second differed very little from the English manner. A couple of stout wenchers next stepped forth, and, without ceremony, began boxing with as much dexterity as the men. This contest, however, was but of short duration, for, in the space of half a minute, one of them gave it up. The victorious heroine was applauded by the spectators, in the same manner as the successful combatants of the other sex. Though we expressed our disapprobation of this part of the entertainment, it did not prevent, however, two other females from entering the lists; who seemed to be spirited girls, and if two old women had not interposed to part them, would probably have given each other a good drubbing. When these sports were exhibited, three thousand spectators, at least, were present, and every thing was conducted with the most perfect good humour on all sides, though some of the champions, of both sexes, received blows which they must have felt the effect of for some time after.

The diversions being finished, the chief informed Captain Cook, that the provisions on our right-hand were a present to Omiah; and that those on our left, making about two thirds of the whole quantity, were intended for him, and that he might suit his own convenience in taking them aboard. Four boats were loaded with the munificence of Feenou, whose favours exceeded any that Captain Cook had ever received from the sovereigns of any of the islands we had visited in the Pacific Ocean. He, therefore, embraced the first opportunity of convincing Feenou, that we were not insensible of his liberality, by bestowing upon him such commodities as he supposed were most valuable in his estimation. Feenou was so highly pleased with the return that was made him, that he left the captain still indebted to him, by sending him two large hogs,

some yams, and a considerable quantity of cloth. In this manner, and in ranging the island, botanizing, examining the curiosities, natural and artificial, we employed our time, while the live stock were recruiting their flesh, and the several artificers were completing the repairs of the ship. It is not easy for people, who are totally unacquainted with the language of a country, to make themselves masters of the civil policy of the inhabitants. Indeed it is next to impossible in a short residence among them. As we observed no such medium as money, by which the value of property is ascertained, it was not easy to discover what else they had substituted in its room, to facilitate the modes of traffic among themselves. That each had a property in the plantation he possessed, we could plainly discern; and the chiefs were ready enough to point out their possessions, the extent of which gave them consequence, as among other civilized nations; but no such thing as circulating property being discoverable, by the hoarding up of which, and laying it out occasionally to advantage, one might purchase another's landed or substantial property, we could not inform ourselves sufficiently, by what means the fisherman purchased his canoe, or the boat-builder his materials, yet there cannot remain a doubt, but that the boat-builder had an interest in his boat after it was built, as well as the chief in his plantation, after it is inclosed and cultivated. With us all was carried on by barter, and an imaginary value fixed on every article. A hog was rated at a hatchet, and so many bread-fruit, cocoa-nuts, and plantains, at a string of beads; and so in like manner throughout; but among themselves, we saw no such value by way of barter. We did not observe so much fruit given for so many fish; nor so many combs, needles, or useful materials, for a certain proportion of cloth; yet, doubtless, some mode of exchange there must be among them; for it is certain there is no such thing as money, at least, none that we could discern: neither could we discover any distinct property, which one man claimed more than another in the forests or woods; but that every man, like us, cut what he wanted for use, and was under no limitation for fuel. Salt, which is so necessary an article in European house-keeping, is wholly unknown to these tropical islanders.

Feenou having expressed a desire to see the marines perform their exercise, Captain Cook ordered them ashore on Tuesday the 20th. They went through their military manœuvres, surrounded by thousands of the natives, who were frightened at the first firing, and fled like herds of deer from the report of the guns; but finding no harm ensue, they took courage, and rallied at a distance; but no persuasions could prevail upon them to come near. After they had gone through various evolutions, and fired several volleys, the chief in his turn, entertained us with an exhibition, performed with an exactness, and agility, far surpassing what they had seen in our military movements. It was a kind of dance, performed by men, in which 105 persons were engaged, each having an instrument in his hand, resembling a paddle, two feet and a half long, with a thin blade, and a small handle. With these instruments various flourishes were made, each of which was accompanied with a different movement, or a different attitude of body. At first, the dancers ranged themselves in three lines, and so changed their stations by different evolutions, that those who had been in the rear came into the front. At one part of the performance, they extended themselves in one line; afterwards they formed themselves into a semi circle, and then into two square columns. During the last movement, one of them came forward and performed an antic dance, with which the entertainment ended. The music that accompanied the dances was produced by two drums, or rather hollow logs of wood, from which they forced a few varied notes, by beating on them with two sticks. The dancers, however, did not appear to be much assisted or directed by these sounds, but by a chorus of vocal music, in which all the performers joined. Their song was rather melodious,

ous, and their corresponding motions were so skilfully executed, that the whole body of dancers appeared as one regular machine. Such a performance would have been applauded even on a European theatre. It far exceeded any attempt that we had made to entertain them; inasmuch that they seemed to plume themselves on their superiority over us. They liked none of our musical instruments, except the drum; and even they thought that inferior to their own: our French horns they held in the highest contempt, and would not pay the smallest attention to them, either here, or at any other of the islands. To give them a more favourable opinion of the amusements, and superior attainments of the English, Captain Cook ordered some fire-works to be prepared; and after it was dark, exhibited them in the presence of Feenou, and a vast multitude of people. They were highly entertained with the display in general; but our water and sky-rockets astonished them beyond all conception; and they now admitted that the scale was turned in our favour.

This exhibition, however, served only as an additional stimulus to urge them to proceed to fresh exertions of their singular dexterity; for as soon as our fire-works were ended, a succession of dances, which Feenou had prepared for our entertainment, began. A band of music, or chorus, consisting of 18 men, seated themselves before us, in the centre of a circle formed by the numerous spectators. About four or five of the performers had each pieces of large bamboo, from three to six feet in length, each played on by one man, who held it almost vertically: the upper end whereof was open, but the other closed by one of the joints. They kept constantly striking the ground, though slowly, with the close end, and thus produced a variation in the notes, according to the different lengths of the instruments, but all were of the base or hollow kind; which was counteracted by a person who struck nimbly a piece of the same substance, split, and lying upon the ground, furnishing a tone as acute, as the others were grave and solemn. The whole of the band (including those who performed upon the bamboos) sung a slow soft air, which so finely tempered the harsher notes of the instruments, that the most perfect judge of the modulation of sweet sounds, would confess the great power, and pleasing effect of this simple harmony. About a quarter of an hour after the concert began, 20 women entered the circle, whose hands were adorned with garlands of crimson flowers; and many of their persons were decorated with leaves of trees, curiously scolloped, or ornamented at the edges. They encircled those of the chorus, with their faces towards them, and began by singing a soft air, to which responses were made by the chorus; and those were alternately repeated. The women accompanied their song with many graceful motions of their hands, and continually advancing and retreating with one foot, while the other remained fixed. After this, they turned their faces to the assembly, and having sung some time, retreated slowly in a body, and placed themselves opposite to the hut, where the principal spectators sat. One of them next advanced from each side, passing each other in the front, and moving progressively till they came to the rest. On which two advanced from each side; two of whom returned, but the other two remained; and to these, from each side, came one by intervals, till they had, once more, formed a circle about the chorus. Dancing to a quicker measure now succeeded, in which the performers made a kind of half turn by leaping; then clapping their hands, and snapping their fingers, repeated some words in unison with the chorus. As they proceeded in the dance, the rapidity of their music increased; their gestures and attitudes were varied with wonderful dexterity; and some of their motions would, by an European, be thought rather indecent; though, perhaps, they meant only to display the astonishing variety of their movements. This female ballet was succeeded by one performed by 15 men; and though some of them were old, time seemed to have robbed them of but little of their agility. They were disposed in a sort of circle, divided at

the front. Sometimes they sung slowly, in concert with the chorus, making several graceful motions with their hands, but differing from those of the women; at the same time inclining the body alternately to either side, by raising one leg outward, and resting on the other; the arm of the same side being also stretched upward. They then recited sentences, which were answered by the chorus; and occasionally increased the measure of the dance, by clapping the hands and accelerating the motion of the feet. Towards the conclusion, the rapidity of the music and dancing so much increased, that the different movements were hard to be distinguished.

When this dance was finished, but after a considerable interval, twelve other men advanced, placing themselves in double rows, fronting each other. On one side was stationed a kind of prompter, who repeated several sentences, to which responses were made by the performers and the chorus. They sung and danced slowly; and gradually grew quicker, like those whom they had succeeded. Next to these nine women advanced and sat down opposite the hut where the chief had placed himself. A man immediately rose and gave the first of these women a blow on the back with both his fists joined: he treated the second and third in the same manner; but when he came to the fourth, he struck her on the breast: upon seeing this, a person instantly rising up from among the crowd, knocked him down with a blow on the head, and he was quietly carried away. But this did not excuse the other five women from so extraordinary a discipline; for they were treated in the same manner by a person who succeeded him. When these nine women danced, their performance was twice disapproved of, and they were obliged to repeat it again. There was no difference between this dance and that of the first set of women, except that these sometimes raised the body upon one leg, and then upon the other, alternately, by a sort of double motion. Soon after a person entered unexpectedly, making some ludicrous remarks on our fire-works that had been exhibited, which excited a burst of laughter from the crowd. We had then a dance by the attendants of Feenou: they formed a double row of 24 each round the chorus, and joined in a gentle soothing song, accompanied with motions of the heads and hands. They also began with slow movements, which gradually became more and more rapid, and closed finally with several very ingenious transpositions of the two circles. The festival of this memorable night concluded with a dance, in which the principal people assisted. In many respects it resembled the preceding ones, but they increased their motions to a prodigious quickness, shaking their heads from shoulder to shoulder, inasmuch that they appeared in danger of dislocating their necks. This was attended with a clapping of the hands, and a kind of savage shriek. A person on one side, repeated something in a truly musical recitative, and with an air so graceful, as might put some of our applauded performers to the blush. He was answered by another, and this was repeated several times by the whole body on each side; and they finished, by singing and dancing, as they had begun. The two last dances were approved universally by the spectators. They were perfectly in time, and some of their gestures were so expressive, that it might justly be said, they spoke the language that accompanied them. The theatre for these exhibitions and performances was an open space among the trees, bordering on the sea, with lights placed at small intervals, round the inside of the circle. Though the concourse of people was pretty large, their number was much inferior to that assembled in the forenoon, when the marines performed their exercise. At that time many of our gentlemen supposed there might be present 5000 persons or upwards; but the captain thought that account rather exaggerated.

On Wednesday the 21st, a chief went on board the *Discovery*, and presented her captain with a large, elegant head-dress, ornamented with pearls, shells, and red feathers, and wreathed with flowers of the most splendid

NIGHT DANCE, by WOMEN, in HAPAE.

REPRODUCTION OF THE PUBLISHED BY THE HAWAIIAN GOVERNMENT

splendent colours. In return, Captain Clerke loaded him with many useful articles of European manufacture, knives, scissars, saws, and some gaudy strings of beads, which were highly prized by the chief, who thought it no disgrace to paddle himself on shore, with his rich acquisitions. This day Captain Cook made an excursion into the island of Lefooga, which, in some respects, was found to be superior to Annamooka, the plantations being not only more numerous, but also more extensive. Various parts of the country near the sea are waste, owing perhaps to the sandiness of the soil: but in the internal parts of the island, the soil is better; and there the marks of population, and of an improved state of cultivation, are very conspicuous. Many of the plantations are enclosed in such a manner, that the fences, running parallel to each other, form spacious public roads. Large spots, covered with the paper-mulberry-trees, were observed; and the plantations, in general, were stocked abundantly with such plants and fruit-trees as the island produces. To these we made some addition, by sowing the seeds of melons, pumpkins, Indian-corn, &c. At one place was a house, four times as large as the ordinary ones, with an extensive area of grass before it, to which the people probably resort on some public occasions, particularly in the rainy seasons. Near the landing-place we observed a mount, two or three feet high, whereon stood four or five little huts, in which the bodies of some persons of distinction had been interred. The island is but seven miles in length, and its breadth, in some places, is not more than three miles. The east-side has a reef, projecting considerably, against which the sea breaks with great violence. It is the continuation of this reef that joins Lefooga to Foa, which is but half a mile distant; and, at low water, the natives can walk upon this reef from one island to the other. The shore is either a sandy beach, or a coral rock. When the Captain returned on board from his excursion, he found a large sailing canoe fastened to our stern. In this came Latooliboula, or Kohagee too Fallangou, (one perhaps the name of the person, and the other the description of his rank or title) whom the captain had seen, during his last voyage, at Tongataboo, and who was then supposed by him to be the king of that island. He could not be prevailed upon to come on board, but continued sitting in his canoe with an uncommon air of gravity. The islanders called him Areekee, or king, a title which we had not heard any of them give to Feenou, however extensive his authority over them had appeared to be. Latooliboula remained under our stern till the evening and then departed. Feenou was on board the Resolution at that time, but neither of these chiefs took the smallest notice of each other.

On Thursday the 22nd, some of the natives having stolen a tarpaulin and other things from off the deck, the captain applied to Feenou, desiring him to exert his authority to get them restored; but this application was of no effect. On the 23d, as we were preparing to leave the island, Feenou and his prime-minister Taipa came along-side in a canoe, and informed us, that they were going to Vavaoo, an island, as they said, situated about two days sail to the northward of Hapae. They assured us, that the object of their voyage was to procure for us an additional supply of hogs, besides some red feathered caps for Omiah, to carry with him to Otaheite; and desired us not to sail till their return, which would be in four or five days; after which Feenou would accompany us to Tongataboo. Captain Cook consented to wait the return of this chief, who immediately, as he pretended, set out for Vavaoo. On the 24th, a report was industriously spread about by some of the islanders, that a ship resembling ours had arrived at Annamooka since we left it, and was now at anchor there. It was also said, that Toobou, the chief of that island, was hastening thither to receive those new visitors. Upon enquiry, however, it was found, that this report was totally void of foundation. It is difficult to conjecture, what purpose the invention of this tale could answer; unless we suppose it was contrived with a view of getting us removed from

No. 55.

one island to another. On the 25th, we went into a house where a woman was dressing the eyes of a child, who seemed blind. The instruments used by this female oculist were two slender wooden probes, with which she brushed the eyes so as to make them bleed. In the same house we found another woman shaving a child's head with a shark's tooth, stuck into the end of a stick. She first wetted the hair with a rag dipped in water, and then applying the instrument, took off the hair as close as if a razor had been used. Captain Cook soon after tried upon himself one of these remarkable instruments, and found it to be an excellent substitute. The natives of these islands, however, have a different method of shaving their beards, which operation they perform with two shells, one of which they place under a part of the beard, and with the other applied above, they scrape off that part: in this manner they can shave very close, though the process is rather tedious. There are among them some who seem to make this a profession; for it was common for our sailors, when ashore, to have their beards scraped off, after the mode of Hapae, as it was for their chiefs, when on board, to be shaved by our barbers. Finding at this time, that little or nothing of what the island produced was brought to the ships, Captain Cook determined to change our station, and to wait Feenou's return in some other anchoring-place, where we might still be supplied with refreshments; accordingly,

On Monday the 26th, in the forenoon, we made sail to the southward along the reef of the island, and having passed several shoals, hauled into a bay, that lies between the north end of Hoolaiva, and the south of Lefooga, and there anchored in 17 fathoms water, the point of Lefooga bearing S. E. by E. distant a mile and a half. The Discovery did not cast anchor till sun-set; she having touched on one of the shoals; but backed off again without receiving the least damage. We had no sooner cast anchor, than Mr. Bligh, master, was sent to found the bay, where we were now stationed; and Captain Cook, accompanied by Lieutenant Gore, landed on the southern part of Lefooga, to look for fresh water, and examine the country. On the west-side of the island they observed an artificial mount of considerable antiquity, about 40 feet high, and measuring 50 feet, in the diameter of its summit. At the bottom of this mount was a stone 14 feet high, two and a half thick, and four broad, hewn out of coral-rock; and we were told by the islanders, that not more than half its length was seen above ground. They called it Tangata Areekee (Tangata in their language signifies man; Areekee, king) and said it had been set up, and the mount raised in memory of one of their kings. On the approach of night, the Captain and Mr. Gore returned on board, and Mr. Bligh came back from sounding the bay, in which he found from 14 to 20 fathoms water, with a bottom principally of sand. Lefooga and Hoolaiva are separated from each other by a reef of coral-rocks, dry at low water. Some of our gentlemen, who landed in the last mentioned island, found not the smallest mark of cultivation, or habitation upon it, except a single hut, in which a man employed to catch fish and turtle resided. It is remarkable that it should remain in this desolate condition, since it communicates so immediately with Lefooga, which is so well cultivated. The west side of it has a bending, where there seems to be good anchorage; and the east-side has a reef, as well as Lefooga. Uninhabited as Hoolaiva is, an artificial mount has been raised upon it, equal in height to some of the surrounding trees.

On Tuesday the 27th, at day-break, signal was made to weigh, and as we intended to attempt in our run to Tongataboo, a passage to Annamooka, by the S. W. among the intermediate isles, Mr. Bligh was sent in a boat, to sound before the ships. But before we got under sail, the wind became so variable and unsettled, as to render it unsafe to attempt a passage with which we were so little acquainted: we therefore lay fast, and made signal for the master to return. He, and the master of the Discovery, were afterwards sent, each in a boat, to examine the channels. Towards noon, a

5 Y

large

large sailing canoe came under our stern, in which was a person named Poulaho, or Futtafaihe, who was said by the natives then on board, to be king of Tongataboo, Annamooka, Hapae, and all the neighbouring islands. We were surprised to find a stranger dignified with this title, which we were taught to believe appertained to another: but they persisted in their assertions, that the supreme dignity belonged to Poulaho; and now for the first time acknowledged, that Feenou was not the king, but a subordinate chief, though of great power. After this explanation, Poulaho was invited by the captain on board, where he was not an unwelcome guest, as he brought with him two fat hogs by way of present. This great personage, though not very tall, was extremely unweildy, and almost shapeless with corpulence. He appeared to be about forty: his hair was straight, and his features considerably different from those of the majority of his people. We found him to be a man of gravity and good sense. He viewed the ship, and the various new objects, with a particular attention; and asked many pertinent questions. When he had gratified his curiosity in looking at the cattle, and other novelties, he was requested to walk down into the cabin: to which some of his retinue objected, saying, that, if he should go down thither, it would doubtless happen that people would walk over his head; a circumstance that could not be permitted. When this objection was to be obviated, by ordering that no one should presume to walk over the cabin, Poulaho waved all ceremony and ventured down without any previous stipulation. He now appeared to be no less solicitous than his people were, to convince us that he was sovereign, and not Feenou. He sat down to dinner with us, but eat and drank very little; and afterwards desired the captain to accompany him on shore. Omiah was asked to be one of the party; but he was too faithfully attached to Feenou, to shew much respect to his competitor, and therefore declined the invitation. Captain Cook attended the chief in his own boat, having first made him such presents as exceeded his expectations; in return for which, Poulaho ordered two more hogs to be sent on board. The chief was then carried out of the boat, by his own subjects, on a board resembling a hand-barrow, and was seated in a small house near the shore. He placed the captain by his side; and his attendants formed a semi-circle before them, on the outside of the house. An old woman sat close to the chief, with a kind of fan in her hand, to prevent his being incommoded with the flies. The various articles which his people had procured by trading on board the ships, being now displayed before him, he attentively looked over them all, inquired what they had given in exchange, and, at length, ordered every thing to be restored to the respective owners, except one glass bowl which he reserved for himself. The people who paid this respect, first squatted themselves down before him, then deposited their purchases, and instantly retired. They observed the same ceremony in taking them away, and not one of them presumed to speak to him standing. His attendants, just before they left him, paid him obeisance, by bowing their heads down to the sole of his foot, and touching it with the upper and under side of the fingers of each hand. Captain Cook was charmed with the groveling submission, or, as he termed it, the decorum, that was paid by the slaves to their master on this occasion, having scarce seen the like any where, even among more civilized nations. Perhaps the captain had never visited Italy, and seen the ceremony of kissing the Pope's toe. The master having returned, informed us, that as far as he had proceeded, there was a passage for the ships, and tolerable anchorage; but that, towards the S. and S. E. he observed numerous shoals, breakers, and small isles. In consequence of this report, we relinquished all thoughts of a passage this way, and, being resolved to return to Annamooka by the same route which we had so lately experienced to be a safe one, we should have sailed the next morning, which was the 28th, if the wind had not been very unsettled; and in the night we had some heavy squalls, with thunder,

lightning, and rain, to which, at times, these islands are exposed. Poulaho came early on board, bringing a red-feathered cap as a present to the captain. These curiosities were greatly sought after by us, as we knew they would be highly valued at Otaheite; but not one was ever brought for sale, though very large prices were offered; nor could a person in either ship make himself the proprietor of one, except the two captains and Omiah. They are composed of the tail feathers of the tropic bird, intermixed with the red feathers of the parrot; and are made in such a manner, as to tie on the forehead without any crown; and are in the form of a semicircle, whose radius is 18 or 20 inches. Poulaho left the ship in the evening; but his brother, whose name was also Futtafaihe, and some of his attendants, remained all night on board.

On Thursday the 29th, at day-break, we weighed with a fine breeze at E. N. E. and made sail to the westward, followed by several of the sailing canoes, in one of which was Poulaho the king, who, coming on board the Resolution, enquired for his brother, and the others who had continued with us all night. We now found that they had staid without his permission; for he gave them such a reprimand as brought tears from their eyes; however, he was soon reconciled to their making a longer stay; for on his departure from the ship, he left his brother, and five attendants on board. We were also honoured with the company of a chief, named Tooboucetoa, just arrived from Tongataboo; who, as soon as he came, sent away his canoe, declaring, that he and five others who came with him, would sleep on board; so that the captain had, at this time, his cabin filled with visitors: this inconvenience he endured the more willingly, as they brought with them plenty of provisions as presents to him, for which they met with suitable returns. In the afternoon, the easterly wind was succeeded by a fresh breeze at S. S. E. Our course being S. S. W. we were obliged to beat to windward, and did but just fetch the northern side of Footooha by eight o'clock in the evening. The next day we plied up to Lopanga, and had soundings, under the lee or N. W. side, in 40 fathoms water; but the bottom being rocky, and a chain of breakers lying to the leeward, we stretched away for Kotoo, expecting to find better anchorage there. It was dark before we reached that island, where finding no convenient place to anchor in, we passed the night in making short boards. On the 31st, at day-break, we stood for the channel between Kotoo, and the reef of rocks lying to the westward of it; but on our approach, we found the wind insufficient to lead us through. We therefore bore up on the outside of the reef, and stretched to the S. W. till near twelve o'clock, when perceiving that we made no progress to windward, and being apprehensive of losing the islands, while we had so many natives on board, we tacked, stood back, and spent the night between Footooha and Kotoo. The wind now blew fresh, with squalls and rain; and, during the night, by a small change of the wind, we were very near running a-ground on a low sandy isle, named Pootoo Pootoa, encompassed with breakers. Our people having fortunately been just ordered upon deck, to put the ship about, and most of them being at their respective stations, the necessary movements were performed with judgement and alertness; and this alone preserved us from destruction. The Discovery being astern, was out of danger. This narrow escape so alarmed the natives who were on board, that they desisted with great earnestness, to be put on shore: accordingly, on the return of day-light, a boat was hoisted out, and the officer who commanded her was ordered, after landing them at Katoo, to sound for anchorage along the reef which projects from that island. During the absence of the boat, we endeavoured to turn the ships through the channel between the reef of Kotoo and the sandy isle; but meeting with a strong current against us, we were obliged to desist.

On Sunday the 1st of June, distant about four leagues, we saw the burning mountains, and about eleven o'clock A. M. cast anchor in a fine bay, in 50 fathoms water,

London: Published as the Act directs, by Messrs. Hoag, at the Kings Arms, N^o. 11, Borewater Row.

View on the ISLAND of ROTTERDAM

the sandy isle bearing E. by N. about one mile from the shore. Here we remained till the 4th, being frequently visited by the king, by Tooboucaita, and by people who came from the neighbouring islands to traffic with us. Mr. Bligh, in the mean time, was dispatched to sound the channels between the islands situate to the eastward; and Captain Cook himself landed on Kotoo, to take a survey of it. This island, on account of the coral reefs that environ it, is scarcely accessible by boats. Its N. W. end is low; but it rises suddenly in the middle, and terminates at the S. E. end in reddish clayey cliffs. It produces the same fruits and roots with the adjacent islands, and is tolerably well cultivated, though thinly inhabited. It is about two miles in length. In the absence of the captain our people were employed in cutting grafs for the cattle, and we planted some melon seeds. On our return to the boat, we passed by some ponds of dirty brackish water, and saw a burying-place, which was much neater than any one we had seen at Hapae. On the 4th, at seven o'clock, A. M. we made sail, with a strong gale at E. S. E. and, about five in the afternoon, reached Annamooka, where we moored in our old birth, which we had lately occupied: but the Discovery, not being able to beat up against the wind, did not arrive till seven in the evening. When casting anchor she drove, and, in less than an hour, was three leagues to leeward of us, and in the utmost danger of being wrecked. They were now employed in weighing up their anchor; and we sent a number of our hands seasonably to their assistance. The night was tempestuous, with a high sea. They laboured till four in the morning incessantly; yet made but little way to windward, notwithstanding the utmost exertions of their whole strength; but providentially the gale having subsided, they swayed the anchor, and before day-light was safely moored by our side. This day, being Thursday the 5th, Captain Cook went on shore, and found the islanders very busy in their plantations, digging up yams for traffic. In the course of the day not less than 200 of them assembled on the beach, and traded with great eagerness. It appeared that they had been very diligent, during our absence, in cultivating their several plantations; and we now observed many large plantain-fields, which places, in our late visit, we had seen lying waste. The yams were in the highest perfection; and we obtained a good quantity of them in exchange for iron. Before the captain returned on board, he visited the several places where we had sown melon and cucumber seeds; but found, to his great regret, that most of them had been destroyed by the vermin; though some pine-apples which had also been left, were in a thriving condition.

Friday the 6th, about noon, Feenou arrived from Vavaoo, and informed us that several canoes, laden with hogs and other provisions, had sailed with him from that island, but had been lost near Appy, the island in which the burning mountains are situated, in the late tempestuous weather, and every person on board them had perished. This melancholy tale did not gain much credit with us, as we were by this time sufficiently acquainted with the character of the relator. The truth perhaps was, that he had been unable to procure at Vavaoo the expected supplies; or, if he obtained any there, that he had left them at Hapae, which lay in his way back, and where he must have heard that Poulaho had come to visit us; who therefore, he knew, would, as his superior, reap all the merit and reward of procuring those supplies, without having had any participation of the trouble. The invention, however, of this tale at sea was not ill imagined; for we had lately had very stormy weather. On the 7th, Poulaho, and some other chiefs, who had been wind-bound with him arrived; at which time Captain Cook happened to be ashore with Feenou, who now appeared to be sensible of the impropriety of his conduct, in arrogating a character to which he had no just claim; for he not only acknowledged Poulaho as sovereign of Tongataboo, and the adjacent isles, but affected to insist much on it. The captain left him, and went to pay a visit to the

king, whom he found sitting with a few of the natives before him; but great numbers hastening to pay their respects to him, the circle enlarged very fast. When Feenou approached, he placed himself among the rest that sat before Poulaho, as attendants on his majesty. He at first seemed to be somewhat confused and abashed; but soon recovered himself. A very short conversation passed between these two chiefs, which none of us understood; nor were we satisfied with Omiah's interpretation of it: however, from what we observed, we were sufficiently undeceived as to Feenou's rank. Both the king and Feenou accompanied the captain on board to dinner; but Poulaho only sat at table. Feenou, after having made his obeisance in the usual mode, by saluting the foot of his sovereign with his head and hands, retired from the cabin; and it now appeared, that he could neither eat nor drink in the king's presence.

On Sunday the 8th, at eight o'clock, A. M. we weighed anchor, and set sail for Tongataboo, or Amsterdam Island, having a gentle breeze at N. E. We were accompanied by 14 or 15 sailing vessels, belonging to the islanders, every one of which out-ran the ships. Feenou was to have taken his passage in the Resolution; but preferred his own canoe; and put two men on board, as pilots, to conduct us to the best anchorage. The royal canoe was distinguished from the rest by a small bundle of grafs, of a red colour, fastened to the end of a pole, and fixed in the stern, in the same manner as our ensign staffs. At five in the afternoon we descried two small islands, at the distance of four leagues to the westward. One was called by our two pilots Hoonga Hapae, and the other Hoonga Tonga. They are situated in the latitude of 20 deg. 36 min. S. and about 10 leagues from the western point of Annamooka, in the direction of S. 46 deg. W. We were told only five men resided on Hoonga Hapae; and that Hoonga Tonga had no inhabitants. We continued a S. W. course till two o'clock, A. M. of the 9th, when we saw several little islands, beyond which appeared Eooa and Tongataboo. We now had 25 fathoms water, with a bottom of broken coral and sand; and the depth gradually decreased, as we approached the above-mentioned small isles, which lie ranged along the N. E. side of Tongataboo. Steering by the direction of our two pilots, for the widest space between those isles, we were insensibly drawn upon a large flat, upon which lay innumerable rocks of coral, below the surface of the sea. Notwithstanding our boats were founding a-head, and our utmost attention and care to avoid those rocks, we were unable to prevent the Resolution from striking on one of them: nor did the Discovery, though at our stern, escape better. Happy for us it was, that we had day-light and fine weather. By clapping the sails to the mast, and lightening the ship abaft, we swayed her off: and it fortunately happened, through the protection of an over-ruling providence, that neither of the ships stuck fast, nor sustained any damage. We now held on our course, and the moment we saw a place where we could anchor with any degree of safety, we came to; and the masters were dispatched with the boats to sound. Soon after we had cast anchor, several of the natives of Tongataboo came to us in their canoes, assuring us, that we should meet with deep water further in, free from rocks. Their intelligence was true; for, about four o'clock, the boats made a signal of having found good anchoring ground. We therefore weighed, and stood in till dark, when we anchored in nine fathoms water, with a clear sandy bottom. During the night, we had some rain; but early in the morning, the wind became southerly, and bringing on fair weather, we weighed again, and worked towards the shore of Tongataboo. While we continued plying up the harbour, the king frequently sailed round us in his canoe; and at the same time there was a great number of small canoes about the ships. Two of these not getting out of the way of the king's vessel, he ran quite over them with the greatest unconcern. Among those who came on board the Resolution was Orago, who had been so useful to Captain Cook, when he visited Tongataboo.

Tongataboo in his preceding voyage, and one Toobou, who had, at that time, attached himself to Captain Furneaux. Each of them brought yams and a hog, in testimony of friendship; for which they received a suitable return. We arrived at our intended station about two o'clock in the afternoon of the 10th. It was a very convenient place, formed by the shore of Tongataboo on the S. E. and two small isles on the E. and N. E. Here both ships anchored over a sandy bottom, where the depth of water was 10 fathoms. Our distance from shore exceeded a quarter of a mile. We were instantly surrounded by natives, who came to welcome us, and seemed overjoyed at our arrival. It has not been uncommon with some compilers of voyages, to stigmatize these islanders with the name of Savages, than which no appellation can be worse applied, for a more civilized people do not exist under the sun. During the whole time of our stay, we did not see one instance of disorder among them, nor one person punished for any misdemeanor by their chiefs. We saw but few quarrels among individuals; on the contrary, much mirth and seeming harmony were observable. Highly delighted with their shows and heivas, they spend their time in a kind of luxurious indolence, where all labour a little, but none to excess. The king paddles himself in his canoe, though he must have a tow-tow to help him to eat. This seems strange to an European, as it reduces a man to the condition of a child; and yet it is but one remove from what we see daily practised before our eyes. The gentleman has his table spread, his food of various sorts set before him; has all his apparatus made ready, his bread cut, his meat carved, and his plate furnished; he has his drink handed to him, and in short, every thing which the tropical king has, except only conveying his food to his mouth, which the chief thinks may as well be done by his tow-tow. Yet the omission of this single act of handing his meat and drink to his mouth, brings a term of reproach upon the chief, though, by the handiness of his servants in the services of the table, the European gains the character of the polite gentleman. Such and so slender are the refinements of nations; the barriers that divide indolence from sumptuousness; and the simplicity of a tropical chief from the magnificence of an European Prince.

In the afternoon, Captain Cook, attended by Omiah, some officers, and other gentlemen, landed on the island of Tongataboo. We found the king waiting our arrival on the beach, who, when we landed, conducted us to a small neat house near the woods, having an extensive area before it: this, he told the captain, was at his service, during his continuance in the island. Before we had been long in the house, a large circle of the natives had assembled, and seated themselves on the area. A root of the Kava plant being brought to the king, he commanded that it should be split into pieces, and distributed to several people of both sexes, who began to chew it, and soon prepared a bowl of their favourite liquor. Mean while, a baked hog, and a quantity of baked yams were produced, and divided into ten portions. These shares were given to some of those who were present, except one, which remained undisposed of, and which probably was reserved for the king himself. The liquor was next served out; and the first cup being brought to the king, he ordered it to be given to a person who sat near him: the second was also brought to him, which he kept: the third was presented to Captain Cook; but their mode of preparing the liquor having disgusted him, it was handed to Omiah. The remainder of it was distributed to different people; and one of the cups being carried to Poulaho's brother, he retired with this, and with his share of the provisions. Others also withdrew from the circle with their portions, because they could neither eat nor drink in his majesty's presence: but there were some of an inferior rank, who both eat and drank before him. Soon after, the greater part of them went away, carrying with them what they had not eaten of the share of the feast. We observed, that the servants who distributed the meat, and the Kava, delivered them sitting, not only to the

king but to others who were partakers of this feast: but not a fourth part of the company had tasted either the victuals or the drink. The greatest good order was preserved throughout the assembly; and though a great many people were present who had never seen us before, yet no one was troublesome. Before the captain returned on board, he went in search of a watering-place, and was conducted to some ponds, in one of which the water was tolerable, but it was at some distance inland.

Wednesday the 11th, the Captain being informed, that the small island of Pangimodoo, near which the ships were stationed, could better supply that important article, he went over to it, and found there a pool containing fresher water than any we had met with among these islands. This pool being extremely muddy, he caused it to be cleaned; and here it was that we filled our water-casks. The same morning a tent was pitched near the house which the king had assigned for our use. The horses, cattle, and sheep, were then landed, and a party of marines stationed there as a guard. The observatory was set up at an inconsiderable distance from another tent; and Mr. King took up his residence on shore, to direct the observations, and superintend all other necessary business. A party was stationed to cut wood for fuel, and planks for the ships; and the gunners were appointed to conduct the traffic with the inhabitants, who flocked from all parts of the island with hogs, yams, cocoa-nuts, and other articles, in so much, that our land-station resembled a fair, and our ships were remarkably crowded with visitors. Feenou residing in our neighbourhood, we had daily proofs of his generosity and opulence, by the continuation of his valuable donations. Poulaho was equally attentive to us in this respect, as scarcely a day passed without his favouring us with considerable presents. We were now informed, that a person, named Mareewagee was of very high rank in the island, and was treated with great reverence; nay if our interpreter, Omiah, did not misunderstand his informers, that he was superior to Poulaho himself; but that, being advanced in years, he lived in retirement, and therefore was not inclined to pay us a visit. This intelligence having excited the curiosity of Captain Cook, he signified to Poulaho his intention of waiting upon Mareewagee; and the king having agreed to accompany him, they set out early on Thursday the 12th, in the pinnace, Captain Clerke joining them in one of his own boats. They then proceeded to the eastward of the little isles which form the harbour, and turning towards the south, entered a spacious bay, up which they rowed about three miles, and landed amidst a great concourse of people, who received them with shouts and acclamations. The crowd instantly separated, that Poulaho might pass, who took our gentlemen into a small enclosure, and then the king changed the piece of cloth he wore, for a new piece, very nearly folded: an old woman assisting in dressing him, and put a large mat over his cloth. Being now asked, where Mareewagee was, to our great surprise, he said, that he was gone down to our ships. He now requested us to accompany him to a malace, or house of public resort; and when we came to a large area before it, he seated himself in the path, while, at his desire, we walked up to the house, and sat down in the front. After waiting a little while, we repeated our enquiries, by the medium of Omiah, whether we were to be introduced to Mareewagee? But receiving no satisfactory answer, and being inclined to suspect, that the aged chief was purposely concealed from us, we returned to the boats much piqued at our disappointment. It afterwards appeared that Mareewagee had not been there; and that, in this affair, some gross mistakes had been made, Omiah either having been misinformed, or having misunderstood what was told him concerning the old chief. In this excursion, the place we went to was a very pleasant village, delightfully situated on the banks of the bay or inlet, where most of the principal persons of the island reside. Each of these has his house in the midst of a small plantation, with out-houses and offices for servants. These plantations are neatly fenced round,

The Reception of Capt. Cook, in Hapaii.

THE RECEPTION OF THE ENGLISH VOYAGERS IN THE HAPAII ISLANDS.

round, and, in general, have only one entrance, which is by a door fastened on the inside with a prop of wood. Between each plantation are public roads and narrow lanes. A considerable part of some of these enclosures is laid out in grass-plots, and planted with such things as seem less adapted for use than ornament. In such other plantations as were not the residence of persons of high rank, every article of the vegetable produce of the island was in great plenty. Near the great roads are some large houses, with spacious grass-plots before them, which were said to belong to the king, and are probably the places where public assemblies of the people are held.

Friday the 13th, about noon, Mareewagee came within a small distance of our post on shore, attended by a great number of people of all ranks. In the course of the afternoon, the two captains, and others of our gentlemen, accompanied by Feenou, went ashore to visit him. We found a grave person sitting under a tree, with a piece of cloth about 40 yards long, spread before him, round which numbers of people were seated. We supposed this to be the great personage, but were informed by Feenou, that another who was sitting on a piece of mat, was Mareewagee. To him we were introduced, and he received us very graciously. This chief, who was also under a tree, was named Toobou, whom we shall call old Toobou, to distinguish him from his name-sake, who has already been mentioned as Captain Furneaux's friend. Both he and Mareewagee were venerable in their appearance. The latter was slender in his person, and seemed to be near 70 years of age. Old Toobou, who desired us to sit down by him, was somewhat corpulent, and almost blind from a disorder in his eyes. The captain, not expecting on this occasion, to meet with two chiefs, had brought on shore a present for only one: this, therefore, he was obliged to divide between them; but, as it happened to be considerable, both of them appeared to be satisfied. Our party now entertained them about an hour with two French horns and a drum; but the firing off one of Captain Clerk's pocket-pistols seemed to please them most. Before we took leave of the two chiefs, the large piece of cloth was rolled up and presented to Captain Cook, together with a few cocoa-nuts. On the 14th, Old Toobou came on board to return our visit: he also went on board the *Discovery*; and if our former present was not sufficiently considerable, the deficiency was now supplied. In the mean time, Mareewagee went to see our people who were stationed on shore; and Mr. King shewed him whatever we had there. He was struck with admiration at the sight of the cattle; and the cross-cut saw rivetted his attention. Towards noon Poulaho came on board, bringing with him his son, who was about twelve years of age. The king dined with Captain Cook; but the son, though present, was not permitted to sit down by him. The captain found it very convenient to have Poulaho for his guest; for, whenever he was present, which frequently happened, every other native was excluded from the table: whereas, if neither he nor Feenou were on board, the chiefs of inferior rank were very importunate to be of the dining party, or to be admitted at that time into the cabin, which became consequently very much crowded. The king was soon reconciled to our cookery, and was fond of our wine. He now resided at the malae near our tent, where he this evening entertained our people with a dance, in which he himself, though so corpulent and unweildly, engaged.

Sunday the 15th, in the morning, Captain Cook received a message from Old Toobou, importing, that he was desirous of seeing him on shore. He and Omiah accordingly waited on that chief, whom they found sitting, like one of the ancient patriarchs, under the shade of a tree, having a large piece of cloth, the manufacture of the island, spread out before him. He desired them to place themselves by him: after which he told Omiah, that the cloth, with some cocoa-nuts, and red feathers, constituted his present to Captain Cook. The latter thanked him for the favour, accompanied with a request, that he would go on board with him. Omiah,

being sent for by Poulaho, now left the captain, who was informed by Feenou, that young Fattafaihe, the king's son, desired to see him. He immediately obeyed the summons, and found Omiah and the young prince seated under a canopy of fine cloth, with a piece of a coarser kind, 76 yards long, and seven and a half broad, spread before them and under them. On one side was a quantity of cocoa-nuts; and, on the other, a large board. A multitude of people sat round the cloth, among whom was Mareewagee, with other persons of rank. The captain was requested to seat himself by the prince; and then Omiah informed him, that he had been instructed by Poulaho to tell him, that as his majesty and the captain were friends, he hoped that his son Fattafaihe might be comprehended in this union; and that the captain, as a testimony of his consent, would accept of the prince's present. Our commander readily agreed to this proposal, and invited all the chiefs to dine with him on board. Accordingly, the young prince, Old Toobou, Mareewagee, three or four subordinate chiefs, and two old ladies of high rank, accompanied us to the ship. Mareewagee was dressed in a new piece of cloth, with six patches of red feathers on the skirts of it. This dress was probably made on purpose for this visit; for as soon as he arrived on board, he put it off, and presented it to our captain. When dinner was served up, not one of them would even sit down, or eat a morsel of any thing, as they were all taboo, they said; which word, though it has a very comprehensive meaning, signifies, generally, that a thing is prohibited. Why they were thus restrained at present, was not accounted for. Having made presents to them all, and gratified their curiosity, by shewing them every part of the ship, the captain conducted them ashore. When the boat had reached the land, Feenou, and several others, immediately stepped out; and the young prince following them, was called back by Mareewagee, who now paid the heir apparent the same obeisance which the king was accustomed to receive; and when Old Toobou, and one of the ladies, had honoured him with the same marks of respect, he was suffered to land. After this ceremony, the old people stepped out of the boat into a canoe, which was waiting to convey them to their place of residence. Captain Cook was pleased at being present on this occasion, as he was thus furnished with the most convincing proofs of the supreme dignity of Poulaho and his son. By this time, indeed, we had gained some certain information with regard to the relative situation of several chiefs. We now knew, that Old Toobou and Mareewagee were brothers. Both of them were men of considerable property, and in high estimation with the people: Mareewagee, in particular, had obtained the honourable appellation of Motooa Tonga, which implies, father of Tonga, or his country. We also now understood, that he was the king's father-in-law, Poulaho having espoused one of his daughters, by whom he had young Fattafaihe; so that Mareewagee was grand-father to the prince. As to Feenou, he was one of the sons of Mareewagee, and Tooboucitoa was another. On landing, we found Poulaho in the house adjoining to our tent, who immediately made Captain Cook a present of a hog, and a quantity of yams. Towards evening a number of the islanders came, and having seated themselves in a circle, sung in concert with the music of bamboo drums, which were placed in the centre. Three of them were long ones, and two were short. With these they struck the ground end-wise. There were two others that lay side by side on the ground, one of which was partly split: on these a person continued beating with two sticks. They sung three songs during our stay, and the entertainment lasted, after we left them, till ten o'clock. For light, they burned the leaves of wharra palm. In the mean time Mr. Anderson, with several other gentlemen, made an excursion into the country, by whom we were furnished with the following observations. Westward of the tent, the country for about two miles, is entirely uncultivated, though covered with trees and bushes growing naturally with the greatest vigour. Beyond this a pretty large plain

extends itself, on which are cocoa-trees, and some small plantations. Near the creek, which runs west of the tent, the land is perfectly flat, and partly over-flowed every tide by the sea. When the waters retire, the surface is seen to consist of coral rock, interspersed with holes of yellowish mud; and near the edges, where it is rather more firm, are vast numbers of little openings, whence issue innumerable small crabs, which swarm upon the spot, but are so very nimble, that, when approached, they instantaneously disappear, and baffle all the dexterity of the natives who endeavour to catch them. At this place is a work of art, which testifies some degree of ingenuity and perseverance. On one side is a narrow causeway, which, gradually increasing in breadth, rises with a gentle ascent to the height of 10 feet, where its breadth is five paces, the whole length being about 74 paces. Adjacent to this is a kind of circus, 30 paces in diameter, about one or two feet higher than the causeway that joins it; and in the middle of this circus some trees are planted. On the opposite side, another causeway descends, which is partly in ruins, and not above 40 paces in length. The whole is built of large coral-stones, with earth on the surface, overgrown with shrubs and low trees. From the marks of decay in several places, it is probably of some antiquity: but it seems to be of no service at present, whatever may have been its use in former times. All that could be learnt of the natives was, that it was called Etchee, and belonged to Poulaho, the king.

Monday the 16th, in the morning, Captain Cook, Mr. Gore, and others, took a walk into the country; in the course of which we met with an opportunity of seeing the whole process of making cloth, the principal manufacture of this island, as well as of many others in the South Sea. An account of this operation as performed at this place, may not improperly be subjoined here. The manufacturers, who are of the female sex, take the slender stalks or trunks of the paper mulberry, which rarely grows more than seven feet in height, and about the thickness of four fingers. From these stalks they strip the bark, and scrape off the exterior rind; after which the bark is rolled up, and macerated for some time in water: it is then beaten with a square instrument of wood, full of coarse grooves, but sometimes with a plain one. The operation is often repeated by another person; or the bark is folded several times, and beat longer, which is probably intended to close rather than divide its texture. It is then spread out to dry; the pieces being from four to six or seven feet in length, and about half as broad. These pieces are joined by smearing part of them with the glutinous juice of a berry, called tooo; and after being thus lengthened, they are placed over a large piece of wood, with a sort of stamp, composed of a fibrous substance, laid beneath them. The manufacturers then take a bit of cloth, and having dipped it in a juice expressed from the bark of a tree, called Kokka, rub it briskly over the piece that is making. This leaves upon the surface a dry gloss, and a dull brown colour; and the stamp makes, at the same time, a slight impression. Thus they proceed, joining and staining by degrees, till a piece of cloth, of the requisite length and breadth, is produced. They generally leave a border, about a foot broad, at the sides, and rather longer at the ends, unstained. If any parts of the original pieces have holes, or are too thin, they glue spare bits upon them, till their thickness equals that of the rest. Whenever they are desirous of producing a black colour, they mix the juice of the Kokka with the foot procured from an oily nut, called dooedooe. They assert, that the black cloth, which is usually most glazed, makes a cold dress; but the other a warm one. On our return, we met with Feenou, whom we took with us, and another young chief, on board to dinner; which when served up, neither of them would eat a morsel; saying that they were taboo avy: but when they found, that, in dressing the pig and some yams, no avy (or water) had been made use of, they both sat down, and eat very heartily: they drank also our wine, on being assured no water was

in it; from whence we inferred, that they were at this time, for some particular reason, forbidden to use water; or that, perhaps, they did not like the water we then used, it being taken out of one of the places where in the islanders bathed.

Tuesday the 17th, was fixed upon by Marceewagee for giving a grand haiva, or entertainment, and we were all this day invited to attend. Before the temporary hut of this chief, and near our land station, a large space had been cleared for that purpose. In the morning vast numbers of the natives came in from the country, every one of whom bore on his shoulder a long pole, at each end of which a yam was suspended. These poles and yams being deposited on each side of the open space, or area, formed two large heaps, piled up to the greatest advantage, and decorated with small fish of various kinds. They were a present from Marceewagee to the two Captains Cook and Clerke. The necessary preparations being made, the islanders began about eleven o'clock, to exhibit those dances which they call Mai. The band of music, at first, consisted of 70 men as a chorus, amidst whom were placed three instruments, which we called drums, though they did not much resemble them. They are cylindrical pieces of wood, from three to four feet in length, some of them, trunks of trees, twice as thick as a man of ordinary size, and some smaller. They are entirely hollow, but close at each end, and open only by a chink, about three inches in breadth, running nearly the length of the drum. By this opening the rest of the trunk is hollowed; which must be an operation of some difficulty. This musical instrument is called by the natives Nassa; and having the chink turned towards them, they sit and beat vigorously upon it, with two cylindrical pieces of wood, as thick as the wrist, and about a foot in length, by which means a rude, but loud and powerful sound is produced. They vary at intervals, and occasionally the strength and rate of their beating, and likewise change the tones, by beating towards the end or middle of the instrument.

In the first dance were four ranks of 24 men each. These held in their hands a small thin wooden instrument, about two feet in length, resembling in its shape an oblong paddle. With these instruments, which are called pagge, they made different motions; such as pointing them to the ground on one side, and, at the same instant, inclining their bodies the same way; then shifting them to the opposite side in the same manner, and with similar inclinations; passing them with great quickness from one hand to the other, and twirling them about with remarkable dexterity, and various manœuvres. Their motions, which were slow at first, quickened as the drums beat faster; and they repeated sentences the whole time in a musical tone, which were answered by the chorus; but in a short time they all joined, and ended with a shout. After a cessation of a few minutes, they began as before, and continued with short intervals, upwards of a quarter of an hour; and then the rear rank dividing, moved slowly round each end, met in the front, and formed the first rank; during which movements the whole number of performers continued to recite sentences. The other ranks did successively the same, till that which was foremost became the rear; and this evolution did not cease till the last rank regained its former situation. A much quicker dance, though slow at first, was then begun, and they sung for ten minutes, when the whole body, in a two-fold direction, retreated, and then advanced, forming nearly a circular figure, which concluded the dance; the chorus retiring, and the drums being removed at the same time. In the second dance, were 40 men as a chorus, with only two drums; and the dancers, or rather actors, consisted of two ranks, the foremost of which had 17 persons, and the other 15. Feenou was in the middle of the first rank, which is considered, on these occasions, as the principal place. They danced and repeated sentences with very short intervals, for half an hour, sometimes slowly, and at other times quickly, with the highest degree of exactness and regularity. Towards the close,

the rear rank divided, came round, and occupied the place of the front, which afterwards resumed its former situation. This dance being finished, the drums were taken away, and the chorus retired, as in the preceding dance. Three very large drums were now brought in, and 70 men formed a chorus to the third dance. This consisted of two ranks, of 16 men each, having young Toobou at their head, who was splendidly ornamented with a kind of garment covered with red feathers. These performers danced, sung, and twirled the pagge, so as to meet with the continual applauses of the spectators, who were particularly pleased with one attitude, in which they held the face aside, as if ashamed, with the pagge before it. The hindmost rank closed before the front one, which soon after resumed its place, as in the first and second dances: then beginning again, they formed a triple row, divided, retreated to each end of the area, and left the ground almost clear. Two men rushing in at that instant, began to exercise their clubs which they make use of in battle. They first twirled them in their hands, and made circular strokes before them with great quickness, managing them with such skill, that, though they stood close to each other, they never interfered. They shifted the clubs, with uncommon dexterity, from one hand to the other; and, after some time, kneeled down, and made various motions, tossing up their clubs in the air, and catching them as they fell. They then retired as hastily as they entered. Their heads were ornamented with pieces of white cloth, fastened at the crown, with a wreath of foliage round their foreheads: and, that they might be free from every incumbrance, they had only a very small piece of cloth tied round the waist. A man armed with a spear, now rushed in, and put himself in a menacing attitude, as if he intended to strike with his weapon at one of the people in the crowd; at the same time bending the knee a little, and trembling as it were with fury. He continued in this position near a minute, and then moved to the other side, where, having stood in the same posture, he hastily retreated from the area. During all this time the dancers, who had divided themselves into two parties, continued to repeat something slowly; and they now advanced, and joined again, concluding the dance with general applause. This dance, in our opinion, was considered as a capital performance, as some of the principal people were engaged in it; one of the drums being beat by Futtafaihe, the king's brother, another by Feenou, and the third by Mareewagee himself. In the fourth and last dance, were 40 men as a chorus, with two drums. The performers were 60 men, arranged in three rows, having 24 in front. Before they began, we were entertained with a preliminary harangue, in which the whole number made responses to a speaker *solus*. They then recited sentences alternately with the chorus, and made with the pagge many quick motions. They divided into two parties, with their backs to each other; formed again; shifted their ranks, divided, and retreated; being succeeded by two men, who exercised with their clubs, as before, after whom came two others; the dancers in the mean time repeating in their turns with the chorus; they then advanced, and concluded the dance.

These amusements continued from eleven o'clock till near three. The number of islanders who attended as spectators, together with those who were round the trading-place at the tent, or straggling about, amounted to at least 10,000, all within the compass of a quarter of a mile. Had we understood what was spoken in this entertainment, we might probably have gained much information with respect to the genius and customs of this people. Though the spectators constantly applauded the different motions, when well made, a considerable share of the pleasure they received, seemed to arise from the sentimental part, or, what the performers recited. However, the mere acting part well deserved our notice, on account of the extensiveness of the plain, the variety of the motions, and the exact unity, ease, gracefulness, and vivacity, with which they were performed. In the evening we were enter-

tained with the Bomai, or night dances, on a large area before the temporary dwelling place of Feenou. They continued three hours; during which time about twelve of them were performed, nearly in the same manner as those at Hapae. In two of them, in which some women had a part, a number of men came, and formed a circle within their's. In another, which consisted of 24 men, many motions that we had not seen before, were made with the hands, and met with great applause. The music was once changed in the course of the evening; and in one of the dances, Feenou himself appeared at the head of 50 men. He was neatly dressed in linen, and some small pictures were hung round his neck. After these diversions were ended, we were made sensible, that these people had put themselves to many inconveniencies on our account: for being drawn together to this uninhabited part of the island, numbers of them were obliged to lie down and sleep under the bushes, or by the side of a tree, or a canoe, nay, many lay down in the open air, which they are not fond of, or spent the remainder of the night in walking about. Notwithstanding the whole entertainment was conducted with better order than could reasonably be supposed, yet our utmost care and attention could not prevent our being plundered by the natives in the most insolent manner: but then it must be acknowledged, that among such a multitude, there must be a number of ill-disposed people, and we hourly experienced their propensity to thieving in every quarter. There was scarcely any thing which they did not endeavour to steal. In the middle of the day, they once attempted to take an anchor from off the *Discovery's* bows, but without effect. The only violence of which they were guilty, was, the breaking the shoulder-bone of one of our goats; in consequence of which she died soon after.

On Wednesday the 18th, one of the islanders got out of his canoe into the quarter gallery of the *Resolution*, and stole from thence a pewter basin; but being detected he was pursued, and brought along-side the ship. Upon this occasion, three old women in the canoe made loud lamentations over the prisoner, bearing their faces and breasts with the palms of their hands, in a very violent manner. This mode of expressing sorrow occasions the mark which most of these people bear over their cheek-bones; for the repeated blows inflicted by them on this part rub off the skin, and cause some blood to flow out; and when the wound is green, it looks as if a hollow circle had been made by burning. On some occasions, they cut this part of the face with an instrument. A gentleman, who was on board the *Discovery*, has informed the writer of the history of these voyages, that he had an opportunity of discovering the reason of a very singular mark, a little above the temples of many of the chiefs. In one of our excursions into the country, says this gentleman, we perceived the day was kept sacred throughout the whole island; that nothing was suffered to be sold; neither did the people touch any food; and besides, that several of our new acquaintance were missing. Enquiring into the cause, we were told, that a woman of quality was dead, and that the chiefs, who were her descendants, stayed at home to have their temples burnt. This custom is not confined to this island only, but is likewise common to several others, particularly, to those of Ea-oowee, or Middleburgh, and Appee. This mark is made on the left-side, on the death of a mother, and on the right-side when the father dies; and on the death of a high-priest, the first joint of the little finger is amputated. These people have therefore their religious rites, though we were not able to discover how, or when they were performed.

This day Captain Cook bestowed some presents on Mareewagee, in return for those which had been received from that chief the preceding day; and as the entertainments then exhibited called upon us to make some exhibition in return, he ordered all the marines to go through their exercise, on the spot where the late dances had been performed, and, in the evening, some fire-works were also played off at the same place;

place. The king, the principal chiefs, and a vast multitude of people, were present. The platoon firing seemed to please them; but when they beheld our water rockets, they were filled with admiration and even astonishment. They did not much regard the fife and drum: nor the French horns that were playing during the intervals. Poulaho sat behind every one, no person being permitted to sit behind him: and that his view might receive no obstruction, none sat immediately before him: a lane was made by the spectators from him quite down to the space allotted for playing off the fire-works. While the natives were in expectation of seeing our exhibition, they engaged, for the greatest part of the afternoon, in wrestling and boxing. The first of these exercises they call *foohoo*, and the second *fangatoo*. When a person is desirous of wrestling, he gives a challenge by crossing the ground in a kind of measured pace, and clapping smartly on the elbow joint of one arm, which is bent, and sends forth a hollow sound. If no opponent steps forth, he returns and sits down; though sometimes he stands clapping his hands to provoke some one to accept his challenge. If an antagonist makes his appearance, they meet with marks of the greatest good nature, generally smiling, and deliberately adjusting the piece of cloth that is fastened round the waist. By this cloth they lay hold of each other, and he who succeeds in drawing his opponent to him, instantly endeavours to lift him upon his breast, and throw him upon his back; and if he can turn round with him, in that position, two or three times, before he throws him, his dexterity procures him numerous plaudits from the spectators. Should they be more equally matched, they quickly close, and attempt to throw each other by entwining their legs, or raising each other from the ground; in which struggles for victory they display an extraordinary exertion of strength and agility. When one of them is thrown, he immediately retires; while the conqueror sits down for near a minute, then rises, and goes to the place from whence he came, where the victory is proclaimed aloud. After having sat a short time, he rises again, and challenges; and if several antagonists enter the lists, he has the privilege of choosing which of them he pleases to engage with: he may also, should he throw his competitor, challenge again, till he himself is vanquished; in which case the people of the opposite side chant the song of victory in favour of their champion. It frequently happens, that five or six rise from each side, and give challenges together; so that it is not uncommon to see several sets engaged on the field at the same time. They preserve great temper in this exercise, and leave the spot without the least displeasure in their countenances. When they perceive, upon trial, that they are so equally matched, as not to be likely to throw each other, they leave off by mutual consent. Should it not clearly appear which of them has had a superior advantage over the other, both sides proclaim the victory, and then they engage again; but no one, who has been vanquished, is permitted to engage a second time with his conqueror. Those who intend to box advance sideways, changing the side at every pace, having one arm stretched out before, the other behind; and holding in one hand a piece of cord, which they wrap closely about it, when they meet with an opponent. This we think is intended to prevent a dislocation of the hand or fingers. Their blows are dealt out with great quickness and activity, and are aimed principally at the head. They strike equally well with either hand. One of their most dextrous blows is, to turn round on the heel, just after they have struck their adversary, and to give him another smart blow with the other hand backward. In boxing-matches, unless a person strikes his antagonist to the ground, they never sing the song of victory; which shews, that this diversion is less approved among them than wrestling. Not only boys engage in both these exercises; but it not unfrequently happens, that little girls box, for a short time, with great obstinacy. On all these occasions, they do not consider it as any disgrace to be vanquished, and he

who is overcome sits down with as much indifference as if he had never entered the lists. Some of our people contended with them in both exercises, but were generally worsted; except in a few instances, where, as Captain Cook observes, "it appeared, that the fear they were in of offending us, contributed more to the victory, than the superiority of the person they engaged."

On Thursday the 19th, Captain Cook thought proper to mark out his intended presents of animals, which he designed to leave behind him. He therefore assembled the chiefs before our house, and informed them of his proposed distribution before his departure. To Poulaho, the king, he presented an English bull and a cow; to Mareewagee a cape ram, and two ewes, and to Feenou a horse and a mare. Omiah was instructed to inform the chiefs, that no such animals existed within several months sail of their island; that we had brought them with much trouble and expence, for their use; that, therefore, they ought to be careful, not to kill any of them till they had multiplied considerably; and, finally, that they and their children ought to remember, that they had received them from the natives of Britain. Omiah also explained to them their respective uses, as far as his limited knowledge would permit, for he was not well versed in such things. The captain had intended to give old Toobou two or three goats; but finding that chief, who had not attended the meeting, though invited, indifferent about them, he added them to the share of Poulaho. As the captain intended, that the above presents should remain with the other cattle, till we were ready to sail, he desired each of the chiefs to send a man or two, to look after their respective animals, along with our people, in order that they might be made acquainted with the manner of our treating them. The king and Feenou did so; but neither Mareewagee, nor any other person for him, took the least notice of the sheep afterwards. Indeed, it soon appeared, that some were dissatisfied with our distribution of the animals; for on the 20th, early in the morning, two of our Turkey-cocks, and one kid were missing. Our commander being determined to have them restored, seized on three canoes that were along-side the ships: he then went on shore, and having found the king, his brother, Feenou, and some other chiefs, in our house, he immediately placed a guard over them, and intimated to them, that they must remain confined till not only the turkeys and kid, but the other articles of which we had been plundered, at different times, were restored to us. On finding themselves prisoners, they concealed their feelings, as well as they could; sat down to drink kava, with an appearance of unconcern; and assured the captain, that the things in question should all be returned. Soon afterwards, an axe, and an iron wedge were brought to us. In the mean time, some armed natives began to assemble behind the house, but they dispersed when a part of our guard marched against them; and the chiefs, by the advice of the captain, gave orders, that no more should appear. Upon being invited to dine with us on board, they readily consented. Some of them having afterwards objected to Poulaho's going, he rose up immediately, and declared, that he would be the first man. We all now repaired aboard, and the chiefs remained in the ships till four o'clock. They were then conducted by the captain ashore; and not long after their having landed, the kid, and one of the turkeys were restored to us. On their promising that the other turkey should be brought back the next morning, both they and their canoes were released. The chiefs having left us, we walked out, with Omiah in company, to observe how the natives in our neighbourhood fared, for this was the usual time of their meals. We found them in general, ill supplied; a circumstance not to be wondered at, since most of the yams, and other provisions they had brought with them, were disposed of to us; and they were unwilling to return to their own habitations, while they could procure any subsistence near our post. Our station was upon an uncultivated point of land; so that there were none of the natives

natives who had a fixed residence within half a mile of us. Those therefore who were at our post, were obliged to live under trees, or in temporary huts; and the cocoa-trees were stripped of their branches, for the purpose of erecting huts for the chiefs. In the course of our walk we found six women at supper, two of whom were fed by others. When Omiah asked the reason of this circumstance, the women replied taboo mattee. Upon further enquiry it appeared, that one of them, about two months before, had washed the corpse of a chief, on which account she was not allowed to handle any food for five months; and that the other had performed the same kind office to the dead body of a person of inferior rank, and was therefore under a similar restriction, though not for so long a space of time.

On Saturday the 21st, early in the morning Poulaho, the king, came on board, to invite Captain Cook to the diversions of a haiva, which entertainment he designed to give the same day. He had his head befmeared with pigment, in order to communicate a red colour to his hair, which was naturally of a dark brown. After breakfast, the captain attended him to the shore, and found the islanders very busy in two places, fixing in a square and upright position, four very long posts, at the distance of near two feet from each other. They afterwards filled up with yams the square between the posts; and fastened sticks across, from one post to another, at the distance of every four feet, to prevent the posts from separating, by the weight of the inclosed yams, and also to ascend by. As soon as the yams had reached the summit of the first posts, they continued to fasten others to them, till each pile was 30 feet or more in height. On the top of one of the piles, they placed two baked hogs; and, on the top of the other, a living one; and another they tied by the legs half way up. The facility and dispatch with which these two piles were raised, were very remarkable. "Had our seamen," observes Captain Cook, "been ordered to execute such a work, they would have sworn, that it could not be performed without carpenters; and the carpenters would have called to their aid a dozen different sorts of tools, and have expended, at least, a hundred weight of nails; and, after all, it would have employed them as many days, as it did these people hours. But seamen, like most other amphibious animals, are always the most helpless on land." Having completed these two piles, they accumulated some other heaps of yams, and also of bread-fruit, on each side of the area; to which a turtle, and a great quantity of fish were added. The whole of this, with some red feathers, a mat, and a piece of cloth, composed the king's present to Captain Cook; and Poulaho seemed to be not a little proud at having exceeded, as he really did, Feenou's liberality at Hapace. About one o'clock, the Mai, or dances, were begun. The first very nearly resembled, what was performed on the opening of Marcewagee's entertainment. The second was conducted by young Toobou; and in this four or five women were introduced, who equalled the men in the exactness and regularity of their motions. Near the end, the performers divided, in order to leave room for two champions, who exercised their clubs. In the third dance, which was the last, two other men, with clubs exhibited their skill and activity. The dances were succeeded by boxing and wrestling; and one man entered the lists with a heavy club made of the stem of a cocoa-leaf, but could meet with no opponent to engage him in so rough a diversion. Towards evening the Bomai, or night dances began, in which the king himself, apparelled in English manufacture, was a performer: but neither these, nor the dances in the day-time, were so capital as those given by Feenou and Marcewagee. The captain, in order to be present the whole time of the entertainment, dined on shore. Poulaho sat down by him, but would neither eat nor drink, which was owing to the presence of a female, who had been admitted, at his request, to the dining party, and who, as we were informed, was of superior rank to himself. This lady had no sooner dined than she walked up to the king, who

No. 56.

applied his hands to her feet; after which she retired. He immediately dipped his fingers into a glass of wine; and then all her attendants paid him obeisance. At his desire some of our fire-works were played off in the evening; but being damaged, they did not answer the expectations of the spectators.

No more entertainments being expected on either side, most of the natives had deserted us the day after Poulaho's haiva. Still, however, we had thieves about us, and experienced continual instances of their depredations. Mr. Nelson being alone, on the hills and rocks, collecting plants and herbs, and at a considerable distance from the ships, was attacked by five or six islanders, who first began by throwing stones, at which they are very dexterous; and then finding he had no fire-arms, closed in with him, stripped him of his cloaths, and bag, which were all that he had about him. Captain Cook complained to the king; but the offenders, upon enquiry, being found to be boys, and the cloaths, and bag of plants, of small value, Mr. Nelson, unwilling to embroil the inhabitants in any more disputes, interceded with the captain, as we were just upon our departure, not to make his loss an object of contention, but to take leave of the chiefs in the most friendly manner, who, upon the whole, had behaved with uncommon kindness and generosity. Some of the officers of both ships, who had made an excursion into the interior parts of the island, returned on the 22nd, in the evening, after an absence of two days. They had taken their muskets and necessary ammunition with them, besides several small articles, the whole of which the natives had the dexterity to steal from them, in the course of their short journey. Inconvenient consequences were likely to have attended this affair; for when our plundered travellers returned, they employed Omiah, without consulting Captain Cook, to complain to the king of the treatment they had received. He, not knowing how the captain would proceed in this affair, and apprehending that he might again lay him under restraint, set off early the next morning, and Feenou followed his example; so that not a chief of any authority was now remaining in this neighbourhood. The captain was much offended at this officious interference, and reprimanded Omiah for the same. Upon this Omiah endeavoured to bring back his friend Feenou, and he succeeded in his negotiation, by assuring him, that no violent measures would be pursued to oblige the natives to return the stolen things. Trusting to this declaration, Feenou came back in the evening, and was received favourably. Poulaho also honoured us with his company the next day. The two chiefs, upon this occasion, very justly observed to us, that, whenever any of our people wanted to take an excursion into the country, they ought to be made acquainted with it, that they might order proper people to attend them, to prevent such outrages. Though the captain did not afterwards endeavour to recover the articles taken upon this occasion, the whole of them were returned, through the interposition of Feenou, except one musket, and a few other trifles. By this time also, we recovered the tools and other matters that had been stolen from our workmen. In a journal belonging to a person on board the *Discovery*, we find the following remark: "During our stay here, more capital thefts were committed, and more Indians punished than in all the Friendly Islands besides: one was punished with 72 lashes, for stealing only a knife; another with 36, for endeavouring to carry off two or three drinking glasses; three were punished with three dozen each, for heaving stones at the wooders; but, what was still more cruel, a man for attempting to carry off an axe, was ordered to have his arm cut to the bone; which he bore without complaining. It is not to be wondered, that after such wanton acts of cruelty, the inhabitants should grow outrageous; and, though they did not break out into open acts of hostility, yet they watched every opportunity to be vexatious." This journalist cannot we think speak from his knowledge, and must have been misinformed; for, in the first place, we beg leave to observe, that such severe punishments as three and six do-

zen lashes are very seldom inflicted on board a king's ship, and then only for enormous offences; and, in the next place, the whole of the above memorandum contradicts all the most authentic accounts of the kind behaviour of the natives of the Friendly Isles, and likewise the well known humanity of our generous commander. We think it our duty to give a faithful detail of facts and occurrences, from the best authorities; nor is it less incumbent on us, to correct all errors and mistakes that may come under our observation: these two obligations have hitherto been the objects of our careful attention; and we hope, in the opinion of our friends and subscribers, we shall be found to have fulfilled them with a scrupulous punctuality.

Wednesday the 25th, two boats that had been sent in search of a commodious channel to sea, returned. Our people reported, that the channel to the north, through which we came in, was imminently dangerous, being full of coral-rocks; but that there was a good passage to the eastward, though contracted, in one place, by the small islands; consequently a westerly wind would be necessary to get through it. The ships being now completely stowed, having wood and water as much as they could make room for, with hogs and bread-fruit in abundance, in short everything they could contain, or the crews desire, orders were given to prepare for sailing; and we intended to visit the celebrated little island of Middleburgh, of which former voyagers have given a most flattering description: but as an eclipse of the sun was expected to be visible on the fifth of next month, the captain determined to stay till that time, in order to observe it. Having now some days of leisure before we set sail, a party of us, accompanied by Poulaho, set out the next morning, being Thursday the 26th, in a boat, for Mooa, a small village, where most of the great chiefs usually reside. Rowing up the inlet, we saw 14 canoes fishing in company, in one of which was Poulaho's son; they had taken some fine mullets, and put a dozen of them into our boat. In each canoe was a triangular net, extended between two poles, at the lower end whereof was a cod to receive and secure the fish. They shewed us their method of fishing, which appeared to be an effectual one. A shoal of fish was supposed to be upon one of the banks, which they instantly enclosed in a long net like our seine. This the fishermen, one getting into the water out of each boat, surrounded with the triangular nets in their hands, with which they scooped the fish out of the seine, or caught them as they attempted to leap over it. Taking leave of the prince and his fishing party, we rowed to the bottom of the bay, and landed where we had done before, when we went to visit Maveewagee. As soon as we landed, the king desired Omiah to tell me, that I need be under no apprehension about the boat, or any thing in her, for that not a single article would be touched, or purloined by any one of his people, which we found afterwards to be true. We were immediately conducted to one of Poulaho's houses, which, though tolerably large, seemed to be his private place of residence, and is situated within a plantation. The king seated himself at one end of the house, and his visitants sat down in a semi-circle at the other end. A bowl of Kava was speedily prepared, and directions were given to bake some yams. While these were getting ready, some of us, together with a few of the king's attendants, and Omiah as interpreter, walked out to take a view of a Fiatooka, or burying-place, at a small distance from the habitation. It belonged to the king, and consisted of three pretty large houses; situated on a rising ground, with a small one not far off, all standing in a line lengthwise. The largest of the three was the middle house, which was placed in an oblong square, 24 paces by 28, and elevated about three feet. The other houses were placed on little mounts. On the floors of these houses, as also on the tops of the mounts, were fine loose pebbles; and the whole was enclosed by large flat stones of coral-rock. One of the buildings was open on one side, and two wooden busts of men, rudely carved, were within it. We enquired of the natives

who followed us (but were not permitted to enter here), what these images were? Who informed us they were intended for memorials of some chiefs who had been buried in that place, and not meant as the representatives of any deity. Such monumental edifices, it is presumed, are seldom raised; for these appeared to have been erected many ages. We were informed, that dead bodies had been buried in each of these houses, but no traces of them were to be seen. The carved head of an Otaheite canoe, which had been driven ashore on their coast, was deposited in one of them. At the foot of the rising ground was a grass-plot, whereon different large trees were planted; among which were several large ones, called Etoa. They greatly resemble the cypresses, and have a solemn effect. A row of low palms was also planted near one of the houses. After having refreshed ourselves with some provisions, which we had brought from our ships, we took a pretty large circuit into the country, attended by one of the king's ministers, who would not suffer any of the rabble to follow us, and obliged those whom we met in our excursion, to sit down while we were passing; a mark of respect shewn only to their sovereigns. In our progress we observed the greatest part of the country to be cultivated; being planted with various kinds of productions, and most of these plantations were enclosed with fences. It is true, some spots were fallow; there were also others that remained in a state of nature; and yet even these last were of public utility, in affording the natives timber, as they were generally covered with trees. We saw likewise, in our walk, several large uninhabited islands (belonging as we were told to the king) many public roads, and abundance of foot-paths leading to every part of the island. Hence travelling was rendered easy and pleasant: but it is remarkable, that when we were on the most elevated spots of ground, 100 feet at least, above the level of the sea, we often met with the same coral rock found on the shore, projecting above the surface; and having all those inequalities, usually seen in rocks that lie within the wash of the tide; and yet, those very spots, almost wholly destitute of soil, were covered with luxuriant vegetation. Our guide conducted us to several little pools, and to some springs of water; but in general, they were either stinking or brackish; though thought by the natives to be excellent. The former were mostly inland, and the latter near the shore of the bay, and below high water mark; so that only when the tide was out tolerable water could be taken up from them.

In the dusk of the evening, we returned from our walk, and found our supper ready. It consisted of fish, yams, and a baked hog, in which all the culinary arts had been displayed. There being nothing to amuse us after supper, we lay down to sleep, according to the custom of the country, on mats spread upon the floor, and had a covering of cloth. The king, who had made himself very happy with some of our wine and brandy, slept in the house, as did many others of the natives. Before day-break, they all rose, and entered into conversation by moon-light. As soon as it was day, they dispersed different ways; but it was not long before they all returned, accompanied by several of their countrymen. While they were preparing a bowl of Kava, Captain Cook went to pay a visit to Toobou, Captain Furneaux's friend, who had a house not far distant, which, for size and neatness was hardly exceeded in the place. Here also we found a company preparing a morning draught. The chief made a present to the Captain of a live hog, and one that was baked; also a quantity of yams, and a large piece of cloth. When we returned to the king, we found him and his attendants drinking the second bowl of Kava. That being emptied, he informed Omiah, that he was immediately going to perform a mourning ceremony, called Tooge, in memory of a son who had been dead some time, and desired us to accompany him. Naturally expecting to see somewhat new and curious, we readily complied with his request. The first thing the king did, was to step out of the house, attended by two old women,

THE ENGRAVER OF THE FOREGOING SCENES IS THE LONDONER, J. G. COOPER.

A View of the Mountains near the City of Havana

women, and put on a new cloathing, over which was placed an old ragged mat, that might have served his great grandfather upon a similar occasion. His attendants were habited in the same manner, excepting that, in point of antiquity, none of their mats could vie with that of their master. Thus equipped, we marched off, preceded by eight or ten persons in the same uniform, each of them having likewise a green bough about his neck. Poulaho held his bough in his hand till he approached the place of rendezvous, when he also put it round his neck. We now entered a small inclosure, wherein was a neat house, and a man sitting before it. As the company entered, they took the branches from their necks, and threw them away. The king seated himself, and the rest of his people sat before him in the usual manner. By the arrival of other persons, the circle increased to upwards of an hundred, principally old men, all dressed in the manner above described. The company being assembled, a large root of Kava was produced by one of the king's servants, from whence was extracted liquor sufficient to fill a capacious bowl that would contain, at least, five gallons. Many persons now began to chew the root, and the bowl was filled up to the brim. Others were employed in making drinking cups of plantain leaves. The first cup that was filled, being presented to the king, he ordered it to be given to another person; the second was also brought to him, and he drank it; the third was offered to Captain Cook. Afterwards several cups were given to others, till the whole of the liquor was exhausted; and, though not half the company partook of it, no one appeared in the least dissatisfied. Each cup as it was emptied, was thrown upon the ground, whence it was taken up, and carried to be filled again. All this time the chief, and his whole circle, sat with a great deal of gravity, seldom speaking a word to each other. All this while we were in expectation of seeing the mourning ceremony begin, when, to our great surprise, as soon as the Kava was drank out, they all rose up and dispersed; Poulaho, at the same time, informed us, he was now ready to attend us to the ships. The Kava is a species of pepper, branching considerably, with large heart-shaped leaves, and jointed stalks. The natives esteem it a valuable article, taking great care to defend the young plants from injury, which they generally set about their houses. They do not often exceed, when full grown, the height of a man, though we have seen some much higher. The root is the only part used at these islands, from whence their favourite poration is extracted. The quantity put into each cup is about a quarter of a pint. It has no perceptible effect on these people, who use it so frequently; but on some of ours it operated like our spirits, occasioning intoxication, or rather stupefaction. The mourning ceremony being over, to our no small disappointment, we left Mooa, and set out on our return to the ships. Rowing down the inlet, we met with two canoes returning from fishing. Poulaho ordered them to approach him, and took from them every fish and shell. He afterwards stopped two other canoes, searched them, and found nothing. He gave us some of the fish, and the rest were sold by his servants on board the ship. Proceeding down the inlet, we overtook a large sailing canoe, when every person on board her sat down till we had passed; even the man who steered, though he could not possibly manage the helm, but in a standing posture. Having been informed by Poulaho and others, that there was some good water at Oney, a small island, about a league from the mouth of the inlet, we landed there, but found it extremely brackish. This island is quite in its natural state, and only frequented as a fishing-place; having nearly the same productions as Palmerston's Island. When we reached the ship, and got on board, we were informed, that every thing had continued quiet during our absence; not a single theft having been committed; of which Feenou, and Futtafaihe, the king's brother, who had undertaken the management of his countrymen, during our absence, boasted not a little. This evinces what power the chiefs have, when they are disposed to

execute it; which is not often to be expected; for whatever was stolen from us, was generally conveyed to them. But the good conduct of the natives was of short duration, for,

Saturday the 28th, six of them assaulted some of our people, who were sawing planks; in consequence of which they were fired at by our sentry: one of them was supposed to be wounded, and three were made prisoners. The latter were confined till night, when they were punished; and set at liberty. After this their behaviour was very decent and circumspect; occasioned, as we thought, by the man being wounded; for, till this time, they had only heard of the effect of our fire-arms, but now they had felt it. We were not mistaken in our conjecture, for Mr. King and Mr. Anderson, in an excursion they took into the country, met with the very man, and found indubitable marks of his having been wounded with a musket ball. Nothing worthy of notice happened at the ships for two days; we shall therefore fill up that interval with an account of Mr. Anderson's excursion into the country, just mentioned.

On Monday the 30th, Mr. King and Mr. Anderson accompanied Futtafaihe as visitors to his house, which is not far from that of his brother Poulaho, at Mooa. Soon after they arrived a good sized hog was killed, which was effected by repeated strokes upon the head. The hair was then curiously scraped off with the sharp edge of pieces of bamboo, and the entrails taken out by the same simple instrument. Previous to this an oven had been prepared, which was a large hole dug in the earth, the bottom of which was covered with stones, about the size of a man's fist, and made red hot by kindling a fire over them: they then wrapped some of those stones in leaves of the bread-fruit-tree, with which they filled the hog's belly; stuffing in a quantity of leaves, and a plug of the same kind, to prevent their falling out. This being done, the carcass was placed upon some sticks laid across the stones, and covered with plantain-leaves. The earth was afterwards dug up all round; and the oven being thus effectually closed, the operation of baking required no farther aid. While this was doing, our gentlemen amused themselves by walking about the country, but saw nothing remarkable, except a Fiatooka, about 30 feet high. At a small distance therefrom, were several Etooa-trees, whereon they saw a great number of Ternate-bats, making a most disagreeable noise. Not having their muskets with them at this time, they could not kill any, but some taken at Annamooka, measured almost a yard, when the wings were extended. On their return to Futtafaihe's dwelling, the baked hog was brought out, accompanied with some cocoa-nuts, and several baskets of baked yams. The person who prepared the hog in the morning, now cut it up in a masterly manner, with a knife made of split bamboo. Though the weight was, at least, nearly seven stone, the whole was placed before them; when they took a small part, and desired the rest might be distributed among the people sitting round. Futtafaihe could hardly be prevailed upon to eat a morsel. Dinner being ended, we went with him, and his attendants, to the spot where Poulaho's mourning ceremony was performed. They saw nothing but a kind of continuation of the same solemn rites, by way of condolence. Upon enquiring into the reason of this transaction, they were informed, that it was in memory of a chief who had long since died at Vavaoo; that they had practised it ever since, and should continue to do so for a considerable length of time to come. In the evening, they were entertained with a pig for supper, dressed like the hog, and, as that, accompanied with yams and cocoa nuts. When supper was over, a large quantity of cloth was brought for them to sleep on; but they were disturbed in their repose, by a singular piece of luxury, with which men of consequence in this island indulge themselves, namely, that of being thumped or patted, till and while they are asleep. Two women, who sat by Futtafaihe, performed this office, which they call *tooge tooge*, by striking his body and legs with both fists,

fists, till he fell asleep, and with some intervals, continued it the whole night. If the person is asleep, they abate a little of the strength and briskness of the beating: but if they observe the least appearance of his awaking, they resume it. In the morning they were informed, that Futtafaihe's women relieved each other, and went alternately to sleep. Such a practice as this, in any other country, would be supposed to be destructive of all rest; but here it operates like an opiate, and strongly points out what habit will effect. The noise occasioned by this extraordinary custom, was not the only bar to their sleeping; for the people who passed the night in the house, not only conversed frequently with each other, as in the daytime; but all got up before it was light, and made a hearty meal on fish and yams, which were brought to them by a person, who seemed to be well acquainted with the usual or appointed time of their nocturnal repast.

The next morning, being July the 1st, they walked down the east-side of the bay to the point, accompanied by Futtafaihe. The country appeared in a fine state of cultivation, but not so many inclosures as at Mooa; and among the great number of plantain-fields, there was one at least a mile long, in excellent order, every tree growing with great vigour. They found, that in travelling, Futtafaihe exercised a power, which evinced the great authority the principal men are invested with. To one place he sent for fish; to another for yams, &c. and his orders were as readily obeyed as if he had been absolute master of all the peoples property. When we came to the point something was mentioned by the natives concerning a man, who, they said, had been fired at by one of our guard; and upon our desiring to see the person, they conducted us to a house, wherein was a man who had been shot through the shoulder, but not dangerously. The ball had entered a little above the inner part of the collar-bone; and passed out obliquely backward. From the state of the wound, and several particular circumstances, we were certain, that he was the person who had been fired at by one of our sentinels, three days before; though positive orders had been given, that none of our people should load their pieces with any thing but small shot. There were many of them ready to swear they had loaded only with these; and how the single musket happened to be that day charged with ball, Captain Cook could never find out. Our gentlemen gave some directions how to manage the wound, to which no remedy had been applied; and the natives seemed pleased, when they were informed it would get well in a certain time. But on their departure, they requested of them to send the wounded man some yams, and other sorts of food; and in such a manner, that it was concluded they considered it to be our duty to support him, till he might be able to supply his wants with his own labour. They crossed the bay, in the evening, to our station, in a canoe procured by Futtafaihe, who exercised his authority by calling to the first that appeared. He had also brought to him at this place, by a servant, a large hog, and a bundle of cloth, which he wanted them to accept of as a present from him; but the boat being small, they objected; and he ordered it to be conveyed over to them the next day. Thus ends Mr. Anderson's account of his excursion.

On Wednesday the 2nd, Captain Cook examining the micrometer, belonging to the board of longitude, found some of the rack work broken, and that the instrument could not be repaired, nor rendered fit for use, by the time of the expected eclipse, though we had prolonged our stay with a view of making observations when this event should take place. Being thus disappointed in our expectation, we began to prepare for our departure, by getting this day on board all our cat-

tle, poultry, and other animals, except those that were destined to remain. The captain designed to have left a Turkey-cock and hen; but two hens having been destroyed by accident, and wishing to carry the breed to Otaheite, he reserved the only remaining pair for that place. We had brought three hens to these islands, one of which was strangled, and the other was killed by a useless dog belonging to one of our officers. The captain afterwards repented his not having given the preference to Tongataboo, as the present would have been more valued there than at Otaheite; and he was persuaded the natives of the former island would have taken more pains to multiply the breed. On the 3d, we unmoored, worked out of the bay, and moved the ships behind Pangimodoo, where we lay in readiness, to take the advantage of a favourable wind, to take us through the gut, in our way to Eooa-why, or Middleburgh. The king, who this day dined with us, took particular notice of the plates; which the captain observing, made him an offer of one, either of pewter, or earthen-ware: he made choice of the first, and mentioned the several uses to which he intended to apply it; two of which were so very extraordinary that they deserve to be related. Whenever he should visit any of the other islands, he said he would leave this plate behind him at Tongataboo, as his representative, that the people might, in his absence, pay it the homage due to himself in person. On being asked, how he had usually been represented in his absence, before he was in possession of a plate, he informed us, that this singular honour had always been conferred on a wooden bowl, in which he washed his hands. The other use to which he meant to apply the plate instead of the bowl, was to discover a thief. When any thing had been stolen, and the thief not detected, the people were assembled before him, when he washed his hands in the vessel. After this it was cleansed, and every man advanced, and touched it with his hand, in the same manner as they touch his foot when they offer him obeisance. If touched by the guilty person, he dropped down dead immediately; and if any one refused to touch it, such refusal was considered as a sufficient proof of guilt. On Saturday the 5th, the day of the eclipse, the weather in the morning was cloudy, with some showers of rain. About nine o'clock, the sun broke out at short intervals for about half an hour, but was totally obscured just before the commencement of the eclipse. The sun again appeared at intervals till about the middle of the eclipse; but was seen no more during the remainder of the day, so that we could not observe the end. This disappointment was the less to be lamented, as the longitude was sufficiently determined by lunar observations. The eclipse being over, we packed up the instruments, took down the observatories, and every thing was conveyed on board. None of the natives having taken the least notice or care of the sheep allotted to Mareewagee, the captain ordered them to be carried back to the ships. He was apprehensive, that if he should leave them there, they would probably be destroyed by the dogs. These animals did not exist upon the island in 1773, when Captain Cook first visited it; but there are now plenty of them among the chiefs, partly from the breed since that time, and partly from some imported from an island not very remote, called Feejee. At present, however, the dogs have not got into any of the Friendly Islands, except Tongataboo. We shall here add some particulars about this and its productions, for which we are indebted to Mr. Anderson. He spent many weeks upon it, and had many opportunities of gaining accurate information; and his researches will supply the imperfections or deficiencies, in our former account of this island; but for these particulars, we beg leave to refer our readers to the chapter following.

C H A P. VI.

Description of the island, animals, vegetables, &c. of Tongataboo, or Amsterdam—A solemnity at Mooa, called Natche, performed in honour of the king's son—Extraordinary processions and ceremonies—The manner of spending the night at the king's house—The solemnity continued, and conjectures concerning it—The Resolution and Discovery depart from Tongataboo, and arrive at Eoo-a—An account of that island—Transactions there—They weigh anchor and turn through the channel—Observations on the Friendly Islands—The number of islands and their names—Account of Vaváoo, Hamoa, and Feejee—The general character, persons, manners, customs, habits, and ornaments of the inhabitants described—Various employments of the women and men of the Friendly Islands—Their manner of agriculture and building their houses—Furniture, canoes, tools, cordage, and fishing-tackle—Weapons and instruments of music—Vegetable and animal food—Their method of cooking, diversions, marriage, and mourning ceremonies—Of their deities and religious opinions—Their Featookas—The power of their chiefs, form of government, and manner of paying homage to their sovereign—The royal family—Specimen of their language—Nautical remarks and other observations on the Tammabas and Iudes.

TONGATABOO, Amsterdam, or Tonga, (as it is sometimes called by the natives) is about 60 miles in circuit, rather oblong, though broadest at the east end, and its greatest length is from east to west. The south shore is straight, consisting of coral-rocks, eight or ten feet high, terminating perpendicularly, except in some few places, where it is interrupted by small sandy beaches, whereon, at low water, a range of black rocks may be seen. The west end is not above five or six miles broad, but has a shore somewhat like that of the south-side; whereas the whole north-side is environed with shoals and islands, and the shore within them low and sandy. The east-side or end is, most probably, like the south; as the shore begins to assume a rocky appearance, towards the N. E. point, though not above seven or eight feet high. This island may, with great propriety, be called a low one, as the trees, on the west part, where we now lay at anchor, only appeared; and the eminent part, that can be seen from a ship, is the S. E. point; though many gently rising and declining grounds are observable by one who is ashore. The general appearance of the country does not afford that beautiful kind of landscape that is produced from a variety of hills and valleys, lawns, rivulets, and cascades; but, at the same time, it conveys to a spectator an idea of the most exuberant fertility, whether we attend to the places improved by art, or those still in a natural state; both which yield all their vegetable productions with the greatest vigour, and perpetual verdure. At a distance, the surface seems entirely clothed with trees of various sizes; some of which are very large; but the tall cocoa-palms raise their tufted heads high above the rest, and are a noble ornament to any country that produces them. The boogo, a species of the fig, with narrow pointed leaves, is the largest sized tree upon the island; and the most common bushes, and small trees, especially toward the sea, are the pandanus, the faitanoo, several sorts of the hibiscus, and a few others. A coral rock appears to be the basis of the island, which is the only kind of soil that presents itself on the shore: nor did we see the least appearance of any other stone, except a few small blue pebbles strewed about the Fiatookas; and a smooth solid black stone, something like the lapis lydius, of which the natives make their hatchets: but these last may, probably, have been brought from other islands in the neighbourhood; for a piece of slaty iron-coloured stone was bought at one of them, which was never seen here. Though, in many places, the coral projects above the surface, the soil is, in most parts, of a considerable depth. In those that are uncultivated, it is, commonly, of a loose black colour; produced, seemingly, from rotten vegetables: underneath which may be a clayey stratum; for a soil of that kind is often seen both in the low, and in the rising grounds; but especially in several places toward the shore, where it is of any height; and when broken off, appears sometimes of a reddish, though oftener of a brownish yellow colour, and of a pretty stiff consistence. Where the shore is low, the soil is commonly sandy, or rather composed of coral dust; which however yields bushes growing with great luxuriance; and is sometimes planted, not unsuccessfully, by the natives. The climate of Tongataboo, from the situation towards

the tropic, is more variable, than in countries nearer to the line, though, perhaps, that might be owing to the season of the year, which was now the winter solstice. The winds are, for the most part, from some point between S. and E. and, when moderate, are commonly attended with fine weather. When they blow fresher, the weather is often cloudy, though open; and in such cases, there is frequently rain. The wind sometimes veers to the N. E. N. N. E. or even N. N. W. but never lasts long, nor blows strong from thence; though it is commonly accompanied by heavy rain, and close sultry weather. The quick succession of vegetables has been already mentioned; but it is not certain that the changes of weather, by which it is brought about, are considerable enough to make them perceptible to the natives as to their method of life, or rather that they should be very sensible of the different seasons. This, perhaps, may be inferred from the state of their vegetable productions, which are never so much affected, with respect to the foliage, as to shed that all at once; for every leaf is succeeded by another, as fast as it falls; which causes that appearance of universal and continual spring found here.

The principal of the cultivated fruits are plantains, of which they have 15 different sorts; bread-fruit, two kinds of fruit found at Oraheite, and known there under the names of jambu and cevec; the latter a kind of plumb; and vast numbers of shaddocks, which, however, are found as often in a natural state, as planted. The roots are yams, of which are two sorts; one black, and so large, that it often weighs 20 or 30 pounds; the other white and long, seldom weighing a pound. Here is a large root, called kappe; one, not unlike our white potatoes, called mawhaha; the talo, or cocos of other places; and another, named jecjee. Besides vast numbers of cocoa-nut trees, here are three other sorts of palms, two of which are very scarce. One of them is called beeco; which grows almost as high as the cocoa-tree, has very large leaves plaited like a fan, and clusters or bunches of globular nuts, not larger than a small pistol ball, growing amongst the branches, with a very hard kernel, which is sometimes eaten. The other is a kind of cabbage-tree, not distinguishable from the cocoa, but by being rather thicker, and by having its leaves more ragged. It has a cabbage three or four feet long; at the top of which are the leaves, and at the bottom the fruit, which is scarcely two inches long, resembling an oblong cocoa-nut, with an insipid tenacious kernel, called by the natives, neeoogoola, or red-cocoa-nut, as it assumes a reddish cast when ripe. The third sort is called ongo, and much commoner, being generally found planted about the Fiatookas. It seldom grows higher than five feet, though sometimes to eight; and has a vast number of oval compressed nuts, as large as a pippin, sticking immediately to the trunk, among the leaves, which are not eat. In this island is plenty of excellent sugar-cane, which is cultivated; gourds, bamboo, turmeric, and a species of fig, about the size of a small cherry, called matte, which though wild is sometimes eaten. The catalogue of uncultivated plants is too large to be enumerated. Besides the Pemphis, Decaspermum, Mallocoeca, Maha, and some other new genera, there are a few more that escaped

Dr. Foster's curious eye: but, perhaps, the different seasons of the year, and his short stay, did not give him an opportunity to notice them: in our longer stay here, not more than a fourth part of the trees and plants were in flower; a circumstance absolutely necessary, to enable one to distinguish the various kinds.

In this island are no other quadrupeds but hogs, some dogs, and a few rats. Fowls, which are of a large breed, are domesticated here. Of the birds are parrots, somewhat smaller than the common grey ones, having an indifferent green on the back and wings, the tail bluish, and the rest of a sooty or chocolate brown; parroquets, not larger than a sparrow, of a fine yellowish green, with bright azure on the crown of the head, and the throat and belly red; besides another sort as large as a dove, with a blue crown and thighs, the throat and under part of the head crimson, as also part of the belly, and the rest a beautiful green. Here are owls, about the size of our common ones, but of a much finer plumage; cuckoos mentioned at Palmerston's Isle; king-fishers, about the size of a thrush, of a greenish blue, with a white ring about the neck; and a bird of the thrush kind, almost as big, of a dull green colour, with two yellow wattles at the base of the bill, which is the only singing one we heard at this place; but it compensates a good deal for the want of other songsters, by the strength and melody of its notes, which fill the woods at dawn, in the evening, and at the breaking up of bad weather. The other land-birds are rails, as large as a pigeon, of a variegated grey colour, with a rusty neck; a black sort with red eyes, not larger than a lark; violet-coloured coots, with bald red crowns; two sorts of fly-catchers; a very small swallow; and three sorts of pigeons, one of which is the size of the common sort, of a light green on the back and wings, with a red forehead; and another, somewhat less, of a purple brown, but whitish underneath. Of water-fowl, and such as frequent the sea, are the ducks seen at Annamooka, though scarce here; blue and white herons; tropic birds; common noddies; white terns; a new species of a leaden colour, with a black crest; a small bluish curlew; and a large plover, spotted with yellow. Besides the large bats, mentioned before, there is also the common sort. The only noxious or disgusting animals of the reptile or insect tribe, are sea snakes, three feet long, with black and white circles alternately, often found on shore; some scorpions and centipedes. There are five green guanoes, a foot and a half long; another brown and spotted lizard, about a foot and a half long; and two other small sorts. Among the other sorts of insects, are some beautiful moths; butterflies; very large spiders; and others; making, in the whole, about fifty different kinds. Though the sea abounds with fish, the variety is less than might be expected. The most frequent sorts are the mullets; parrot fish; silver fish; old wives; beautiful spotted soles; leather jackets; bonnetos; and albicores; besides the eels mentioned at Palmerston's island; some sharks; rays; pipe fish; a sort of pikes; and some curious devil fish. The numerous reefs and shoals on the north side of the island, afford shelter for an endless variety of shell-fish; among which are many much esteemed in Europe; such as the true hammer oyster; of which, however, none could be obtained entire; a large indented oyster, and many others; but none of the common sort; panamas, cones; a gigantic cockle, found in the East Indies; pearl-shell oysters; and many others hitherto unknown to the most diligent enquirers after that branch of natural history. Here are likewise several sorts of sea-eggs; and many very fine star-fish; besides a considerable variety of corals; among which are two red sorts; the one most elegantly branched, the other tubulous. And there is no less variety among the crabs and cray-fish, which abound here.

On Monday, the 7th, early in the morning, a large canoe went along side the Discovery, in which were three men and a woman, of superior dignity to any her company had yet seen to come aboard. One of them, supposed by his venerable appearance, to be the high

priest, held a long pole or spear in his hand, to which he tied a white flag, and began an oration which lasted a considerable time. After it was concluded, he ascended the side of the ship, and sat down, with great composure, on the quarter deck, till he was accosted by captain Clerke, who, after the usual salutations, invited him, and his attendants, into the great cabin; but the latter declined the invitation; and to make known the dignity of the great personage, in whose presence they were, they prostrated themselves before him, the women as well as the men, and kissed the sole of his right foot. This aged islander brought with him, as a present to captain Clerke, four large hogs, six fowls, with a proportionable quantity of yams and plantains. In return, the Captain gave him a printed gown, a Chinese looking-glass, some earthen ware, &c. which he accepted with great courtesy, and with an air of dignity, which remarkably distinguished him. The Captain and officers paid him great attention, and shewed him the different accommodations on board the ship, at which he expressed great astonishment. He was then invited to eat, which he declined. He was offered wine, of which the Captain drank first; he put it to his lips, tasted it, but returned the glass. Having been on board little more than an hour, he was desirous of taking leave, and pointed to a little island, to which he gave the Captain a very pressing invitation to accompany him, but as he had other entertainments in view, on shore, that could not be complied with. This venerable person was about six feet, three inches high, finely proportioned, and had a commanding air, that was both affable and graceful. We were not favoured with a visit, nor did this great man come at any time on board the Resolution. Though we were now ready to sail, we had not sufficient day-light to turn through the narrows; the morning flood falling out too early, and the evening flood too late. We were therefore under a necessity of waiting two or three days, unless we should be fortunate enough to have a leading wind. This delay gave us an opportunity to be present at a public solemnity, to which the king had invited us, who said it would be performed in a day or two. Accordingly, he and all the people of consequence, repaired this day to Mooa, where the solemnity was to be exhibited.

On Tuesday the 8th, a party of us followed them. Poulaho now informed us, that his son was to be initiated into certain privileges; one of which was, that of eating with his father; an honour he had not hitherto enjoyed. About eight o'clock in the morning, we arrived at Mooa, where we found the king, with a number of attendants sitting before him, within a small dirty enclosure. They were, as usual, busied in preparing a bowl of kava. As this was not liquor for us, we went to pay a visit to some of our friends, and to observe what preparations were making for the ceremony, which was soon expected to begin. About ten o'clock, the people assembled in a large area before the malace, or great house. At the end of a road, opening into this area, stood several men with spears and clubs, reciting incessantly short sentences, in mournful accents, which conveyed an idea of distress. This was continued about an hour; during which time, many people came down the road, each having a yam tied to the middle of a pole, which they laid down before those who continued repeating the sentences. At length the king and prince arrived, and seated themselves upon the area; and we were requested to sit down by them, to take off our hats, and to untie our hair. The bears of the yams having all entered, each pole was taken up between two men, who carried it over their shoulders. They then formed themselves in companies, of ten or twelve each, and marched across the place, with a rapid pace, each company headed by a man who had a club or spear, and defended, on the right, by several others, armed with different weapons. About two hundred and fifty persons walked in the procession, which was closed by a man carrying on a perch a living pigeon. Omiah was desired by captain Cook to ask the chief where the yams were to be carried with so much solemnity; but he seemed unwilling to give us the information

The NATCHE, a CEREMONY in HONOUR of the KING'S SON, in TONGATABOO.

— PUBLISHED BY THE PROPRIETOR, AT THE "PUNCH" PRESS, —

mation we required: some of us, therefore, followed the procession, seemingly contrary to his inclination. They stopped before a Morai, or Featooka of one house, standing upon a mount, about a quarter of a mile from the place where they had first assembled. Here they deposited the yams, and gathered them into bundles; but for what purpose we could not possibly learn. Our presence seeming to give them uneasiness, we returned to Poulaho, who advised us to amuse ourselves by walking about, as nothing would be done for a considerable time. The fear of losing the sight of any part of the ceremony, prevented our being long absent. When we returned to the king, he desired captain Cook to order the boat's crew not to presume to stir from the boat, for every thing would, very soon, be taboo; and if any of our people, or of their own, should be seen walking about, they would certainly be knocked down with clubs, if they were not mated, that is, killed. He added, that we could not be present at the ceremony; but that we should be placed in such a situation, as to be able to see every thing that passed. Our dress was particularly objected to, and we were told, that, to qualify us to be present, we must be naked as low as the breast, that our hats must be off, and our hair untied. Omiah agreed readily to conform to these requisites, and immediately began to strip; but other objections were then started, and he was excluded equally with ourselves. Not relishing this restriction, the Captain stole out, to see what might now be going forward. Very few people, however, were to be seen, except those who were dressed to attend the ceremony; some of whom had in their hands small poles, about four feet in length, to the under part of which were fastened two or three other small sticks, about six inches long. These men were going towards the Morai. The Captain took the same road, and was frequently stopped by them, all crying out taboo. However, he ventured to go forward till he came in sight of the Morai, and of the people sitting before it. He was now strongly urged to go back, and, not knowing what might be the consequence of a refusal, he complied. He had observed, that those who carried the poles, passed the Morai; and guessing from this circumstance, that something was transacting beyond it, he had some thoughts of advancing, by making a round for this purpose; but he was so narrowly observed by three men, that he had no opportunity of carrying his design into execution. In order to shake off these three fellows, he returned to the Malace, where he had parted from the king, and afterwards made an elopement a second time; but he instantly met with the same men, who had doubtless received instructions to watch him. However, the Captain paid no attention to them, but proceeded onward till he came within sight of the king's principal Fiatooka, or Morai; before which a great number of people were sitting, being those whom he had just seen before pass by the morai, from whence this was but a little distant. Perceiving, while he was considering what he should do, that he could observe the proceedings of this company from the king's plantation, he repaired thither, accompanied by several of his people. The number of persons at the Fiatooka continued increasing for some time; and at length, they quitted their sitting posture, and marched off in procession. They walked in pairs, every pair carrying between them, one of the small poles on their shoulders. We were informed, that the small pieces of sticks, fastened to the poles, were yams; it is therefore probable, that they were meant to represent that root emblematically. The hindmost man of each couple placed one of his hands to the middle of the pole, as if it were not strong enough to carry the weight that hung upon it, and under which they all seemed to bend as they proceeded. This procession consisted of one hundred and eight pairs, chiefly men of rank. Having seen them all pass, we repaired to Poulaho's house, and saw him going out. We were not permitted to follow him; but were immediately conducted to the place allotted to us, behind a fence ad-

joining to the area of the Fiatooka, where the yams had been deposited in the morning.

When arrived at our station, we saw two or three hundred persons, sitting on the grass, near the end of the road opening into the area of the Morai; and others were continually joining them. At length, arrived a few men, each carrying some small poles and branches, or leaves of the cocoa-nut tree. As soon as they appeared, an old man seated himself in the road, and pronounced a long oration in a serious majestic tone. He then retired, and the others advancing to the middle of the area, began to erect a small shed or hut; employing, for that purpose, the materials already mentioned. Their work being finished, they all squatted down for a moment before it, then rose up, and joined the rest of the company. Poulaho's son arrived soon after, preceded by four or five male attendants. After them appeared about twelve or fourteen women of the first rank, advancing slowly in pairs, each pair carrying between them a narrow piece of white cloth, about two or three yards in length. They approached the prince, squatted down before him, and wrapped some of the pieces of cloth round his body; they then rose up, and retired in the same order, to some distance on his left, where they seated themselves. Poulaho now made his appearance, preceded by four men, walking two and two abreast, and sat down on his son's left hand, at a small distance from him. The young prince then quitted his first position, and seated himself under the shed, with his attendants; many others placing themselves on the grass before this royal canopy. The prince sat facing the people, with his back to the Morai. Three companies, of about ten or a dozen men in each, started up from among the crowd, soon after each other, and, running hastily to the opposite side, sat down for a few seconds; and then returned, in the same manner, to their former stations. To them succeeded two men, each having a small green branch in his hand, who rose and advanced towards the prince, sitting down for a few minutes, three different times, as they approached; and retired in the same manner, inclining their branches to each other as they sat. Afterwards two others repeated the same ceremony. The grand procession, which marched from the other Morai, now began to come in. As they entered the area, they proceeded to the right of the shed, and, having prostrated themselves on the grass, deposited their pretended heavy burdens, (the poles) and faced round to the prince. They then rose up, and retired in the same order, closing their hands with the most serious aspect, and seated themselves along the front of the area. While this numerous band were entering, and depositing their poles, three men, who sat with the prince, continued pronouncing separate sentences, in a mournful melancholy tone. A profound silence now ensued for a short time, after which a man who sat in the front of the area, began a kind of oration, during which, at several different times, he broke one of the poles which had been brought in. Having concluded his oration, the people sitting before the shed, separated, to make a lane, through which the prince and his attendants passed, and the assembly closed.

Satisfied with what we had already seen, some of our party now returned to the ships; but captain Cook, and some more of the officers, remained at Mooa, to see the conclusion of the solemnity, which was not to be till the day following. The small poles, which had been brought by those who walked in procession, being left on the ground, after the crowd had dispersed, the captain examined, and found that, to the middle of each, two or three small sticks were tied, as has been related. They were probably intended as only artificial representations of small yams. Our supper, consisting of fish and yams, was got ready about seven o'clock. The king supped with us, and drank so freely of brandy and water, that he retired to bed with a sufficient dose. We continued the whole night in the same house with him and his attendants. About one or two o'clock in the morning, on Wednesday, the 9th, they waked, con-

verbed

versed for about an hour, and then went to sleep again. All, except Poulaho, rose at break of day; soon after which, a woman, one of those who generally attended upon the king, came in, and sitting down by him, immediately began the same operation that had been practised upon Futafaihe, tapping, or beating gently, with her clenched fists, on his thighs: but this, instead of promoting repose, had the contrary effect, and he awoke. Captain Cook and Omiah paid now a visit to the prince, who had parted from us early in the preceding evening; for he did not lodge with the king, but in apartments of his own, at some distance from his father's house. We found him with a circle of youths, about his own age, sitting before him; also an old man and woman. There were others, of both sexes, employed about their necessary affairs, who probably belonged to his household. We now returned to the king, who had a crowded levee before him, consisting principally of old men. While a bowl of kava was preparing, a baked hog and yams, smoking hot, were introduced; the greatest part of which fell to our share; for these people, especially the kava drinkers, eat very little in the morning. We afterwards walked out, and visited several other chiefs, all of whom were taking their morning draught, or had already taken it. Returning to the king, we found him asleep in a retired hut, with two women patting him. About eleven o'clock he made his appearance among us, partook of some fish and yams, and again lay down to sleep. We now left him, and waited on the prince, with a present of cloth, beads and other articles. There was a sufficient quantity of cloth to make him a complete suit, and he was immediately clad in his new habiliments. Proud of his dress, he first went to exhibit himself to his father, and then conducted Captain Cook to his mother, with whom were about a dozen other women, of a very respectable appearance. Here the prince changed his apparel, and made the Captain a present of two pieces of cloth which had been manufactured in the island. It was now about noon, when, by appointment, the Captain repaired to the palace to dinner; which was soon after served up, and consisted of two pigs and some yams. The drowsy monarch was roused to partake of what he had ordered for our entertainment. Two mullets, and some shell-fish, were introduced, as if intended for his separate portion. But he added it to our fare, sat down with us, and made a hearty meal. Dinner being over, we were informed that the ceremony would soon begin, and were strictly enjoined not to venture out.

Captain Cook had resolved, however, to peep no longer from behind the curtain, but, if possible, to mix with the actors themselves. With this view he walked towards the Morai, the scene of the solemnity. He was desired frequently to return; but he paid no regard to the admonitions he had received, and was permitted to walk on. When arrived at the Morai, he saw a number of men seated on the side of the area. A few also were sitting on the opposite side, and two men in the middle, with their faces towards the Morai. When Captain Cook had got into the midst of the first company, he was desired to sit down, which he accordingly did. Where he sat, a number of small bundles were lying, composed of cocoa-nut leaves, and fastened to sticks made into the form of hand-barrows. All the information he could get concerning them was, that they were taboo. From time to time, one or another of the company turned to those who were coming to join us, and made a short speech, in which we remarked, that the word arekee (king) was generally mentioned. Something was said by one man that produced loud bursts of laughter from all around; others, of the speakers, were also much applauded. The Captain was frequently desired to leave the place; but, at length, finding him determined to stay, they requested him to uncover his shoulders, in like manner as they had done. This he readily complied with, and then they no longer seemed uneasy at his presence. The prince, the women, and the king, at length appeared, as they had done the preceding day. The prince being

placed under the shed, two men, each having a piece of mat, came, repeating something in a very serious strain, and put them about him. The people now began their performances, and different companies ran backward and forward across the area, as in the former day. Presently afterwards, the two men in the middle of the area, made a short speech, and then the whole company rose up, and placed themselves before the shed in which the prince, and three or four men were seated. One of the company, who seemed very desirous of obliging the Captain, procured him such a situation, that, if he could have made use of his eyes, nothing could have escaped him. But it was necessary to have a demure countenance and downcast looks. The procession now arrived, as on the day before; a pole, with a cocoa-nut leaf plaited round the middle of it, being carried on the shoulders of every two persons. These were deposited with the same ceremonies as on the day before. After this succeeded another procession, composed of men who brought baskets, made of palm-leaves, such as are generally used by these people to carry provisions in. A third procession followed, in which a variety of small fish, each placed at the end of a forked stick, were brought. An old man, who sat on the prince's right hand, without the shed, received the baskets, each of which he kept in his hand, making a short speech or prayer; then laying that aside, he called for another, repeating the same kind of prayer; he proceeded in this manner till he had gone through the whole number of baskets. Two men, who, till this time, had in their hands green branches, and were seated on the left, received the fish one by one, as they were presented to them on the forked sticks. The first fish they laid down on their right hand, and the second on their left. The third being presented, a stoutish man, who was seated behind the other two, endeavoured to seize it, as did also the other two at the same time. Thus every fish was contended for; but the man behind, on account of his disadvantageous situation, got only pieces; for he never quitted his hold till the fish was torn out of his hand. What the others got, were laid on the right and left. At last the person behind got possession of a whole fish, the other two not even touching it. Upon this, the word marecai (very good) was pronounced in a low voice throughout the whole crowd. It appeared, that he had now done all that was expected from him; for he did not contend for the other fish. The persons who brought in these baskets and fish, delivered them sitting; and in the same manner, the poles carried in the first procession, had been placed on the ground. At the close of the last procession, there was speaking sentiments and praying by different persons. Then on a signal being given, we all rose up, ran several paces, and sat down, with our backs to the prince. The Captain was bid not to look behind him; but he was not discouraged by this injunction from facing about. The prince had now turned his face to the Morai, and from that moment he was admitted to the honour of eating with his father; and a piece of roasted yam was presented to each of them for that purpose. Soon after we turned about, forming a kind of semicircle before the prince, and leaving an open space between us. Presently some men advanced towards us, two and two, bearing large poles upon their shoulders, waving their hands as they proceeded, and making a noise like singing. When near us, they made a show of walking quick, without advancing a single step, several men armed with large sticks, immediately started from the crowd, and ran towards the new visitors, but they instantly made off, having thrown down the poles from their shoulders. The others attacked the poles, and having beat them most furiously, returned to their places. The former, as they ran off, gave the challenge used here in wrestling; and, in a short time, some lusty fellows came from the same quarter, repeating the challenge as they approached. These were resisted by a company, who arrived at that instant from the opposite side. Both parties, however, returned to their own quarter, after having paraded about the area for some minutes. Afterwards, for the space of half an hour, wrestling

POULAHU, KING of the FRIENDLY ISLANDS, drinking KAVA.

COLLEGE AND UNIVERSITY LIBRARY

wrestling and boxing matches succeeded. Speeches were then delivered by two men, who seated themselves before the prince, with which the solemnity ended, and the whole assembly broke up.

In vain did he endeavour to find out the purport of this solemnity, called by the natives *natche*. All the answer we received to our enquiries, was *taboo*, which, as has been already observed, is applied to many things. There was a solemn mystery in the whole transaction; and from the manner of performing it, as well as the place where it was performed, it was evident there is a mixture of religion in the institution. Upon no other occasion had they regarded our dress and deportment; but now it was required, that our hair should flow about our shoulders; that we should be uncovered to the waist; sit cross legged; and have our hands locked together. It should be observed also, that none but the principal people, and those who were concerned in the ceremonies, were admitted to assist in the celebration of the solemnity. All these circumstances pointed out evidently, that they supposed themselves acting under the inspection of a supreme being upon this occasion. From this account of the *natche*, it may be considered as merely figurative. The few yams that were seen the first day, could not be meant as a general contribution; and it was intimated to us, that they were a portion consecrated to the *Otooa*, or Divinity. We were informed that, in the space of three months, there would be represented a more important solemnity; on which occasion the tribute of *Tongataboo*, *Hapae*, *Vivao*, and all the other islands, would be brought to the chief, and more awfully confirmed, by sacrificing ten human victims from among the people. A horrid solemnity indeed! On our inquiring into the occasion of so barbarous a custom, we were informed that it was a necessary part of the *natche*; and that if omitted, the Deity would destroy their king. The day was far spent before the breaking up of the assembly; and as we were at some distance from the ships, we were impatient to set out from *Mooa*. Taking leave of *Poulaho*, he pressed us earnestly to stay till the next day, in order to be present at a funeral ceremony. The wife of *Mareewagee*, his mother-in-law, had lately died; and, on account of the *natche*, her corps had been carried on board a canoe in the lagoon. He said, that when he had paid the last offices to her, he would attend us to *Eooa*; but if we did not chuse to wait, he would follow us thither. We would gladly have been present at this ceremony, had not the tide been now favourable. The wind too, which had been very boisterous, was now moderate and settled. Besides, we were told, that the funeral ceremonies would continue five days, which, as the ships lay in such a situation that we could not put to sea at pleasure, was too long a time to stay. The Captain, however, assured the king, that if he did not immediately sail, he would visit him again the next day. While we were attending the *natche*, at *Mooa*, the Captain ordered the horses, bull, and other cattle, to be brought thither, thinking they would be safer there, than at a place that would be, in a great measure, deserted, the moment after our departure. Besides, we had left with our friends here, a young English boar, and three young English sows. They were exceedingly desirous of them, naturally supposing they would greatly improve their own breed, which are but small. *Feenou* also got two rabbits from us, a buck and a doe, from which young ones were produced before we sailed. Should the cattle prosper, the acquisition to these islands will be great; and as *Tongataboo* is a fine level country, the horses will be extremely useful. We now all, the evening being far advanced, took leave of the king, and arrived at our ships about eight o'clock.

On Thursday, the 10th, we weighed, about eight o'clock A. M. and with a steady gale at S. E. turned through the channel, between the small isles, called *Makkahaa*, and *Monooafai*, it being much wider than the channel between the last mentioned island and *Pangimodoo*. The flood, at first set strong in our fa-

vour, till we were the length of the channel leading up to the lagoon, where the eastward flood meets that from the west. This, with the indraught of the lagoon, and of the shoals before it, occasions strong ripplings and whirlpools. Besides these disadvantages, the depth of the channel exceeds the length of a cable; consequently there can be no anchorage, except close to the rocks; in forty and forty-five fathoms water, where a ship would be exposed to the whirlpools. The Captain, therefore, abandoned the design he had formed of coming to an anchor, when we were through the narrows; and afterwards of making an excursion to see the funeral. He rather chose to be absent from that ceremony, than to leave the ships in so dangerous a situation. We plied to windward, between the two tides, till it was near high water, without either gaining or losing an inch, when we suddenly got into the influence of the eastern tide, where we expected the ebb to run strongly in our favour. It proved, however, very inconsiderable: at any other time it would not have been noticed: but by this circumstance we were led to conclude, that most of the water, which flows into the lagoon, comes from the N. W. and returns the same way. Convinced that we could not get to sea before it was dark, we cast anchor under the shore of *Tongataboo*, in 45 fathoms water. The *Discovery* dropped her anchor under our stern; but drove off the bank before the anchor took hold, and did not recover it till near midnight. On Friday, the 11th, near noon, we weighed and plied to the eastward. At ten o'clock P. M. we weathered the east end of the island, and stretched away for *Middleburgh*, which the inhabitants call *Eooa*, or *Ea-oowhe*. We anchored about eight o'clock A. M. of the 12th, on the S. W. side of the island, in 40 fathoms water, over a bottom of sand, interspersed with coral rocks; the extremes of the island extending from N. 40 deg. E. to S. 22 deg. W. the high land of *Eooa*, S. 45 deg. E. and *Tongataboo*, from N. 70 deg. W. to N. 19 deg. W. distant about half a mile from the shore; being nearly the same place where Captain Cook took his station in 1773, and which he named *English Road*. We had no sooner anchored, than the natives came on board with as little ceremony, as if they had been acquainted with us for many years. They brought us the produce of the island: but being already supplied with every necessary of that kind, our chief traffic was for birds and feathers. Here the parrots and paroquets were of the most beautiful plumage, far surpassing those usually imported into Europe from the Indies; there are a great variety of other birds, on which many gentlemen in both ships put a great value, though they were purchased for trifles. The feathers we procured, were of divers colours, for different markets, but chiefly for the *Marquesas* and *Society Isles*. We also purchased cloth, and many other articles of curious workmanship, the artists of this island, for invention and ingenuity in the execution, exceeding those of all the other islands in the South Seas: but what particularly invited our stay here, was the richness of the grass, which, made into hay, proved excellent food for our live stock. Among others, *Taooa* the chief, visited us on board, and seemed to rejoice much at our arrival. This person had been Captain Cook's *Tayo*, in 1773, and, therefore, they were not strangers to each other. The Captain accompanied him ashore in search of fresh water, the procuring of which was the main object which brought us to *Middleburgh*. We had heard at *Amsterdam* of a stream at this island, which, it was said, runs from the hills into the sea: but this was not to be found. The Captain was conducted to a brackish spring, among rocks, between low and high-water mark. When they perceived, that we did not approve of this, we were shewn a little way into the island; where, in a deep chasm, we found some excellent water; which, at the expence of some time and trouble, might be conveyed to the shore, by means of spouts and troughs, provided for that purpose: but rather than undertake so tedious a task, we rested contented with the supply the ships had received at *Tongataboo*. At this island of *Eooa* we landed the ram

and two ewes, of the Cape of Good Hope breed, and committed them to the care of Taofa, who seemed proud of his charge. It was, perhaps, a fortunate circumstance, that Mareewagee, for whom they were intended, had slighted the present; for as Eooa had no dogs upon it, at present, it seemed to be a fitter place for feeding sheep than Tongataboo. While we lay at anchor, the island of Eooa, or Middleburgh, had a very different aspect from any one that we had lately seen, and formed a most beautiful landscape. It is the highest of any we had seen since we had left New Zealand, and from its summit, which appears to be almost flat, declines gradually towards the sea. The other isles, which form this cluster, being level, the eye cannot discover any thing except the trees that cover them: but here the land, rising gently upwards, presents an extensive prospect, where groves, in beautiful disorder, are interperfed at irregular distances. Near the shore, it is quite shaded with a variety of trees, among which are placed the habitations of the natives, and to the right of our station was one of the most extensive groves of cocoa-palms that we had ever seen.

Sunday the 13th, a party of us, in the afternoon, ascended to the highest part of the island, a little to the right of our ships, to have a perfect view of the country. Having advanced about half way up, we crossed a deep valley, the bottom and sides of which were covered with trees. We found plenty of coral till we approached the summits of the highest hills: the soil near the top, is in general, a reddish clay, which in many places is very deep. On the most elevated part of the island, we saw a round platform, supported by a wall of coral stones. Our guides informed us, that this mount had been erected by command of their chief, and the principal people sometimes resorted there to drink kava. They called it Etchee, by which name an erection was distinguished which we had seen at Tongataboo. At a small distance from it was a spring of most excellent water; and, about a mile lower down, a stream, which, we were told, ran into the sea, when the rains are copious. We also discovered water in several small holes, and suppose that plenty might be found by digging. From this elevation we had a complete view of the whole island, except a small part to the south. The S. E. side, from which the hills we were now upon are not far distant, rises with great inequalities, immediately from the sea; so that the plains and meadows lie all on the N. W. side; which being adorned with tufts of trees, intermixed with plantations, form a most delightful landscape in every point of view. While the captain was surveying this enchanting prospect, he enjoyed the pleasing idea, that some future navigators might, from the same eminence, behold those meadows stocked with cattle, brought by the ships of England; and that the completion of this single benevolent purpose, exclusive of all other considerations, would sufficiently prove, that our voyages had not been useless. We found on this height, besides the plants common on the neighbouring isles, a species of acrosticum, melastoma, and fern trees. All, or most of the land on this island, we were told, belonged to the chiefs of Tongataboo; the inhabitants being only tenants, or vassals to them. This seemed, indeed, to be the case at all the neighbouring isles, except Annamooka, where some of the chiefs seemed to act with a degree of independence. Omiah, who was much esteemed by Feenou, and many others, was tempted with the offer of being appointed a chief of this island, if he would continue among them; and he seemed inclinable to have accepted the offer, had he not been advised to the contrary by Captain Cook; though not because he thought he would do better for himself in his native isle. Returning from our country excursion, we heard that a party of the natives, in the quarter where our people traded, had struck one of their countrymen with a club, which fractured his skull, and afterwards broke his thigh with the same. Not any signs of life were remaining, when he was carried to a neighbouring house, but, in a short time he recovered a little. On our desiring to know

the reason of such an act of severity, we were informed, that the offender had been discovered in an indelicate situation with a woman who was taboo'd. We soon understood, however, that she was no otherwise taboo'd, than by belonging to another, superior in rank to her gallant. From this incident, we discovered how these people punish such infidelities: but the female sinner has a much milder correction for her crime, receiving only a slight remonstrance, and a very gentle beating.

On Monday the 14th, in the morning, we planted a pine-apple, some seeds of melons, and other vegetables, in a plantation belonging to the chief. We had good reason, indeed, to suppose, our endeavours of this kind would not be fruitless; for a dish of turnips was, this day, served up at his table, which was the produce of the seeds that were left here in 1773. The next day being fixed upon by the captain for sailing, Taofa pressed us to stay a little longer. We must here observe, that in the account of Captain Cook's former voyage, he calls the only chief he met with at this place Tiouy; but we are inclined to think, from the information of a gentleman of veracity, on board the Discovery, at this time, that Tiouy and Taofa are one and the same person. His intreaties, together with the daily expectation of receiving a visit from some of our friends at Tongataboo, induced us to defer our departure. On Tuesday the 15th, we received from Taofa a present consisting of two little heaps of yams, and a quantity of fruit, which seemed to have been collected as at the other isles. On this occasion the greatest part of the inhabitants of the island had assembled; and, as we had many times experienced, on such numerous meetings among their neighbouring islanders, gave us no small trouble to prevent their pilfering. Cudgelling, wrestling, and boxing, were exhibited for our entertainment; and in the latter exercises, combatants of both sexes engaged. These diversions were to be finished with the bomai, or night dance, but the following accident prevented our staying on shore to see it. From the accounts circulated through the ships when we arrived, it was generally believed, that we might travel through this island with our pockets open, provided they were not lined with iron; but to this, the behaviour of a party of the inhabitants to William Collet, captain's steward of the Discovery, is an exception. Being alone, diverging himself in surveying the country, he was set upon and stripped of every thing, his shoes only excepted, and on preferring his complaint, his keys were all that he was able to recover. When Captain Cook heard of this robbery, he seized two canoes, and a large hog; at the same time insisting on the chief's not only causing the apparel to be restored, but also on the offenders being delivered up to him. Taofa seemed greatly concerned at what had happened, and took the necessary steps to satisfy us. The people who had as usual assembled together, were so alarmed at this affair, that most of them immediately fled. However, when they were informed, that the captain meant to take no other measures to revenge the insult, they returned. One of the delinquents was soon delivered up, and a shirt, and pair of trousers restored. The remainder of the stolen things not coming in till the evening, the captain was obliged to leave them, in order to go aboard; the sea running so high, that it was extremely difficult for the boats to get out of the creek even with day light, and would be attended with much more danger in the dark. He returned on shore again the next morning, taking with him a present for Taofa, in return for what he had received from him. Being early, there were but few people at the landing-place, and even those few not without their fears and apprehensions; but on the captain's desiring Omiah to assure them, that we did not mean to injure them, and having restored the canoes, and released the offender, who had been delivered up, they resumed their usual cheerfulness, and a large circle was presently formed, in which the chief and the principal men of the island took their respective places. At length the remainder of the cloaths

were brought in, but having been torn off the man's back by pieces, they were not thought worth carrying on board. Taoofoa shared the present he had received, with three or four other chiefs, reserving only a small part for himself. This donation so far exceeded their expectation, that a venerable old man told the captain, they were not deserving of it, considering how little he had received from them, and the ill treatment Mr. Collet had met with. Captain Cook continued with them, till they had emptied their bowl of kava; and then, after paying for the hog, which he had taken the day before, returned on board, in company with Taoofoa, and one of Poulaho's servants, by whom he sent a piece of bar-iron, as a parting mark of esteem for that chief. This was as valuable a present as any the captain could make. Orders had been given the preceding day for sailing, and Otaheite was appointed our place of rendezvous, in case of separation. We had now been more than two months improving our live stock, wooding, watering, repairing our ships, and laying in fresh provisions from these Friendly Islands. The crews of both ships received these orders with alacrity; for though they wanted for nothing, yet they longed to be at Otaheite, where some of them had formed connections that were dear to them, and where those, who had not yet been there, had conceived so high an idea of its superiority, as to make them look upon every other place they touched at as an uncultivated garden, in comparison with that little Eden.

We were therefore all in high spirits this morning; for soon after the captain had sent off his present by Poulaho's servant, we weighed, and with a light breeze stood out to sea, when Taoofoa and other natives, who were in the ship, left us. We found, on heaving up the anchor, that the cable had been much wounded by the rocks; b-fides which we experienced, that a prodigious swell rolls in there from the S. W. so that the bottom of this road is not to be depended on in all weathers. We now steered our course to the southward, to fetch a wind to carry us to our intended port; and we observed a sailing canoe entering the creek before which we had anchored our ships. A few hours after, a small canoe, conducted by four men, came off to us; for having but little wind, we were still at no considerable distance from the land. We were informed by these men, that the sailing canoe, which we had seen arrive, had brought directions to the people of Eooa, to furnish us with hogs, and that the king and other chiefs would be with us in the space of three or four days. They therefore requested, that we would return to our former station. We had no reason to doubt the truth of this information; but being clear of the land, it was not a sufficient inducement to bring us back; especially, as we had already a sufficient stock of fresh provisions to last us in our passage to Otaheite. Besides Taoofoa's present, we received a large quantity of yams, &c. at Eooa, in exchange for nails; and added considerably to our supply of hogs. Finding we were determined not to return, these people left us in the evening, as did some others, who had come off in two canoes, with cocoa-nuts and shaddock, to barter for what they could get; their eagerness to possess more of our commodities, inducing them to follow us to sea, and to continue their intercourse with us to the last moment.

As we have now taken leave of the Friendly Islands, a few observations we made respecting these, and others in their neighbourhood, may not be unworthy the notice of our readers. During a cordial intercourse of between two and three months with their inhabitants, it may be reasonably supposed differences must arise; some, indeed, occasionally happened, on account of their natural propensity to thieving, though too frequently encouraged by the negligence and inattention of our people on duty. These little misunderstandings and differences were never attended with any fatal consequences, and few, belonging to our ships, parted from their friends without regret. The time we continued here was not thrown away; and as, in a great

measure, our subsistence was drawn from the produce of the islands, we expended very little of our sea provisions; and we carried with us a sufficient quantity of refreshments, to supply us till our arrival at another station, where we could again recruit: nor was it less pleasing to us, that we had an opportunity of serving these friendly people, by leaving some useful animals among them; and that those intended for Otaheite, had acquired fresh strength in the pastures of Tongataboo. The advantages we received, by touching here, were great, and we obtained them without retarding the prosecution of our grand object; the season for proceeding to the north being lost, before we formed the resolution of visiting these islands. "But," observes Captain Cook, "besides the immediate advantages, which both the natives of the Friendly Isles, and ourselves received by this visit, future navigators from Europe, if any such should ever tread our steps, will profit by the knowledge I acquired of the geography of this part of the Pacific Ocean; and the more philosophical reader, who loves to view human nature in new situations, and to speculate on singular, but faithful representations of the persons, the customs, the arts, the religion, the government, and the language of uncultivated nature and man, in remote and fresh discovered quarters of the globe, will, perhaps, find matter of amusement, if not of instruction, in the information which I have been enabled to convey to him, concerning the inhabitants of this Archipelago." We now proceed with our proposed observations.

The best articles for traffic in these islands are iron and iron tools. Axes, hatchets, nails of all sizes, knives, rasps, and files, are much demanded. Red cloth, white and coloured linen, looking glasses and beads, are also in great estimation; but of the latter, those that are blue the natives prefer to most others, particularly to the white ones. A hog might, at any time, be purchased, by a string of large blue beads: it should, nevertheless, be observed farther, that articles, merely ornamental, may be highly esteemed at one time, and disregarded at another. On our first arrival at Annamooka, the inhabitants were unwilling to take them in exchange for fruit; but when Feenou arrived, his approbation brought them into vogue, and stamped on them the value above-mentioned. In return for these commodities, all the refreshments to be had at the Friendly Islands, may be procured. The yams are excellent, and, when grown to perfection, preserve well at sea: but their pork, plantains and bread-fruit, are inferior in quality to the same articles at Otaheite. The productions and supplies of these islands are yams, bread-fruit, plantains, cocoa-nuts, sugar-canes, hogs, fowls, fish, and, in general, all such as are to be met with at Otaheite, or any of the Society Islands. But good water, which ships in long voyages stand much in need of, is scarce at the Friendly Isles. It may, it is true, be found in all of them, but not to serve the purposes of navigators; for either the quality is bad, or the situations too inconvenient, or the qualities too inconsiderable. While we lay at anchor under Kotoo, we were informed, that there was a stream of water at Kao, which ran from the mountains into the sea, on the S. W. side of the island. This intelligence, though of no use to us, may deserve the attention of future navigators.

We must include, under the denomination of the Friendly Islands, not only the group at Hapae, but likewise those that have been discovered to the north nearly under the same meridian, as well as some others under the dominion of Tongataboo or Amsterdam, which is the capital, and seat of government. From the best information we could obtain, this cluster of islands is very extensive. One of the natives enumerated 150 islands; and Mr. Anderson procured the names of all of them; from their communications the following list was made. They were enumerated by the inhabitants of Annamooka, Hapae, and Tongataboo; and may serve as a ground-work for the investigation of future navigators.

A LIST of those FRIENDLY ISLANDS, represented by the Natives as Large Ones.

Vavao	Kovoocca	Koogooloo
Goofoo	Kopao	Konnagillelaivoo
Talava	Takounove	Kofoona
Toggelao	Oloo	Kolaiva
Lotooma	Loubatta	Komoarra
Vytooboo	Pappataia	Komotte
Potoona	Lefhainga	Kotooboo
Necootabootaboo	Manooka	Kongairahoi
Hamao	Tootoocla	Oowaia
Tafcedoowaia	Havacecke	Feejee
Kongaireckee		Neuafu

A LIST of the Smaller FRIENDLY ISLES.

Eatte	Mafanna	Gowakka
Boloa	Kollooa	Vagaetoo
Tattahoi	Tabanna	Golabbe
Toofagga	Motooha	Novababoo
Fonoalaiee	Looakabba	Kokabba
Loogobahanga	Looamoggo	Kottejeea
Foamotoo	Moggodoo	Kowougoheefo
Taola	Konneva	Geenageena
Wegaffa	Konnevy	Koonooogoo
Foonoonne	Toonabai	Koonookoonama
Fonoaonia	Gonoogoolaiee	Koweeka
Manenecta	Mallalahee	Failemaia
Koloa	Mallajee	Koreemou
Toofanaclaa	Matagefaia	Noogooaccou
Toofanaetollo	Kolokolahoe	Fonoaeecka
Fafeene	Kologobeele	Koooa
Taoonga	Kotoolooa	Modooanoogoo- noogoo
Kobakeemotoo	Komongoraffa	Fonogooeatta
Komalla	Konnetalle	Koverettoa
Kongahoonoho	Konoababoo	Felongoabonga
Tongooa	Komooefeva	Kollalona

Of the size of the above 32 unexplored islands, we can only give it as our opinion, that they must be all larger than Annamooka, (or Rotterdam) which those from whom we had our information, ranked among the smaller islands in the second list. Some, or indeed, several of the latter are mere spots, without inhabitants. But it must be left to future navigators, to introduce into the charts of this part of the great southern Pacific Ocean, the exact situation and size of near 100 more islands in this neighbourhood, according to the testimony of our friends, which we had not an opportunity to explore. Tasman saw eighteen or twenty of these small islands, every one of which was encircled with sands, shoals and rocks. In some charts they are called Heemskirk's Banks. We have not the least doubt, that Prince William's islands, discovered, and so named by Tasman, are included in the fore-going list: for while we lay at Hapae, one of the natives told us, that three or four days sail from thence to the N. W. there is a cluster of islands, consisting of more than forty; and this situation corresponds very well with that assigned, in the accounts of Tasman's voyage, to his Prince William's Islands. Keppel's and Boscawen's Isles, discovered by Captain Wallis in 1765, are doubtless comprehended in our list; and they are not only well known to these people, but are under the same sovereign. We have good authority to believe, that Boscawen's Island is our Kootahee, and Keppel's Island our Necootabootaboo. The last is one of the large islands marked in our first list. The reader, who has been already apprized of the variations of our people in writing down what the natives pronounced, will hardly doubt that Kottejeea, in our second list, and Kootahee, as one of the natives called Kao, are one and the same island. We would just remark once more of this astonishing group of islands, that fifteen of them are said to be high and hilly, such as Toofoa, and Eooa; and thirty-five of them large. Of these only three were seen this voyage, namely, Hapae (considered by the natives as one island) Tongataboo, and Eooa. Annamooka has been

noticed before. But the most considerable islands that we heard of in this neighbourhood, are Hamao, Vavao, and Feejee; each of which is larger than Tongataboo; but it does not appear that any European has ever yet seen one of them. Hamao lies two days sail N. W. from Vavao. It is said to be the largest of all their islands; affords harbours, with good water, and produces, in abundance, all the refreshments that are found at the places we visited. Poulaho frequently resides upon this island; and its natives are in high estimation at Tongataboo. According to the united testimony of all our friends at this place, Vavao exceeds the size of their own island, and has high mountains. We should have accompanied Feenou from Hapae to Vavao, had he not discouraged the Captain, by representing it to be very inconsiderable, and without a single good harbour: but Poulaho, the king, gave us to understand afterward, that it is a large island, and not only produces every thing in common with Tongataboo, but has the peculiar advantage of possessing several streams of fresh water, and also an excellent harbour. Poulaho offered to attend the Captain to Vavao, saying, that if he did not find every thing agreeing with his representation, he might kill him. We gave full credit to the truth of his intelligence, and were satisfied that Feenou, from some private view, endeavoured to impose upon us a fiction.

Feejee lies in the direction of N. W. by W. about three days sail from Tongataboo. The natives in this part of the world have no other method of discovering the distance from island to island, but by mentioning the time required for the voyage in one of their canoes. In order to ascertain this with some precision, Captain Cook failed in one of their canoes, and by repeated trials with the log, found that she went close hauled, in a gentle gale, seven miles an hour. He supposed from this experiment, that they would sail, with such breezes as generally blow on their seas, seven or eight miles an hour on an average. Each day, however, is not to be reckoned at 24 hours; for when they talk of one day's sail, they mean no more than from morning to the evening, or twelve hours at most. From the morning of the first day till the evening of the second, is, with them, two days sail. In the day, they are guided by the sun; and, in the night by the stars. When these are obscured, they can only have recourse to the points from whence the winds and waves came upon the vessel. If, at that time, the winds and the waves should shift, they are quite bewildered, often missing their intended port, and being never heard of more. The story of Omiah's countrymen, who were driven to Watceoo, convinces us, however, that those who are not heard of, are not always lost. Feejee abounds with hogs, dogs, and fowls, and such fruits and roots as are to be found in any of the other islands, and is much larger than Tongataboo, but not subject to its dominion. Feejee and Tongataboo engage in war against each other; and the inhabitants of the latter are often so much afraid of this enemy, that they bend the body forward, and cover the face with their hands, to express the sense of their own inferiority to the Feejee men. This, indeed, is no matter of surprise, for those of Feejee have rendered themselves formidable, by their dexterity in the use of bows and slings; but more so, by their savage practice of eating such of their enemies as they kill in battle. It has been insisted on, that extreme hunger first occasioned men to feed on human flesh; but where could be the inducement for the Feejee men to continue the practice, and remain cannibals, in the midst of plenty? It is held in detestation by the inhabitants of Tongataboo, who seem to cultivate the friendship of their savage neighbours through fear; though they sometimes venture to skirmish with them on their own ground, and carry off large quantities of red feathers as trophies. When a profound peace reigns between them, they have frequent intercourse together; though, it is probable, they have not long been known to each other, otherwise it might be supposed that Tongataboo, and its neighbouring islands, would, before this time, have been supplied with a breed

of dogs, which are numerous at Feejee, and, as we have observed, were introduced at Tongataboo, when Captain Cook first visited it in 1773. The colour of the natives of Feejee is, at least, a shade darker than that of the inhabitants of the other Friendly Islands. We saw one of the natives of Feejee, who had his ear slit, which was the left, and the lobe so stretched, that it almost extended to his shoulder; which singularity had been observed by Captain Cook, at other islands of the South Sea, during his second voyage. The Feejee people are much revered here, not only on account of their power and cruelty in war, but also for their ingenuity; for they much excel the inhabitants of Tongataboo in workmanship. Specimens were shewn us of their clubs and spears, which were very ingeniously carved. We were also shewn some of their cloth most beautifully chequered, mats richly variegated, curious earthen pots, and other articles, all of which displayed a superiority in the execution.

The harbour and anchoring places are by far preferable to any we discovered among these islands; both on account of their capacity, and great security. The danger we were in of being wrecked, by entering it from the north, will remain a caution to every future commander, not to attempt that passage with a ship of burden. The eastern channel is much more easy and safe. To sail into this, steer for the N. E. point of the island, and keep along the north shore, with the small isles on your starboard, till you are the length of the east point of the entrance into the lagoon; then edge over the reef of the small isles, and, following its direction, you will get through between Makkahaa and Monooafai, which lay off the west point of the lagoon. Or you may go between the third and fourth islands, that is, between Pangimodoo and Monooafai; but this channel is much narrower than the other. When you are through either of these channels, haul in for the shore of Tongataboo, and cast anchor between that and Pangimodoo, before a creek leading into the lagoon; into which, at half flood, you may go with boats. Though the harbour of Tongataboo has the preference, its water is exceeded in goodness by that of Annamooka; and yet even this can scarcely be called good. Indifferent water may, nevertheless, be procured, by digging holes near the side of the pond. Besides, Annamooka, being nearly in the center of the whole group, is best situated for procuring refreshments from the others. There is a creek in the reef on the north side of the island, wherein two or three ships may lie securely.

We have already given an account of the Hapae islands; and shall only add, that they extend S. W. by S. and N. E. by N. about 19 miles. The north end lies in latitude 19 deg. S. and 33 deg. of longitude to the east of Annamooka. Between them are small islands, sand banks, and breakers. Lafooga, off which we anchored, among all the isles of those that are called Hapae, is the most fertile, and the best inhabited. Those who may be desirous of having a more particular description of the Friendly Islands, must have recourse to the list and chart. What may have here been omitted concerning their geography, will be found in our history of Captain Cook's former voyage, to which our readers are referred for such particulars as he had then observed. At present, we shall only relate such interesting circumstances, as either were omitted in that account, or were imperfectly and incorrectly represented.

After living among the natives of the Friendly Islands between two and three months, it is reasonable to expect, that we should be able to clear up every difficulty, and to give a satisfactory account of their manners, customs, and institutions, civil as well as religious: especially, as we had a person with us, who, by understanding their language as well as our own, might be thought capable of acting as our interpreter. But Omiah was not qualified for that task. Unless we had before us an object or thing, concerning which we wanted information, we found it difficult to obtain a competent knowledge about it, from his information

and explanations. Omiah was certainly more liable to make mistakes than we were; for having no curiosity, he never troubled himself with making remarks; and when he attempted to explain any particular matters to us, his ideas were so limited, and differed so much from ours, that his confused accounts, instead of instructing, often only perplexed, and led us into numberless mistakes. Besides, we could seldom find a person, among the natives, who had both the ability and inclination to give us the information we required: and many of them, we perceived, appeared offended at being asked, what they, perhaps, deemed frivolous questions. At Tongataboo, where we continued the longest, our situation was likewise unfavourable; being in a part of the country, where, except fishers, there were few inhabitants. With our visitors, as well as with those we visited, it was always holiday; so that we could not observe, what was really the domestic way of living among the natives. That we could not, therefore, thus circumstanced, bring away satisfactory accounts of many things, is not to be wondered at. Some of us, indeed, endeavoured to remedy those disadvantages; and to the ingenious Mr. Anderson we are most indebted for a considerable share of our observations respecting the Friendly Islands.

The inhabitants of these, (though some here, at Tongataboo, were above six feet high) exceed the common stature, and are strong and well proportioned. Their shoulders are, in general, broad; we saw several who were really handsome; though their muscular disposition rather conveyed the idea of strength than of beauty. Their features are so various, that, unless it be by a fulness at the point of the nose, which is common, it is impossible to fix any general likeness by which to characterize them. On the other hand many genuine Roman noses, and true European faces, were seen among them. They have good eyes and teeth; but the latter are neither so well set, nor so remarkably white, as among the Indian nations. Few of them, however, have that remarkable thickness about the lips, so frequent in other islands. The women are less distinguished from the men by their features, than by their general form, which seems destitute of that strong firmness that appears in the latter. Though the features of some are very delicate, and a true index of their sex, laying claim to a considerable share of beauty and expression, yet the rule is not, by any means, so general, as in many other countries. Their shapes are usually well proportioned; and some are absolutely perfect models of a beautiful figure; but the extraordinary smallness and delicacy of their fingers, which may be put in competition with any in Europe, seems to be the most striking female distinction. The general colour of these people is a cast deeper than that of the copper brown; but several of both sexes have a true olive complexion. Some of the women are much lighter, owing, perhaps, to their being less exposed to the sun. As a tendency to corpulence, in some of the principal people, seems to be the effect of a more indolent life, a softer and clearer skin is most commonly to be seen among them: but the skin of the greatest part of these people, is of a dull hue, with a degree of roughness, particularly those parts that are uncovered, occasioned, probably, by some cutaneous disease. We saw a man at Hapae perfectly white, and a child equally so at Annamooka. In all countries containing black people, such phenomena are found, but they are caused, we imagine, by a disease. Upon the whole, however, few natural defects, or deformities, are to be seen among them; though we observed two or three with their feet bent inwards. Neither are they exempt from some diseases. Numbers are affected with the tetter or ring-worm, which leaves whitish serpentine marks behind it. They have another disease of a more mischievous nature, which is also very frequent, and appears on every part of the body, in large broad ulcers, discharging a thin clear pus, some of which had a very virulent appearance, particularly on the face. There were those, however, who appeared to be cured of it, and others mending; but it was generally attended

tended with the loss of the nose, or a considerable part of it. Two other diseases are also common among them; one of which is a firm swelling, affecting chiefly the legs and arms; the other is a tumour in the testicles, which sometimes exceed the size of two fists. In other respects they are remarkably healthy, not a single person having, during our stay, been confined to the house by any kind of sickness. Their strength and activity are, in every respect, answerable to their muscular appearance; and they exert both, in such a manner, as to prove, that they are as yet, little debilitated by the numerous diseases that are the natural consequences of indolence. The graceful mien, and firmness of step, with which they walk, are obvious proofs of their personal accomplishments. They consider this as a thing so necessary to be acquired, that their laughter was excited when they saw us frequently stumbling upon the roots of trees, or other inequalities, in walking. The mildness and good nature which they abundantly possess, are depicted on their countenances, totally free from that savage keenness, that always marks nations in a barbarous state. We might almost be induced to suppose, that they had been reared under the severest restrictions, seeing they have acquired so settled an aspect, such a command of their passions, and such a steadiness of conduct. At the same time, they are open, cheerful, and good humoured; though in the presence of their chiefs, they sometimes assume a degree of reserve, which has the appearance of gravity. Their pacific disposition is thoroughly evinced, from their friendly reception of all strangers. Instead of attacking them openly, or clandestinely, they have never appeared, in the smallest degree, hostile: but like the most civilized nations, have even courted an intercourse with their visitors, by bartering; a medium which unites all nations in a degree of friendship. So perfectly do they understand barter, that, at first, we supposed they had acquired the knowledge of it by trading with the neighbouring islands; but it afterwards appeared, that they had hardly any traffic, except with Feejee. No nation, perhaps, in the world, displayed, in their traffic, more honesty and less distrust. We permitted them safely to examine our goods, and they had the same implicit confidence in us. If either party seemed dissatisfied with his bargain, a re-exchange was made with mutual consent and satisfaction. Upon the whole, they seem to possess many of the most excellent qualities that adorn the human mind. A propensity to thieving is the only defect that seems to sully their fair character. Those of all ages, and both sexes, were addicted to it in an uncommon degree. It should be considered, however, that this exceptionable part of their conduct existed merely with respect to us; for in their general intercourse with each other, thefts are not more frequent than in other countries, where the dishonest practices of individuals will not authorise an indiscriminate censure on the people at large. Allowances should be made for the foibles of these poor islanders, whose minds we overpowered with the glare of new and captivating objects. Stealing, among civilized nations, denotes a character deeply stained with moral turpitude: but at the Friendly Islands, and others which we visited, the thefts committed by the natives, may have been occasioned by less culpable motives: they might be stimulated solely by curiosity; a desire to possess somewhat new; and the property of people very different from themselves. Were a set of beings, seemingly as superior to us, as we appeared in their eyes, to make their appearance among us, it might be possible that our natural regard to justice would not be able to restrain many from being guilty of the same erroneous practices. However, the thieving disposition of these islanders, was the means of affording us an insight into their ingenuity and quickness of intellects: for their petty thefts were managed with much dexterity; and those of greater consequence, with a settled plan or scheme, adapted to the importance of the objects.

The hair of these people is, in general, thick, straight, and strong, though some have it bushy or frizzled. The

natural colour appears to be black, but many of the men, and some of the women, stain it of a brown or purple colour; and a few give it an orange cast. The first of these colours is produced by applying a sort of plaister of burnt coral mixed with water; the second by the rasplings of a redish wood mixed into a poultice, and laid over the hair; and the third is said to be the effect of turmeric root. They are so whimsical in the fashions of wearing their hair, that it is difficult to say which is most in vogue. Some have none on one side of the head, while it remains long on the other: some have only a part of it cut short; others but a single lock on one side. There are again those who permit it to grow to its full length, without any such mutilations. The women usually wear it short: the beards of the men are usually cut in the same manner; and both sexes strip the hair from their armpits. The men are stained with a deep blue colour from the middle of the belly to half way down the thighs. This is effected with a flat bone instrument, full of fine teeth, which by a stroke of a bit of stick introduces the doo doo into the skin, whereby indelible marks are made. Lines and figures are thus traced, which, in some, are very elegant. The women have only small lines thus imprinted on the inside of the hands. As a mark of distinction, their kings are exempted from this custom. The men are circumcised in a partial manner. The operation consists in cutting off only a piece of the fore-skin at the upper part, whereby it is rendered incapable of ever covering the glans. This practice, at present, is founded only on a notion of cleanliness.

The dresses of both sexes is the same; consisting of a piece of cloth or matting, about two yards in breadth, and a half in length. It is double before, and, like a petticoat, hangs down to the middle of the leg. That part of the garment which is above the girdle, is plaited in several folds, and this, when extended, is sufficient to draw up and wrap round the shoulders. As to form, it is the general fashion; but the fine matting, and long pieces of cloth, are worn only by the superior class of people. The inferior sort are contented with small pieces, and, very often, have only a covering made of the leaves of plants, or the maro, a narrow piece of cloth, or matting, like a sash. This they pass between the thighs and round the waist. It is seldom used by the men. In their haivas, or grand entertainments, their dresses, though the same in form, are various, and embellished, more or less, with red feathers. Both men and women defend their faces occasionally from the sun with little bonnets, made of various sorts of materials. The ornaments, worn by those of either sex, are the same. The most common are necklaces, made of the fruit of pandanus, and various sweet smelling flowers, known by the general name of Kakulla. Others consist of small shells, sharks teeth, the wing and leg bones of small birds, &c. all which are pendant on the breast. In this manner they also wear a polished mother of pearl shell, or a ring on the upper part of the arm: rings of tortoise-shell on the fingers; and several of these joined together form bracelets for the wrists. Two holes are perforated in the lobes of the ears, wherein they put cylindrical bits of ivory, of the length of three inches, introduced at one hole, and drawn out of the other; or bits of reed filled with yellow pigment. This appears to be a fine powder of turmeric, which their women rub all over their bodies, in the same manner as the European ladies use their dry rouge upon their cheeks. Personal cleanliness is their study and delight. To maintain which they bathe frequently in the ponds, preferring them to the sea, though the water has an intolerable stench; when they are obliged to bathe in the sea, from a notion that salt water injures the skin, they will have fresh water poured over them to wash off its bad effects. They are extravagantly fond of cocoa-nut oil; a great quantity of which they pour upon their head and shoulders, and rub the body all over with a smaller quantity.

The domestic life of these people is neither so laborious as to be disagreeable, nor so free from employment

London. Published by J. M. W. Turner, at the King's Arms, No. 1, Pall Mall.

ment as to suffer them to degenerate into indolence. Their country has been so favoured by nature, that the first can scarcely occur; and their active disposition seems to be a sufficient bar to the last. By this fortunate concurrence of circumstances, their necessary labour yields, in its turn, to their amusements and recreations, which are never interrupted by the thoughts of being obliged to recur to business, till they are induced by satiety to wish for that transition. The employment of the women is not fatiguing, and is generally such as they can without difficulty execute in the house. The making of cloth is entirely entrusted to their care; the process of which manufacture has been already described. Their cloth is of different degrees of fineness; the coarser kind does not receive the impression of any pattern; but of the finer sorts, they have various patterns, differently coloured. The cloth, in general, is able to resist water for some time; but that which has the strongest glaze, is least liable to be penetrated thereby. Another manufacture, consigned also to the women, is that of their mats, which excel those of most other countries, both with respect to their texture and beauty. Of these there are seven or eight different sorts, used either for their dresses, or to sleep upon; but many are merely ornamental. These last are made chiefly from the tough, membranous part of the stock of the plantain-tree; those that they wear, are generally composed of the pandanus; and the coarser kind, whereon they sleep, are formed from a plant called Evarra. We observed several other articles that employ their females, as combs, of which they make great quantities; small baskets made of the same substance as the mats; and others, of the fibrous husk of the cocoa-nut, either interwoven with beads, or plain; all which are finished with extraordinary neatness and taste. The province of the men is, as might reasonably be expected, far more laborious and extensive than that of the other sex. Architecture, boat-building, agriculture, and fishing, constitute their principal occupations, and are the main objects of their attention. As cultivated roots and fruits form their chief subsistence, they find it necessary to practice husbandry, which, by their industry, they have brought to a degree of perfection. In managing yams and plantains, they dig small holes for their reception, and afterwards root up the surrounding grass. The instruments used for this purpose, are called hoo, and are nothing more than stakes of various lengths, flattened and sharpened to an edge at one end; and the largest ones have a short piece fixed transversely, by means of which they press the implement into the ground with the foot. When they plant the two above mentioned vegetables, they observe such particular exactness, that, which ever way you turn your eyes, the rows present themselves complete and regular. The bread-fruit and cocoa-nuts, are dispersed about, without any order; and when they have arrived at a certain height, give them little or no trouble. The same may be said of another large tree, producing a roundish compressed nut, called eecfee; and of a smaller one, bearing an oval nut, with two or three triangular kernels. The kappe is, in general, planted regularly, and in large spots; but the Mawhaha is interspersed among other things, as are also the yams and jecjee. Sugar cane is usually in small spots, closely crowded. The mulberry, of which the cloth is made, is kept very clean, and has a good space allowed for its growth. The pandanus is commonly planted in a row, close together, at the sides of the fields.

These people display very little taste or ingenuity in the construction of their houses. Those belonging to the common people are wretched huts, scarce sufficient to shelter them from the inclemency of the weather. Those of the better sort are larger, as well as more commodious and comfortable. A house of the middling size is of the following dimensions, namely, about 12 feet in height, 20 in breadth, and 30 in length. Their houses are, properly speaking, thatched roofs or sheds, supported by rafters and posts. The floor is raised with earth smoothed, and covered with thick

matting. Some habitations are open all round; but the major part of them are enclosed on the weather side with strong mats, or with branches of the cocoa-nut tree, plaited, or interwoven with each other. A thick mat, about three feet broad, bent into a semicircular form, and placed edgewise, with the ends touching the side of the house, encloses a sufficient space for the master and mistress to sleep in. The rest of the family sleep upon any part of the floor, the unmarried men and women lying apart from each other. If the family is large, they have little huts adjoining, in which the servants sleep. The whole of their furniture consists of some wooden stools, which serve them for pillows; baskets of different sizes, in which they put their combs, fish-hooks, and tools; two or three wooden bowls, in which they make kava; some cocoa-nut shells, a few gourds, and a bundle of cloth. But they are very skilful in building their canoes, which, indeed, are the most perfect of their mechanical productions. The double ones are very large, sufficiently so to carry about 50 persons, and they sail at a great rate. They fix upon them generally a hut or shed, for the reception of the master and his family. These are made of the bread-fruit tree, and the workmanship is extremely neat. They appear on the out-side as if they were composed of one solid piece; but upon closer inspection, they are found to consist of a great number of planks, fitting each other exactly, and by means of a ledge on the inside, are secured together with coccoline. The single canoes are furnished with an outrigger. The only tools which they make use of in the construction of these boats, are hatchets, or adzes, of a smooth black stone; augers, made of sharks teeth; and rasps, composed of the rough skin of a fish, fastened on flat pieces of wood. The same tools are all they have for other works, except shells, which serve them for knives. Their cordage is made of the fibres of the cocoa-nut husk, which, though not more than 10 inches long, they plait about the size of a quill, to whatever length may be required, and roll it up into balls; and by twisting several of these together, they form their ropes of a larger size. Their fishing-lines are as strong and even as our best cord. Their small hooks consist entirely of pearl shell; but the large ones are only covered with it on the back; and the points of both are, in general, of tortoiseshell. With the large hooks they catch albacores, and bonettos, by putting them to a bamboo-rod, about 12 feet long, with a line of the same length. They have also a number of small seines, some of which are of the most delicate texture.

Their musical reeds or pipes, resembling the syrinx of the ancients, have eight or ten pieces placed parallel to each other, most of which are of unequal lengths. Their flutes are made of a joint of bamboo, about 18 inches long, and are closed at both ends, having a hole near each end, and four others; two of which, and only one of the first, are used by them in playing. They close the left nostril with the thumb of the left-hand, and blow into the hole at one end with the other nostril. The fore-finger of the right-hand is applied to the lowest hole on the right, and the middle finger of the left, to the first hole on that side. In this manner, with only three notes, they produce a pleasing, though simple harmony. Their nassia, or drum, has been described already. Their warlike weapons are clubs curiously ornamented, spears, and darts. They make bows and arrows, but these are intended for amusement, and not for the purposes of war. Their stools or rather pillows, are about two feet long, but only four or five inches in height, and near four in breadth, inclining downwards towards the middle, with four strong legs and circular feet; the whole composed of brown or black wood, neatly polished, and sometimes inlaid with ivory. They likewise inlay with ivory the handles of fly-flaps; and, with a shark's tooth, shape bones into figures of men, birds &c.

Their vegetable diet consists principally of plantains, cocoa-nuts, bread-fruit, and yams; and their chief articles of animal food are hogs, fish, and fowls; but the

the common people frequently eat rats. Hogs, fowls, and turtle, however, seem to be only occasional dainties, reserved for persons of rank. Their food is dressed by baking, as at Otaheite; and they make, from different sorts of fruit, several dishes, which are very good. They sometimes boil their fish in the green leaves of the plantain-tree, which serve as a bag to hold both fish and water: having tied them up, they wrap them again in three or four other leaves, and place them upon stones heated for the purpose: when sufficiently done, they not only eat the fish, but drink the liquor or soup. They are not very cleanly either in their cookery, or their meals, or manner of eating. Their usual drink is water, or cocoa-nut milk, the kava being only their morning beverage. The food that is served up to the chiefs is generally laid upon plantain-leaves. The king, at his meals, was commonly attended upon by three or four of the natives, one of whom cut large pieces of the fish, or of the joint; another afterwards divided it into mouthfuls, and the rest stood by the cocoa-nuts, and whatever else he might happen to want. We never saw a large company sit down to a sociable meal, by eating from the same dish. The women are not excluded from taking their daily repast in company with the men; but there are certain ranks that are not allowed either to eat or drink together. This distinction begins with his majesty, but where it ends we know not. These people rise at day-break, and retire to rest as soon as it becomes dark. They, for the most part, sleep also in the day-time, when the weather is very hot. They are fond of associating together: in consequence of which, it is not uncommon to find several houses empty, and the possessors of them assembled in some other house, or upon some convenient spot in the neighbourhood, where they relax themselves by conversation and other amusements. Their private diversions chiefly consist of dancing, singing, and music. When two or three women snap their fingers, and sing in concert, it is called oobai; but when there are more, they form several parties, each of which sings in a different key; whereby an agreeable melody is made, termed heeva, or haiva. The songs are generally accompanied with the music of their flutes. The dances both of the men and women, are performed with an ease and grace not easily to be described. We could not determine with precision, whether their marriages were rendered durable by any kind of solemn contract: it is certain, however, that the major part of the people contented themselves with one wife. The chiefs, indeed, have commonly several women, though there was only one (as we thought) who was considered in the light of mistress of the family, a circumstance remarked among all nations where concubinage and polygamy were allowed. Though female chastity seemed to be held in little estimation, not a single breach of conjugal fidelity happened, to our knowledge, during the whole time of our continuance at these islands; nor were the unmarried women of rank more liberal of their favours: but numbers were of a different character; yet most, if not all of them, of the lowest class of people; and such of those who permitted familiarities to our crews, were prostitutes by profession.

The concern shewn by these islanders for the dead, is a strong proof of their humanity. Besides the Tooge, of which mention has been made before, and burnt circles, and scars, they strike a shark's tooth into their heads, till the blood flows plentifully, beat their teeth with stones, and thrust spears not only through their cheeks into their mouths, but also into the inner part of their thighs, and into their sides; so that, to use a common expression, their mourning may be said to be not in words but deeds. And such a rigorous discipline must, one would think, require an uncommon degree of affection, or the most gross superstition, to exact. It is highly probable the last has a share in it; for many could not have any knowledge of the person for whom their concern was expressed. We saw the people of Tongataboo deploring the death of a chief at Vivaoo; and other similar instances occurred during our stay. The more painful operations, however, are practiced

only when they mourn the death of those most nearly connected with them. When a person dies, he is wrapped up in mats, or cloth, or both, and then interred. The Fiatookas seem to be appropriated to the chiefs, and other persons of distinction, but inferior people have no particular spot set apart for their burial. It is uncertain what mourning ceremonies follow the general one; but we are well assured of there being others which continue a long time; the funeral of Mareewagee's wife was attended with ceremonies of five days duration. These people seem to consider death as a great evil, to avert which they have a very singular custom. When Captain Cook, during his former voyage, visited these islands, he observed that many of the natives had one or both of their little fingers cut off; of the reason of which mutilation he could not then obtain a satisfactory account. But he was now informed, that they performed this operation when they are afflicted with some dangerous disorder, which they imagine may bring them to the grave. They suppose, that the little finger will be accepted of by the deity, as a kind of propitiatory sacrifice, sufficiently efficacious to procure their recovery. In cutting it off, they make use of a stone hatchet. We saw scarcely one person in ten who was not thus mutilated; and they sometimes cut so close, as to encroach upon that bone of the hand which joins the amputated finger. It is also common for the lower class of people to cut off a joint of their little finger, on account of the sickness of the chiefs to whom they respectively belong. When this rigid strictness with which they perform their mourning and religious ceremonies is considered, it might be expected, that they endeavoured thereby to secure to themselves eternal happiness; but their principal object regards things merely temporal; for they have apparently little conception of future punishment for sins committed in the present life. They believe, however, that they meet with just punishment in the present state; and, therefore, put every method in practice to render their divinities propitious. They admit a plurality of deities, all of them inferior to Kallafootonga, who, they say, is a female, and the supreme authoress of nature, residing above, and directing the wind, rain, thunder, &c. They are of opinion that when she is much displeased with them, the productions of the earth are blasted, many things consumed by lightning, and themselves afflicted with sickness and death; but that when her anger abates, every thing is immediately restored to its former state. Among their subordinate deities, they mention Futtafaihe, or Footafoa, who has the administration of the sea, and its productions; Toofoa-boolootoo, god of the clouds and fogs; Tallettebo, Mattaba, Tareeava, and others. The same system of principles does not extend all over the Friendly Islands; the supreme deity of Hapae, for instance, being called Alo Alo. They entertain very absurd opinions relative to the power and various attributes of their gods, who, they suppose, have no further concern with them after death. They have, however, juster sentiments respecting the immortality of the soul, which they call life, the living principle, or an Otoo, that is a divinity. They imagine that, immediately after death, the souls of their chiefs are separated from their bodies, and go to a delightful region called Boolootoo, the god of which is stiled Gooleho, by whom they probably personify death. His country, according to their mythology, is the general repository of the dead; and they who are once conveyed thither die no more, and feast on all the favourite productions of their native soil, with which this blissful abode is supposed by them to be plentifully furnished. The souls of those in the lowest rank of the people are said to suffer a kind of transmigration; or are eaten up, they think, by a bird, called Laota, which walks over the graves with that intent. They do not worship any visible part of the creation, or any thing made with their own hands: nor do they make any offerings of dogs, hogs, and fruit (as is the custom at Otaheite) unless emblematically: but there is no reason to doubt of their offering up human sacrifices. Their Fiatookas, or Morais, are, in general, burying-grounds

THE HISTORY OF THE EMPIRE OF THE ROMANS

London Published by the Author, 1840. The King's Arms, Van Praet, 1840.

grounds and places of worship: some of them, however, appeared to be appropriated only to the former purpose; but these were final, and very inferior to the rest.

We are acquainted only with the general outlines of their government. A subordination, resembling the feudal system of our ancestors in Europe, is established among them; but of its subdivisions, and the constituent parts, we are ignorant. By some of the natives we were informed, that the king's power is unlimited, and that he has the absolute disposal of the lives and properties of his subjects; yet the few circumstances that fell under our observation, contradicted, rather than confirmed, the idea of a despotic sway. Mareewagee, Feenou, and Old Toobou, acted each the part of a petty sovereign, and not unfrequently counteracted the measures of the king. Nor was the court of Poulaho superior in splendor to those of Old Toobou and Mareewagee, who, next to his majesty, were the most potent chiefs in these islands; and after them Feenou appeared to stand highest in rank and authority. But, however independent on the king the principal men may be, the inferior people are totally subject to the will of the chiefs to whom they severally belong. The island of Tongataboo is divided into numerous districts, each of which has its peculiar chief, who distributes justice, and decides disputes within his own territory. Most of these chieftains have estates in other islands, whence they procure supplies. The king, at stated times, receives the productions of his distant domains, at Tongataboo, which is not only the usual place of his residence, but the abode of most persons of distinction among these islands. Its inhabitants call it frequently the Land of Chiefs, and stigmatize the subordinate isles with the appellation of Lands of Servants. The chiefs are styled by the people Lords of the Earth, and also of the sun and sky. The royal family assume the name of Futtafaihe, from the god distinguished by that title, who is probably considered by them as their tutelary patron. The king's peculiar title is simply Tooe Tonga. The order and decorum observed in his presence, and likewise in that of the other chiefs, are truly admirable. Whenever he sits down, all the attendants seat themselves before him, forming a semi-circle, and leaving a sufficient space between them and him, into which no one, unless he has particular business, presumes to enter; nor is any one suffered to sit, or pass behind him, or even near him, without his permission. When a person wishes to speak to his majesty, he comes forward, and having seated himself before him, delivers in a few words what he has to say; then, after being favoured with an answer, retires. If the king speaks to any one, the latter gives an answer from his seat, unless he is to receive an order; in which case he rises from his place, and seats himself cross-legged. Captain King has affirmed, that this posture is peculiar to the men, for the females, that gentleman says, always sit with both their legs thrown a little on one side. To speak to the king standing would here be considered as a glaring mark of rudeness. None of the most civilized nations have ever exceeded these islanders in the great order and regularity maintained on every occasion, in ready and submissive compliance with the commands of their superiors, and in the perfect harmony that subsists among all ranks. Such a behaviour manifests itself in a remarkable manner, whenever their chiefs harangue a body of them assembled together, which frequently happens. The greatest attention and most profound silence are observed during the harangue; and whatever might be the purport of the oration, we never saw a single instance, when any one of those who were present, shewed signs of being displeased, or seemed in the least inclined to dispute the declared will of the speaker. It is a peculiar privilege annexed to the person of the king, not to be punctured, nor circumcised, as all his subjects are. Whenever he walks out, all who meet him must sit down till he has passed. No person is suffered to be over his head; but all must, on the contrary, come under his feet. The method of doing homage to him,

No. 58.

and the other chiefs, is as follows: the person who is to pay obeisance, squats down before the great personage, and bows the head down to the sole of his foot, which he taps or touches, with the upper and under side of the fingers of each hand; then rising up, he retires. We had reason to think, that his majesty cannot refuse any one who is desirous of paying him this homage, called by the natives moe moea; for the people would frequently think proper to shew him these marks of submission when he was walking; and, on such occasions, he was obliged to stop, and hold up one of his feet behind him, till they had performed this respectful ceremony. This, to so corpulent and unweildy a man as Poulaho, must have been troublesome and painful; and we have seen him sometimes endeavour, by running, to get out of the way, or to reach a convenient place for sitting down. The hands, after having been thus applied, become in some cases, useless a short time; for till these are washed, they must not touch food of any kind. This prohibition, in a country, where water is far from being plentiful, would be attended with an inconvenience, if a piece of any juicy plant, which they can immediately procure, being rubbed over the hands, did not serve for the purpose of purification. When thus circumstanced, they term their situation taboo rema; the former word generally signifying forbidden, and the latter implying hand. When the taboo is incurred, by doing homage to a person of rank, it may thus be easily washed off; but in several other cases, it must continue for a certain period. We have often seen women, who have been taboo rema, fed by others. The interdicted person, after the limited time is elapsed, washes herself in one of their baths, which are, in general, dirty ponds of brackish water. She then waits upon the king, and, after having paid the customary obeisance, takes hold of his foot, which she applies to her shoulders, breast, and other parts; he then embraces her on both shoulders, and she immediately retires, purified from her uncleanness. If it be always necessary to have recourse to his majesty for this purpose (of which we are not certain, though Omiah assured us it was) it may be one reason for his travelling very frequently from one island to another. The word taboo, as we have before observed, has a very extensive signification. They call human sacrifices, Tangata taboo; and when any particular thing is prohibited to be eaten, or made use of, they say it is taboo. We were told by them, that if the king should go into a house belonging to one of his subjects, that house would become taboo, and could never be again inhabited by the owner of it; so that, wherever his majesty travels, there are houses peculiarly assigned for his accommodation. At this time Old Toobou presided over the taboo; that is, if Omiah did not misunderstand those who gave him the intelligence, he, and his deputies, had the inspection of all the produce of the island, taking care that each individual should cultivate and plant his quota, and directing what should and what should not be eaten. By so prudent a regulation, they take effectual precautions against a famine; sufficient ground is employed in raising provisions; and every article is secured from unnecessary consumption. By another good regulation, an officer of rank is appointed to superintend the police. This department was administered, while we continued among them, by Feenou, whose business (as we were informed) it was, to punish all delinquents: he was also generalissimo, or commander in chief of the forces of the islands. Poulaho himself declared to us, that, if he should become a bad man, Feenou would dethrone, and kill him; by which he doubtless meant, that, if he neglected the duties of his high station, or governed in a manner that would prove prejudicial to the public welfare, Feenou would be desired by the other chiefs, or by the collective body of the people, to depose him from the supreme command, and put him to death. A king thus subject to controul and punishment for abuse of power, cannot justly be deemed a despotic prince. When we take into consideration the number of islands of which this state consists, and the distance of which

6 E

some

some of them are removed from the seat of government, attempts to throw off the yoke of subjection might be apprehended. But they informed us, that this circumstance never happens. One reason of their not being thus embroiled in domestic commotions may be this; that all the principal chiefs take up their residence at Tongataboo. They also secure the dependence of the other isles, by the decisive celerity of their operations: for if a seditious and popular man should start up in any of them, Feenou, or whoever happens to hold his office, is immediately dispatched thither to put him to death; by which means they extinguish an insurrection while it is yet in embryo. The different classes of their chiefs seemed to be nearly as numerous as among us; but there are few, comparatively speaking, that are lords of extensive districts of territory. It is said, that when a person of property dies, all his possessions devolve on the sovereign; but that it is customary to give them to the eldest son of the deceased, with this condition annexed, that he should provide, out of the estate, for the other children. The crown is hereditary; and we know, from a particular circumstance, that the Futtafaies, of which family is Poulaho, have reigned, in a direct line, for the space of at least one hundred and thirty-five years, which have elapsed between our present visit to these islands, and Tasman's discovery of them. Upon our inquiring, whether any traditional account of the arrival of Tasman's ships had been preserved among them, till this time, we found, that the history had been delivered down to them with great accuracy: for they said, that his two ships resembled ours; and also mentioned the place where they had lain at anchor; their having continued but a few days; and their quitting that station to go to Anamooka; and, for the purpose of informing us how long ago this affair had happened, they communicated to us the name of the Futtafaie who reigned at that time, and those who succeeded him in the sovereignty down to Poulaho, who is the fifth monarch since that period. It might be imagined, that the present reigning sovereign of the Friendly Isles had the highest rank in his dominions: but we found it otherwise; for Latoolibooloo, whom we have already noticed, and three ladies of rank, are superior in some respects to Poulaho himself. These great personages, are distinguished by the title of Tam-maha, which denotes a chief. When we made enquiry concerning them, we were informed that the late king, father of Poulaho, left behind him a sister of equal rank, and older than himself; that, by a native of Feejee, she had a son and two daughters; and that these three persons, as well as their mother, are of higher rank than the king. The mother, and one of her daughters, named Toocela-kaipa, reside at Vavaoo: the other daughter, called Mougoula-kaipa, and Latoolibooloo, the son, dwell at Tongataboo. Mougoula-kaipa, is the lady of quality whom we mentioned as having dined with Captain Cook on the 21st of June. Latoolibooloo is thought by his countrymen to be out of his senses. At Middleburgh, they shewed us a considerable quantity of land, said to be his property; and, at the same place, we saw a son of his, a child, who was honoured with the same respect, title, and homage as his father: and the natives much humoured and caressed this little Tammaha.

The language of these islands bears a great resemblance to that of Otaheite, as will appear from the following small collection of words, which we have endeavoured to make as correct as possible.

A TABLE, containing a short specimen of the Language of the FRIENDLY ISLANDS, with corresponding words of the same signification, as used in Otaheite.

FRIENDLY ISLES	OTAHEITE	ENGLISH
Koomoo	Ooma	<i>The Beard</i>
Wakka	Evaa	<i>A Boat or Canoe</i>
Oole	Ere	<i>Black</i>
Aho	Aou	<i>The Dawn</i>
Tareenga	Tareea	<i>The Ear</i>

Eafoi	Eahoi	<i>Fire</i>
Taheine	Toonea	<i>A Girl</i>
Fooroo	Eroroo	<i>The Hair</i>
Fonooa	Fenooa	<i>Land</i>
Tao	Tao	<i>A Lance or spear</i>
Tangata	Taata	<i>A Man</i>
Motooa	Madooa	<i>A Parent</i>
Ooha	Eooa	<i>Ram</i>
Goola	Oora oora	<i>Red</i>
Elaa	Eraa	<i>The Sun</i>
Mohe	Moe	<i>Sleep</i>
Tooa	Toutou or teou	<i>A Servant, or one of mean rank</i>
Tahee	Tace	<i>The Sea</i>
Fatoore	Patcere	<i>Thunder</i>
Elelo	Eroo	<i>The Tongue</i>
Amou	Mou	<i>To hold fast</i>
Horo	Horoce	<i>To wipe, or cleanse</i>
Matangce	Matace	<i>The Wind</i>
Avy	Evy	<i>Water</i>
Vefaine	Waheine	<i>A Woman</i>
Kohacea	Yahacea	<i>What is that?</i>
Mafanna	Mahanna	<i>Warm</i>
Ou	Wou	<i>I</i>
Koe	Oe	<i>Yes</i>
Ai	Ai	<i>Yes</i>
Kace	Ace	<i>No</i>
Ongofooroo	Ahooroo	<i>Ten</i>
Etoo	Atoo	<i>To rise up</i>
Tangee	Tace	<i>To shed tears</i>
Eky	Ey	<i>To eat</i>

We must here observe, that vocabularies of this kind cannot be entirely free from errors. These will unavoidably spring up from various causes. It will be difficult to fix the object of enquiry, when the conceptions of those from whom we are to learn the words, so widely differ from our own; nor could much be obtained from a preceptor who knew very few words of any language that his pupil was conversant with: but, what led us frequently into mistakes, was, the impossibility of catching the true sound of a word, to which our ears had never been accustomed, from persons, whose pronunciation seemed to us, in general, so indistinct, that two of us writing down the same word from the same mouth, made use, not only of different vowels, but even different consonants, the sounds of which are least liable to ambiguity. Besides, from the natives endeavouring to imitate us, or from our having misunderstood them, we were led into strange corruptions of words: thus, for example, cheeto, though totally different from the real word, in the language of Tongataboo, was always used by us to express a thief. This mistake took its rise from one, into which we had fallen, when at New Zealand. For though the word that signifies thief there, is the very same in the Friendly Islands (being Kaeehaa at both places) yet by some blunder we had used the word teete, first at New Zealand, and afterwards at Tongataboo; the natives whereof, endeavouring to imitate us as nearly as they could, fabricated the word cheeto; and this, by a complication of mistakes, was adopted by us as our own.

The language of the Friendly Islands bears a striking resemblance to that of new Zealand, of Otaheite, and all the Society Isles. Many of their words are also the same with those used by the inhabitants of Cocos Island, as may be seen by consulting a vocabulary made there by Le Maire and Schouten. And yet, though Tasman's people used the words of that vocabulary, in speaking to the natives of Tongataboo, (his Amsterdam) we are told, in the accounts of his voyage, that they did not understand one another: a circumstance worthy of notice; as it shews how cautious we ought to be, upon the scanty evidence afforded by such transient visits as Tasman's, and we may say, as those of most of the subsequent navigators of the Pacific Ocean, to found any argument about the affinity, or want of affinity, of the languages of different islands. No person will venture to say now, that a Cocos man, and one of Tongataboo, could not understand each other.

other. Some of the words at Horn Island, another of Schouten's discoveries; are also a part of the language of Tongataboo.

The pronunciation of the natives of the Friendly Isles differs, indeed, in many instances, from that both of Otaheite and New Zealand; nevertheless a great number of words, are either very little changed, or exactly the same. The language spoken by the Friendly Islanders, is sufficiently copious to express all their ideas; and, besides being harmonious in common conversation, is easily adapted to the purposes of music, of which we had many proofs. As far as we could judge, from our short intercourse with the natives, its component parts are not numerous; and in some of its rules it agrees with other known languages: indeed it has none of the inflections of nouns and verbs, as in the Latin tongue; but we could discern easily the several degrees of comparison. Among hundreds of words we were able to collect, we found terms to express numbers as far as a hundred thousand, beyond which they either would not, or could not reckon: for having got thus far, they commonly used a word expressing an indefinite number.

At these islands the tides are more considerable, than at any other of Captain Cook's discoveries in this ocean, that are situated within either of the tropics. In the channels between the islands, it flows near tide and half tide; and it is only here and in a few places near the shores, that the tide is perceptible; so that we could guess only at the quarter from whence the flood comes.

In the road of Annamooka it sets W. S. W. and the ebb the contrary, but it falls into the harbour of Tongataboo from the N. W. passes through the two guts on each side of Hoolaiva, where it runs rapidly, and then spends itself in the Lagoon. The ebb returns the same way with rather greater force. The N. W. tide, at the entrance of the Lagoon, is met by one from the E. but this we found to be very inconsiderable. At Annamooka it is high water near six o'clock, on the full and change of the moon; and the tide rises and falls about six feet, upon a perpendicular. In the harbour of Tongataboo the tide rises and falls four feet three quarters on the full and change days, and three feet and a half at the quadratures.

During our stay here we had several favourable opportunities of making astronomical and nautical observations; whereby we ascertained the difference of longitude between Annamooka and Tongataboo with more exactness than was done in Captain Cook's second voyage. The latitude of the former is 20 deg. 15 min. S. and its longitude 185 deg. 11 min. 18 sec. E. The observatory was placed on the west side of this island: and near the middle of the north side of the island of Tongataboo, the latitude of which, according to the most accurate observations, we found to be 21 deg. 8 min. 19 sec. S. and its longitude 184 deg. 55 min. 18 sec. E. Having now concluded our remarks on the Friendly Islands, and the natives, we shall take a final leave of them, and resume in the next chapter, the prosecution of the history of our voyage.

C H A P. VII.

ON Thursday, the 17th of July, when steering for our intended port, the body of Eaoo, at eight o'clock in the evening, bore N. E. by N. distant three leagues. The wind blew a fresh gale at east; and we stood with it to the south, till after six o'clock the next morning, when, in latitude 22 deg. 24 min. S. a sudden squall took our ships aback, and before they could be trimmed on the other tack, the main-sail and top-gallant sails were much torn. On the 19th, the wind kept between the S. W. and S. E. and the next day veered to the E. N. E. and N. In the night between the 20th and 21st an eclipse of the moon was observed, when we found our ship to be in latitude 22 deg. 57 min. 30 sec. and in longitude 186 deg. 57 min. 30 sec. We continued to stretch to the E. S. E. without meeting with any thing remarkable till Tuesday the 29th, when, in latitude 28 deg. 6 min S. and in longitude 189 deg. 23 min. E. the weather became tempestuous, and a sudden squall carried away the main-top, and top-gallant-mast of the Discovery. She had also her jib carried away, and her main-sail split. It is astonishing to see with what spirit and alacrity English sailors exert themselves on such occasions. Amidst a storm, when it would have been almost impossible for a landman to have trusted himself upon deck, the sailors mounted aloft, and with incredible rapidity cleared away the wreck, by which they preserved the ship. Nothing equal to this disaster had happened to the Discovery in the course of her voyage. Nor did the Resolution escape the fury of this storm. We were, at this time, under single reefed top-sails, courses, and stay-sails. Two of

the latter were almost demolished, and it was with the utmost difficulty that we saved the other sails. The squall being over, we saw several lights moving on board the Discovery; whence we concluded that something had given way. Both wind and weather continued very unsettled till noon, when the latter cleared up, and the former settled in the N. W. quarter. This day we were visited by some pintado birds, which were the first we had seen since we left land. At noon, of the 31st, Captain Clerke made a signal to speak with us; and by the return of our boat we were informed, that the head of the Discovery's main-mast had sprung in such a manner, as to render the rigging of another top mast exceeding dangerous; that having lost his top-gallant-yard, he had not another on board, nor a spar to make one: we therefore sent him our sprit-sail top-sail-yard, which supplied this want for the present; and the next day, by getting up a jury-top-mast, on which was set a mizen-top-sail, the Discovery was enabled to keep way with the Resolution.

On Friday, the 1st of August, the Discovery's company celebrated the anniversary of their departure from England, having been just one year absent. The men were indulged with a double allowance of grog, and they forgot in the jollity of their cans, the hardships to which they had been exposed in the late storm. We steered E. N. E. and N. E. without meeting with any remarkable occurrence till Friday the 8th, when, at eleven o'clock, the man at the mast-head called out land, which we observed bearing N. N. E. nine or ten leagues

leagues distant. At first it appeared like separate islands; but as we approached, we found it was connected, forming one and the same island. We made directly for it, with a fine gale, and at seven o'clock, P. M. it extended from N. by E. to N. N. E. distant four leagues. On the 9th, at day break, we steered for the N. W. or lee side of the island; and as we stood round its S. W. part, we saw it guarded by a reef of coral-rock, extending in some places, at least, a mile from the land, and a high surf breaking over it. As we drew near, we saw people walking or running along shore, on several parts of the coast, and, in a short time after, when we had reached the lee side of the island, we saw two canoes, wherein were about a dozen men, who paddled towards us. In order to give these canoes time to come up with us, as well as to sound for anchorage, we shortened sail; and, at the distance of half a mile from the reef, we found from 40 to 35 fathoms water. The canoes having advanced within pistol-shot of the ships, suddenly stopped. We desired Omiah, as was usual on such occasions, to endeavour to prevail upon them to come nearer; but none of his arguments could induce them to trust themselves within our reach. They often pointed eagerly to the shore with their paddles; at the same time calling to us to go thither; and many of the people on the beach held up something white in their hands, which we construed as an invitation for us to land. We could easily have accomplished this, there being good anchorage without the reef, and an opening in it, through which the canoes had passed: but it was not thought prudent to risk the advantage of a fair wind, in order to examine an island that to us at present appeared to be of little consequence. We required no refreshments, if we had been certain of meeting with them there, and therefore, after having made several unsuccessful attempts, to prevail upon the islanders to come along side, we made sail to the north and left them; having first learned that the name of their island was Toobouai. It was a new discovery, situate in 23 deg. 25 min. S. latitude, and 210 deg. 37 min. E. longitude. A gentleman on board the *Discovery* says; the men appeared of the largest stature, and tattooed from head to foot; their language different from any we were yet acquainted with; their dress not unlike that of the Amsterdammers; their complexion darker; their heads ornamented with shells, feathers, and flowers; and their canoes neatly constructed and elegantly carved. Of their manners we could form little or no judgement. They appeared extremely timid; but, by their waving green boughs, and exhibiting other signs of peace, they gave us reason to believe that they were friendly. They exchanged some small fish and cocoa nuts for nails and Middleburgh cloth. In our approach to Toobouai, some of our gentlemen, on board the *Resolution*, made the few following remarks.

The greatest extent of this island, in any direction, is not above five or six miles: but the above gentleman, belonging to the *Discovery*, says, "Its greatest length is about twelve miles, and its breadth about four." Small, however, as it appeared to us, there are hills in it of a considerable elevation; at the foot of which is a narrow border of flat land, extending almost all round it; bordered with a white sand beach, except a few rocky cliffs in one part, with patches of trees interspersed to their summits. This island, as we were informed by the men in the canoes, is plentifully stocked with hogs and fowls; and produces the several kinds of fruits and trees that are to be met with in this neighbourhood. We discovered also, that the inhabitants of Toobouai speak the language of Otaheite; an indubitable proof that they are of the same nation. Those whom we, on board the *Resolution*, saw, were a stout copper coloured people; some of whom wore their hair (which was straight and black) flowing about the shoulders, and others had it tied in a bunch on the crown of the head. Their faces were roundish and full, but the features flat; and their countenances expressed a degree of natural ferocity. Their covering was a piece of narrow stuff wrapped round the waist, and

and passing between the thighs; but some of those whom we beheld upon the beach, were completely clothed in white. Some of our visitors, in the canoes, had their necks ornamented with pearl-shells; and one of them continued blowing a large conch-shell, to which a reed, of about two feet long, was fixed. He began in a long tone, without any variation, and afterwards converted it into a kind of musical instrument. Whether the blowing of the conch was with any particular view, or what it portended, we cannot say, but we never found it to be the messenger of peace. As to their canoes, they appeared to be about thirty feet long, and they rose about two feet above the surface of the water, as they floated. The fore-part projected a little; the after-part rose to the height of two or three feet, with a gradual curve, and, like the upper part of the sides, was carved all over. The rest of the sides were ornamented with flat white shells curiously disposed. There were eight men in one of the canoes, and seven in the other. They were conducted with small paddles, whose blades were almost circular; and they sometimes paddled with the two opposite sides so close together, that they appeared to be but one boat; the rowers occasionally turning their faces to the stern, and pulling towards it without turning the canoes round. Seeing we were determined to leave them, they stood up, and repeated something loud; but we knew not whether they were expressing hostile intentions, or friendship. It is certain, however, that they had not any weapons with them; nor could we with our glasses discover, that those on shore were armed.

Leaving this island, we proceeded, with an easy breeze, to the north, and on Tuesday the 12th, at day break, we came in sight of the island of Maitea. Soon after the man at the mast-head called out land, which proved to be the island of Otaheite, of which we were in search: the point of Otaite Peha, or Oheitepeha Bay, bearing west, four leagues distant. For this bay we steered, intending to anchor there, in order to procure some refreshments from the S. E. part of the island, before we sailed to Matavai, where we expected our principal supply. We had a fresh gale till two o'clock P. M. when at about a league from the bay, the wind suddenly died away. About two hours after, we had sudden squalls, with rain, from the east; so that, after having in vain attempted to gain the anchoring place, we were obliged to stand out, and spend the night at sea. As we approached the island, we were attended by several canoes, each containing two or three men: but being of the lower class, Omiah took no particular notice of them, nor they of him. They did not know that he was one of their countrymen, though they had conversed with him for some time. At length a chief, whom Captain Cook had known before, named Ootee, and Omiah's brother-in-law, who happened to be at this time, at this corner of the island, and three or four others, all of whom knew Omiah, before he embarked with Captain Furneaux, came on board; yet there was nothing in the least tender or striking in their meeting, but on the contrary, a perfect indifference on both sides, till Omiah, conducting his brother into the cabin, opened a drawer, and gave him a few red feathers: this circumstance being soon communicated to the rest of the natives on deck, Ootee, who before would hardly speak to him, now begged, that they might be Tayos (friends) and exchange names. Omiah readily accepted of the honour, and a present of red feathers ratified the agreement. By way of return, Ootee sent ashore for a hog. It was evident, however, to all of us present, that it was not the man, but his property, that they esteemed. Had he not displayed his treasure of red feathers, a commodity of great estimation in the island, it is a matter of doubt whether they would have bestowed a single cocoa-nut upon him. Such was Omiah's first reception among his countrymen; and though we did not expect it would be otherwise, yet still we hoped, that the valuable stock of presents, with which he had been possessed by the liberality of his friends in England, would be the certain means of raising him into consequence, among the

Portrait of POTATOW.

Portrait of OMAI.

first persons of rank throughout the Society Islands. This, indeed, must have been the case, had he conducted himself with any degree of prudence; but he paid little attention to the repeated advice of his best friends, and laid himself open to every imposition.

Through his means we were informed by the natives who came off to us, that since Captain Cook last visited this island in 1774, two ships had been twice in this bay, and had left animals there, resembling those we had on board: but on a minute enquiry into particulars, we found them to consist only of hogs, dogs, goats, a bull, and the male of another animal, which they so imperfectly described, that we could not conjecture what it was. These ships, they said, had come from a place, called Reema, which we supposed to be Lima, the capital of Peru, and that these late visitors were consequently Spaniards. They also told us, that the first time they arrived, they built a house, and left behind them two priests, a boy or servant, and a fourth person, whom they called Mateema, much spoken of at this time; taking away with them, when they failed, four of the natives: that about ten months afterwards, the same ships returned, bringing back only two of the natives, the other two having died at Lima; and that, after a short stay, they took away the people they had left, but that the house they had erected was now standing.

On Wednesday, the 13th, we were surrounded with an incredible number of canoes, crowded with people, who brought with them plenty of hogs and fruit: for the agreeable news of red feathers being on board the two ships, had been propagated by Omiah and his friends. A quantity of feathers, which might be taken from the body of a tom-rit, would, early in the morning, have purchased a hog of forty or fifty pounds weight: but as the whole ships crew were possessed of some of this precious article of trade, it decreased above five hundred per cent. in its value, in a few hours: however, the balance, even then, was in our favour considerably; and red feathers still preserved a superiority over every other commodity. Some of the natives would not dispose of a hog, without receiving an axe in exchange; as to nails, beads, and many other trinkets, which during our former voyages, were held in high estimation at this island, they were now so much despised, that few would even deign to look at them. Having had little wind all this morning, it was nine o'clock before we could get into the bay, where we moored with two bowers. Soon after Omiah's sister came on board, to congratulate him on his arrival. It was pleasing to observe, that, to the honour of both of these relations, their meeting was marked with the expressions of the tenderest affection, more easily conceived than described.

When this affecting scene was closed, and the ship properly moored, Omiah attended Captain Cook on shore. The Captain's first visit was paid to a personage, whom Omiah represented as a very extraordinary one indeed, nothing less, as he affirmed, than the God Bolabola. They found him seated under one of those awnings, which are usually carried in their larger canoes. He was old, and had so far lost the use of his limbs, that he was carried from place to place upon a hand barrow. By some he was called Olla, or Orra, which is the name of the God of Bolabola; but his real name was Etary. From Omiah's extraordinary account of this man, it was expected to have seen religious adoration paid to him; but very little was observed that distinguished him from other chiefs. Omiah presented to him a tuft of red feathers, fastened to the end of a small stick; but, after a little conversation, his attention was excited by the presence of his mother's sister, who was already at his feet, and had bedewed them plentifully with tears of joy. The Captain left him with the old lady in this situation, surrounded by a number of people, and went to take a view of the house, said to have been erected by the strangers who had lately landed here. He found it standing at a small distance from the beach; and composed of wooden materials, which appeared to have

been brought hither ready prepared, in order to set up as occasion might require, for the planks were all numbered. It consisted of two small rooms, in the inner of which were a bedstead, a bench, a table, some old hats, and other trifles, of which the natives seemed to be remarkably careful, as well as of the building itself, which had received no injury from the weather, a kind of shed having been erected over it, for its preservation. Scuttles, serving as air-holes, appeared all round the building; perhaps they might also be intended for the additional purpose of firing from, with muskets, should necessity require it; for the whole erection seemed to indicate a deeper design than the natives were aware of. At a little distance from the front of this building stood a wooden cross, on the transverse part of which was this inscription—*Christus vincit*—"Christ overcome"—and, on the perpendicular (which confirmed our conjecture, that the two ships were Spanish) was engraved—*Carolus III. imperat, 1774*—"In the reign of Charles the Third, 1774."—Captain Cook seeing this, very properly preserved the memory of the prior visits of the English, by inscribing—*Georgius tertius Rex, Annis, 1767, 1769, 1773, 1774, et 1777*—"King George the Third, in the years 1767, &c."—After which, the Captain told the natives who were present, to beware of their Spanish visitors, and not to be too fond of them. Near the foot of the cross the islanders pointed out to us the grave of the commodore of the two ships, who died here, while they lay in the bay, on their first arrival. His name, as near as we could gather from their pronunciation, was Oreede. The Spaniards, whatever their views might have been in visiting this island, seemed to have taken infinite pains to have ingratiated themselves with the natives, who, upon all occasions, mentioned them with the strongest terms of respect, esteem, and even veneration. On this occasion, the Captain met with no chief of any considerable note, excepting the aged person above described. Waheia dooa, king of Tiara-bo, (as this part of the island is called by the natives) was now absent; and we were afterwards informed, that, though his name was the same, he was not the same person as the chief whom Captain Cook had seen here in 1774; but his brother, a youth of ten years of age, who had succeeded the elder Waheia dooa. We also discovered, that the celebrated Oberea was dead; but that Otoo, and all our other friends were alive.

On the Captain's return from the house erected by the Spaniards, he found Omiah haranguing a very large company; and with difficulty could disengage him to accompany him aboard, where he had the following important matter to settle with the ships companies. Knowing that Otaheite, and the neighbouring islands, could supply us plentifully with cocoa-nuts, the liquor of which is a most excellent beverage, he wished to prevail upon those under his command to consent to be abridged, for a short time, of their allowance of spirits to mix with water. But as this, without assigning some powerful reason, might have occasioned a general murmur, he assembled our ship's company, to communicate to them the intent of the voyage, and the extent of our future operations. He took notice of the generous rewards offered, by parliament, to such who should first discover a communication between the Atlantic and Pacific Oceans, in the Northern Hemisphere, as well as to those who shall first penetrate beyond the 89th deg. of northern latitude. He said, he did not entertain a doubt, that he should find them ready to co-operate with him in attempting to one, or both these rewards; but, it would be necessary to be strictly economical in the expenditure of our stores and provisions, as we had not a chance of getting a supply after our departure from these islands. The Captain further observed, that the duration of our voyage would exceed by a year, at least, what had been originally supposed, by our having lost the opportunity of proceeding to the north this summer. He begged them to consider the various obstructions, and aggravated hardships, they must yet labour under, if necessity should oblige us to be put to short

allowance, of any kinds of provisions, in a cold climate. He therefore submitted to them, whether it would not be most advisable to be prudent in time, and rather than run the risk of having their spirits exhausted, when they might be most wanted, to consent to be without their grog at present, when we could supply its place with so excellent a liquor as that from the cocoa-nuts. He added, nevertheless, that he would leave the determination entirely to their own choice. This proposal did not remain a moment under consideration, and our commander had the satisfaction to find, that it was unanimously approved of. Upon this, he ordered Captain Clerke to make a similar proposal to his people, which they also readily agreed to. The serving of grog was therefore immediately stopped, except on Saturday nights, when all the men had a full allowance of it, to gratify them with drinking the healths of their female lasses in England; lest amidst the pretty girls of Otaheite, they should be totally forgotten.

Thursday the 14th we began some necessary operations, such as inspecting the provisions in the main and forehold; getting the casks of beef, pork, &c. out of the ground tier, and putting a quantity of ballast in their place. The ship was ordered to be caulked; which she stood in much need of; having, at times, made a considerable deal of water in our passage from the Friendly Isles. We also put our cattle on shore, and appointed two of our hands to look after them, while grazing; not intending to leave any of them on this part of the island. The two following days it rained most incessantly; notwithstanding which, we were visited by the natives from every quarter, the news of our arrival having most rapidly spread. Wahaiadooda, though at a considerable distance, had been informed of it, and in the afternoon of Saturday the 16th, a chief, named Etoorea, who was his tutor, brought the captain two hogs, acquainting him, at the same time, that he himself would attend him the day after. He was punctual to his promise; for on the 17th, early in the morning, Captain Cook received a message from Wahaiadooda, notifying his arrival, and requesting he would come ashore to meet him. In consequence of this invitation, Omiah and the captain prepared to make him a visit in form. Omiah, on this occasion, took some pains to dress himself, not after the manner of the English, nor that of Otaheite, or Tongataboo, or in the dress of any other country upon the earth; but in a strange medley of all the habiliments and ornaments he was possessed of. Thus equipped, on landing, they first paid a visit to Etary; who carried on a hand-barrow, accompanied them to a large building where he was set down: Omiah seated himself on one side of them, and the captain on the other. Wahaiadooda, the young chief, soon after arrived, attended by his mother, and several principal men, who all seated themselves opposite to us. One who sat near the captain, made a short speech, consisting of separate sentences; part of which was dictated by those about him. Another, on the opposite side, near the chief, spoke next; Etary after him, and then Omiah. The subjects of these orations were, Captain Cook's arrival, and his connections with them. Among other things, one of them told the captain, that the men of Reema desired they would not suffer him to come into Oheitepeha Bay, if he should return again to the island, for that it was their property; but that so far from regarding this request, he was authorized now to surrender to him the province of Tiaraboo, and every thing that was in it. Hence it is evident, that these people are no strangers to the policy of accommodating themselves to present circumstances. The young chief, at length, was directed to embrace Captain Cook; and, as a confirmation of this treaty of friendship, they exchanged names. After this ceremony was over, he and his friends accompanied the captain, to dine with him on board. Here Omiah prepared, as a present for Otoo, the king of the whole island, a maro, composed of red and yellow feathers; and, considering the place we were at, it was a present of great value. The captain

endeavoured to prevail on him not to produce it now, wishing him to wait till he might have an opportunity of presenting it to Otoo with his own hands. But he entertained too good an opinion of his countrymen, to be guided by his advice, he was determined to carry it ashore, and to entrust it with Wahaiadooda, to be forwarded by him to Otoo, and added to the royal maro. By this management he weakly imagined, he should oblige both chiefs; on the contrary, he highly disoblige him, whose favour was of the most consequence at this part of the island, without obtaining any reward from the other. The captain was prophetic on this occasion; for Wahaiadooda, as he expected, kept the maro for himself, and only sent to Otoo about a twentieth part of what composed the magnificent present.

Tuesday the 19th, it blew a hard gale, and we were obliged to veer out 20 fathom more of our best bower-cable, as we rode hard at our moorings. Most of the fresh provisions, with which we had been supplied at the Friendly Isles, having been expended in the voyage, orders were given to prohibit all trade with the natives, except for provisions; and that only with such persons as were appointed purveyors for the ships; by which prudent regulation, fresh provisions were soon procured in plenty, and every man was allowed a pound and a half of pork every day. In the morning, Captain Cook received from the young chief a present of ten hogs, some cloth, and a quantity of fruit. In the evening we exhibited and played off fire-works, which both pleased and astonished the numerous spectators. This day some of our gentlemen, in their walks, discovered, as they thought, a Roman Catholic Chapel. They described the altar, which, they said, they had seen, and every other constituent part of such a place of worship, yet, at the same time, they intimated, that two persons, who had the care of it, would not permit them to go in; on which account the Captain had the curiosity to survey it himself. The supposed chapel proved to be a Toopapoo, wherein the body of the late Wahaiadooda was deposited, in a kind of state. It lay in a pretty large house, enclosed with a low palisade. The Toopapoo was remarkably neat, and resembled one of those little awnings over their large canoes. It was hung and covered with mats and cloths of a variety of colours, which had a beautiful effect. One piece of scarlet broad-cloth of the length of four or five yards, appeared conspicuous among other ornaments, which probably had been received as a present from the Spaniards. This cloth, and some tassels of feathers, suggested to our gentlemen the idea of a chapel; and their imagination supplied whatever else was wanting to create a resemblance: hearing that the Spaniards had visited this place might also operate on their minds upon this occasion, and add to the probability of its being a chapel. Some small offerings of fruits and roots seemed to be made daily at this shrine, several pieces being now fresh. These were deposited on a kind of altar, which stood without the palisades; within which we were not permitted to enter. Two men constantly attend here, both night and day, as well to watch over the place, as to dress and undress the Toopapoo. When we came to view it, the cloth and its appendages were rolled up; but at the captain's request, the two attendants placed it in order, but not till after they had dressed themselves in white robes. The chief, we were informed, had been dead about 20 months.

On Friday the 22d, in the morning, the live stock were taken on board, and we prepared for sea. The next day, while the ships were unmooring, Omiah, Captain Cook, and other gentlemen, landed, in order to take leave of the young chief. While we were conversing with him, one of those persons they call Eatooas, from a persuasion that they possess the spirit of the divinity, presented himself before us. He had all the appearance of infanity; and his only covering was a quantity of plantain leaves wrapped round his waist. He uttered what he had to say in a low squeaking voice, so as hardly to be understood: but Omiah

A Representation of the Surrender of the Island of Otaheite to CAPTⁿ WALLIS, by the supposed Queen Oberea.

aid he perfectly comprehended him, and that he was advising young Waheia doo a not to accompany Captain Cook to Matavai, an expedition we did not know he intended, nor had the captain ever made such a proposal to him. The Eatooa also predicted, that the ships would not arrive that day at Matavai. In this, however, he was mistaken, though appearances, we confess, favoured his assertion, as, at the time, there was not a single breath of wind in any direction. While he was delivering his prophecy, a heavy shower of rain came on, which occasioned all to run for shelter, except himself, who affected to despise it. He continued squeaking about half an hour, and then retired. Little attention was paid to what he uttered; and some of the natives laughed at him. The captain asked the chief whether the enthusiast was an Earee, or a Tow-tow; he answered, that he was a bad man: and yet, notwithstanding this reply, and the little notice taken of the mad prophet, superstition so far governs the natives, that they absolutely believe such persons to be filled with the spirit of the Eatooa. Omiah seemed to be well instructed concerning them. He said, that, during the fits, with which they are seized, they know not any person, and that if any one of the inspired natives is a man of property, he will then give away every moveable he possesses, if his friends do not put them out of his reach; and, when he recovers, he seems not to have the least remembrance of what he had done during the time the frenzy, or fit, was upon him. We now returned on board, and soon after, a light breeze springing up at east, we got under sail, and the same evening anchored in Matavai Bay; but the Discovery did not get in till the next morning; consequently the man's prophecy was half fulfilled. In a journal belonging to one on board the Discovery, we find this account of her setting sail, and arrival at Matavai. "On the 23d, about nine o'clock, A. M. we weighed, and sailed, accompanied with several canoes, though the wind blew a storm, and we sailed under double-reefed top-sails. In the evening the Resolution took her old station in Matavai Bay; but the wind suddenly shifting, and the breeze coming full from the land, we were driven three leagues to the leeward of the bay, by which we were reduced to the necessity of working all night to windward, amidst thunder, lightning, and rain, and among reefs of coral rocks, on which we every moment expected to perish. We burnt false fires, and fired several guns of distress; but no answer from the Resolution, nor could we see any object to direct us, during this perilous night. In the morning of the 24th, the weather cleared up, and we could see the Resolution about three leagues to the windward of us, when a shift of wind happening in our favour, we took advantage of it, and by twelve at noon were safely moored within a cable's length of the Resolution."

It is impossible to give an adequate idea of the joy, which the natives expressed on our arrival. The shores every where resounded with the name of Cook: not a child that could lip Toote was silent. The manner whereby these people express their joy is so different from our sensations, that were we to see persons stabbing themselves with sharks teeth, till their bodies were besmeared with blood, we should think they were pierced with the most frantic despair, and that it would be almost impossible to assuage their grief; whereas, beating their breasts, tearing their hair, and wounding their heads and their bodies, are the most significant signs of their gladness to see their friends. But, at the same time, they are ready to overwhelm you with kindness, and would give you, for the moment, all they have in the world, yet the very next hour, they will crave all back again, and, like children, tease you for every thing you have got.

In the morning of this day being Sunday the 24th, Ottoo, the king of the whole island, accompanied by a great number of the natives, in their canoes, came from Oparree, his place of residence, and having landed on Matavai point, sent a messenger on board, intimating his desire to see Captain Cook there. The captain accord-

ingly went ashore, attended by Omiah, and some of the officers. We found a vast multitude of people assembled on this occasion, in the midst of whom was the king, with his father, his two brothers, and three sisters. The captain saluted him, and was followed by Omiah, who kneeled and embraced his legs. Though Omiah had prepared himself for this ceremony, by dressing himself in his best apparel, and behaved with great respect and modesty, yet very little notice was taken of him. He made the king a present of two yards of gold cloth, and a large tassel of red feathers; and the captain gave him a gold laced hat, a suit of fine linen, some tools, a quantity of red feathers, and one of the bonnets worn at the Friendly Islands. This visit being over, the king, and all the royal family, accompanied Captain Cook on board, followed by several canoes, plentifully laden with all kinds of provisions. Each family owned a part, so that the captain had a present from every one of them; and each received from him a separate present in return. Not long after, the king's mother came on board, bringing with her some provisions and cloth, which she divided between the captain and Omiah. Though the latter was but little noticed at first by his countrymen, they no sooner gained information of his wealth, than they began to court his friendship. Captain Cook encouraged this as far as lay in his power, being desirous of fixing him with Ottoo. Intending to leave all our European animals at this island, we thought Omiah would be able to give the natives some instruction with regard to their use and management, and the captain was convinced, that the farther he was removed from his native island, the more he would be respected. But unfortunately, Omiah rejected his advice, and behaved in so imprudent a manner, that he soon lost the friendship of Ottoo, and of all the most considerable people at Otaheite. He associated with none but vagabonds and strangers, whose sole intention was to plunder him; and if we had not interfered, they would not have left him a single article of any value. This conduct drew upon him the ill will of the principal chiefs; who found that they could not obtain, from any one in either ship, such valuable presents as were bestowed by Omiah on the lowest of the natives. After dinner, a party of us accompanied Ottoo to Oparree, taking with us some poultry, consisting of a peacock and hen, a turkey cock and hen, three geese and a gander, one duck and a drake. All these we left at Oparree, in the possession of Ottoo; and the geese and ducks began to breed before we sailed. We found there a gander, that Captain Wallis had given to Oberea ten years before; we also met with several goats, and the Spanish bull, a fine animal of his kind, whom they kept tied to a tree, near the habitation of Ottoo. He now belonged to Etary, and had been conveyed from Oheitepeha, to this place, in order to be shipped for Bolabola. On Monday the 25th, we sent to this bull, the three cows we had on board; also our English bull; but the horse, mare, and sheep, were put ashore at Matavai. Having thus disposed of these animals, we were now, to our great satisfaction, eased of the extraordinary trouble and vexation that had attended the bringing this living cargo to such a distance.

We shall here, for the entertainment of our readers, give an account of the reception the ships met with, on their arrival at this island, together with some other particulars, and transactions, all which we have taken from an original manuscript, sent us by a gentleman, on board the Discovery. A few hours after we were moored in the bay of Otaite Peha, Omiah took an airing on horseback, to the great astonishment of the inhabitants, many hundreds of whom followed him with loud acclamations. Omiah, to excite their admiration the more, was dressed cap-a-pee in a suit of armour, and was mounted and caparisoned with his sword and pike, like St. George going to kill the dragon, whom he very nearly represented; only that Omiah had pistols in his holsters, of which the bold saint knew not the use. Omiah, however, made good use of his arms; for when the crowd became clamorous and troublesome,

he every now and then pulled out a pistol; and fired it among them, which never failed to send them scampering away.

The ships were no sooner secured, than the sailors began stripping them of every foot of rigging they had left; for certainly no ships were in a more shattered condition. Our voyage from New Zealand, if not from the Cape, might be said to be one continued series of tempestuous weather, suspended only by a few intervals of sunshine; and the employment of our artificers at sea and on shore, a laborious exertion of their faculties to keep us above water. Here it was not only necessary to strip the main-mast of the *Discovery*; but to take it out, and carry it on shore, to be properly secured. This was a work of no small difficulty. Here too we found it necessary to unship our stores of every kind; to air and repack our powder; new bake that part of the bread that had contracted any dampness; to erect the forge on shore; in short to set all hands at work to refit the ships for the further prosecution of the voyage.

A messenger was dispatched from Captain Cook to king Otoo, to acquaint him with our arrival, and to desire his permission to send the cattle he had brought from England, to feed in the pastures of Oparree. The king expressed his joy on the return of Captain Cook, and readily gave his consent. He, at the same time, ordered one of his principal officers to accompany the messenger, in his return, and to take with him presents of fresh provisions for the commanders of both ships, and to invite them to dine with him the next day. This invitation was accepted, and it was agreed between the two Captains, that their visit should be made with as much state as their present circumstances would admit. The marines and music were therefore ordered to be in readiness at an appointed hour, and all the rowers to be clean dressed. We were now in Matavai harbour; and, on the 25th, about noon, the commanders, with the principal officers, and gentlemen, embarked on board the pinnaces, which, on this occasion, were decked in all the magnificence that silken streamers, embroidered ensigns, and other gorgeous decorations, could display. Omiah, to surprize the more, was clothed in a Captain's uniform, and could hardly be distinguished from a British officer. From Matavai to Oparree is about six miles; and we arrived at the landing-place at one o'clock, where we were received by the marines already under arms; and as soon as the company were disembarked, the whole band of music struck up a grand military march, and the procession began. The road from the beach to the entrance of the palace (about half a mile) was lined on both sides with natives from all parts, expecting to see Omiah on horseback, as the account of his appearance on the other side of the island, as before related, had already reached the inhabitants on this. As he appeared to them in disguise, he was not known: they were not, however, wholly disappointed, as the grandeur of the procession exceeded every thing of the kind they had ever seen. The whole court were likewise assembled, and the king, with his sisters, on the approach of Captain Cook, came forth to meet him. As he was perfectly known to them, their first salutations were frank and friendly, according to the known customs of the Otaheiteans; and when these were over, proper attention was paid to every gentleman in company, and that too with a politeness, quite unexpected to those who had never before been on this island. As soon as the company had entered the palace, and were seated, some discourse passed between the king and Captain Cook; after which, Omiah was presented to his majesty, and paid him the usual homage of a subject to a sovereign of that country, which consists of little more than being uncovered before him, and then entered into a familiar conversation on the subject of his travels. The Earees, or kings of this country, are not above discoursing with the meanest of their subjects; but Omiah, by being a favourite of the Earees of the ships, was now considered as a person of some rank. The king, impatient to hear his story, asked him a hun-

dred questions, before he gave him time to answer one. He enquired about the Earee-da-hai, or Great King of Pretanne; his place of residence; his court; his attendants; his warriors; his ships of war; his moral; the extent of his possessions; &c. Omiah did not fail to magnify the grandeur of the Great King. He represented the splendour of his court, by the brilliancy of the stars in the firmament; the extent of his dominions, by the vast expanse of heaven; the greatness of his power, by the thunder that shakes the earth. He said, the Great King of Pretanne had three hundred thousand warriors every day at his command, clothed like those who now attended the Earees of the ships; and more than double that number of sailors, who traversed the globe, from the rising of the sun to his setting; that his ships of war exceeded those at Matavai in magnitude, in the same proportion, as those exceeded the small canoes at Oparree. His majesty appeared all astonishment, and could not help interrupting him. He asked, if what he said was true, where the Great King could find people to navigate so many ships as covered the ocean? and if he could have men, where he could find provisions for so large a multitude? Omiah assured him, that in one city only, on the banks of a river, far removed from the sea, there were more people, than were contained in the whole group of islands with which his majesty was acquainted; that the country was full of large populous cities; notwithstanding which provisions were so plentiful, that for a few pieces of yellow metal, like those of which he had seen many, (meaning the medals given by Captain Cook to the chiefs) the Great King could purchase as much provisions as would maintain a sailor for a whole year. That in the country of the Great King, there are more than a hundred different kinds of four footed animals, from the size of a rat, to that of a stage erected on an ordinary canoe; and that all these animals are numerous in their several kinds, and propagate very fast. Omiah having, by this relation, obviated Otoo's doubts, adverted to his first questions. He said, the ships of war, in Pretanne, were furnished with poo-poos, (guns) each of which would receive the largest poo-poo his majesty had yet seen, within it; that some carried a hundred and more of those poo-poos, with suitable accommodations for a thousand fighting men, and stowage for all sorts of cordage, and warlike stores; besides provisions and water for a thousand or two thousand days; that they were sometimes abroad as long, fighting with the enemies of the Great King; that they carried with them frequently, in these expeditions, poo-poos that would hold a small hog, and which throw hollow globes of iron, of vast bigness, filled with fire and all manner of combustibles, and implements of destruction, to a great distance; a few of which, were they to be thrown among the fleet of Otaheite, would set them on fire, and destroy the whole navy, were they ever so numerous. The king seemed more astonished than delighted at this narration, and suddenly left Omiah, to join the company that were in conversation with Captain Cook. By this time dinner was nearly ready, and as soon as the company were properly seated, was brought in by as many tow-tows as there were persons to dine; besides these, the king, the two commanders, and Omiah, had each of them two persons of superior rank to attend them. The dinner consisted of fish and fowl of various kinds, dressed after their manner; barbecued pigs, stewed yams, and fruits of the most delicious flavour, all served with an ease, and regularity, that is seldom to be found at European tables, when the ladies are excluded from making part of the company. As soon as dinner was over, we were conducted to the theatre; where a company of players were in readiness to perform a dramatical entertainment. The drama was regularly divided into three acts: the first consisted of dancing and dumb show; the second of comedy, which, to those who understood the language, was very laughable; for Omiah, and the natives, appeared highly diverted the whole time; the last was a musical piece, in which the young princesses were the sole performers. Between the acts

some feats of arms were exhibited, by combatants with lances and clubs. One made the attack, the other stood upon the defensive. He who made the attack brandished his lance, and either threw, pushed, or used it in aid of his club. He who was upon the defensive, stuck the point of his lance in the ground, in an oblique direction, so that the upper part rose above his head; and by observing the eye of his enemy, parried his blows, or his strokes, by the motion of his lance, and it was rare that he was hurt by the club. If his antagonist struck at his legs, he shewed his agility by jumping over the club; and if at his head, he was no less nimble in crouching under it. Their dexterity consisted chiefly in the defence, otherwise the combat might have been fatal, which always ended in good humour. These entertainments, which generally last about four hours, are really diverting. In the hornpipe they excel the Europeans, their masters, for they had contortions of the face and muscles to the nimbleness of the foot that are inimitable, and would, in spite of our gravity, provoke laughter; their country dances are well regulated; and they have others of their own, that are equal to those of our best theatres: their comedy seems to consist of some simple story, made laughable by the manner of delivery, somewhat in the style of the merry-andrews formerly at Bartholomew-fair. Had Omiah been of a theatrical cast, he doubtless might have very much improved their stage, for their performers appear inferior to none in the powers of imitation. The play being over, and night approaching, our commanders took their leave, after inviting the king and his attendants to dine aboard the Resolution. We were conducted to the water side in the same manner as we approached the palace, and were attended by the king and royal family. The next morning Omiah's mother, and several of his relations arrived. Their meeting was too unnatural to be pleasing. We could not see a woman frantically striking her face and arms with sharks teeth, till she was all over besmeared with blood, without being hurt: as it conveyed no idea of joy to feeling minds, we never could be reconciled to this absurd custom. She brought with her several large hogs, with bread fruit, bananas, and other productions of the island of Ulitea, as presents to the Captains, and she and her friends received, in return, a great variety of cutlery, such as knives, scissars, files, &c. besides some red feathers, which last were more acceptable than iron. They continued to visit the ship, occasionally, till she quitted the island.

In the afternoon, King Otoo, with his chiefs and attendants, and two young princesses, his sisters, performers in the interlude of the preceding night, came on board, bringing with them six large hogs, with a proportionable quantity of fruits of various kinds. They were entertained, as usual, with a sight of all the curiosities on board the ship, and the young princesses, longing for almost every thing they saw, were gratified, to their utmost wishes, with bracelets of beads, looking glasses, bits of china, artificial nosegays, and a variety of other trinkets, of which they had one of each sort, while, at the same time, the king and his chiefs amused themselves with the carpenters, armourers, and other workmen, employed in the repairs of the ship, casting longing eyes on their tools, and implements. In this manner they past their time till dinner was ready. Otoo, with his chiefs, dined with the Captains, the principal officers, and Omiah, in the great cabin, while the ladies were feasted in an apartment separated on purpose, and waited upon by their own servants. After dinner the king and his nobles were pressed to drink wine; but most of them, having felt its power, declined tasting it; one or two drank a glass, but refused a second one. When the tables were cleared, the ladies joined the company, and then horn-pipes and country dances, after the English manner, commenced, in which they joined with great good humour. What contributed not a little to increase the pleasure of the king, was a present made him by Captain Cook of a quantity of the choicest red feathers that could be purchased at Amsterdam. Red feathers, (as has been already observed) are held in the highest estimation in

Otaheite, and in all the Society Islands, but more particularly by the chiefs of the former island, by whom they are used as amulets, or rather as propitiations to make their prayers acceptable to the good spirit, whom they invoke with tufts of those feathers in their hands, made up in a peculiar manner, and held up in a certain position with much solemnity. The ordinary sorts of red feathers were collected by our officers and men all over the Friendly Islands; but those that were now presented to Otoo, were of a superior kind, in value as much above the ordinary red feathers, as real pearls are in value above French paste. They were taken from the heads of the paroquets of Tongataboo and Ea-oo-whe, which are of superlative beauty, and precious in proportion to their fineness, and the vivid glow of their precious colours. Here we learnt, that Captain Cook, in his former voyage, being in great distress for provisions, and having been plentifully supplied with them by Otoo, promised, that if ever he should return to Otaheite, he would make his majesty richer in ouravine (precious feathers) than all the princes in the neighbouring isles. This gave rise to an opinion, that it was to fulfil this promise, that we were led so far out of our way, as we have remarked in its proper place: but there is much more reason to conclude, that the strong easterly winds which prevailed when we approached the southern tropic, made our direct course to Otaheite impracticable. Had the Captain regarded his promise to Otoo as inviolable, he would most certainly have shaped his course from New Zealand to the Friendly Islands, the nearest way, which would have shortened our voyage several months; unless we can suppose, that he had forgotten his promise, and that when he came within a few days sail of his destined port, he recollected himself, and then changed his direction to enable him to keep his word. To which of these causes it was owing we must leave to futurity; for to us, who were not in the secret, it is to this day a mystery. We were advanced some degrees to the eastward of Hervey's Isles, which lie in latitude 19 deg. 18 min. S. and in 201 deg. E. longitude, before we altered our course to the westward, to make for Amsterdam, which lies in 21 deg. 15 min. S. and 183 deg. E. longitude, whereas the island of Ulitea, of which Omiah was a native, lay in latitude 16 deg. 45 min. and longitude 208 deg. 35 min. Why our course to the former was preferred to the latter, involves the mystery.

Though all public trade was prohibited, as was usual, till the ships should be furnished with fresh provisions, it was not easy to restrain the men on shore from trading with the women, who were continually enticing them to desert. The ladies of pleasure, in London, have not half the winning ways that are practised by the Otaheitean misses, to allure their gallants. With the seeming innocence of doves, they mingle the wiliness of serpents. They have, however, one quality peculiar to themselves, that is constancy. When once they have made their choice, it must be owing to the sailor himself, if his mistress proves false to him. No women on earth are more faithful. They will endeavour to gain all their lovers possess; but they will suffer no one else to invade their property, nor will they embezzle any part of it themselves, without having first obtained consent; but that consent is not easily withheld; for they are incessant in their importunities, and will never cease asking, while the sailor has a rag to bestow. During our stay at this island, we had hardly a sailor, who had not made a very near connection with one or other of the female inhabitants; nor, indeed, many officers who were proof against the allurements of the better sort, who were no less amorous and artful, though more reserved, than the inferior order. The temperature of the climate, the plenty of fresh provisions, fish, fowl, pork, bread-fruit, yams (a kind of sweet potatoes, which they have the art of stewing with their pork in a very savoury manner) added to the delicious fruits of the island, contributed not a little to make our stay here even desirable; nor did idleness get possession of those who were most indolently inclined; we had not

a vacant hour between business and pleasure that was unemployed: we wanted no coffee houses to kill time; nor Vauxhalls for our evening entertainments. Every nightly assembly, in the plantations of this happy isle, is furnished, by beneficent nature, with a more luxurious feast than all the dainties of the most sumptuous champêtre, though lavished with unlimited profusion, and emblazoned with the most expensive decorations of art. Ten thousand lamps, combined and ranged in the most advantageous order, by the hands of the best artist, appear faint, when compared with the brilliant stars of heaven that unite their splendor, to illuminate the groves, the lawns, and streams of Oparree. In these elysian fields, immortality alone is wanting to the enjoyment of all those pleasures which the poet's fancy has conferred on the shades of departed heroes, as the highest reward of heroic virtue. But amidst so many delights, it was not for human nature to subsist long without satiety. Our officers began to be punctilious, and our seamen to be licentious. Several of the latter were punished severely for indecency, in surpassing the natives by the shameless manner of indulging their sensual appetites; and two of the former went ashore to terminate an affair of honour by the decision of their pistols. It happened, that neither of them were dextrous marksmen: they vented their rage by the fury with which they began the attack; and, having discharged three balls each, they returned on board without any hurt, except spoiling a hat, a ball having pierced it, and grazed upon the head of him who wore it. It was, however, remarked, that these gentlemen were better friends than ever, during the remainder of the voyage. Thus far we have copied this journalist; and now proceed with our own history.

On Tuesday, the 26th, as the Captain intended to continue here some time, we set up our two observatories on Matavai Point: and adjoining to them two tents were pitched, for the reception of a guard, and of such people as might be left on shore, in different departments. The command, at this station, was intrusted to Mr. King, who likewise attended the astronomical observations. While we remained here, the crews of both ships were occupied in many necessary operations. The Discovery's main-mast, that was shattered in the head, and carried ashore to be repaired, was rendered more firm than ever: the sails that had been split, and were otherwise rendered unfit for service, were replaced, the cordage carefully examined; the mast new rigged; the water casks repaired; both ships new caulked; the bread inspected: in short, the whole repairs completed, with more celerity and strength, than could have been expected in a place, where many conveniences were wanted, to fit us out for that part of our voyage which still remained to be performed. This day a piece of ground was cleared for a garden, and planted with several articles, very few of which will, probably, be looked after by the natives. Some potatoes, melons, and pine-apple plants, were in a fair way of succeeding before we quitted the place. We had brought from the Friendly Islands several shaddock trees, which we planted here; and they will in all probability succeed, unless their growth should be checked by the same idle curiosity which destroyed a vine planted at Oheitepeha by the Spaniards. Many of the natives assembled to taste the first fruit it produced; but the grapes being still sour, they considered it as little better than poison, and trod it under foot. In that state Omiah accidentally found it, and was rejoiced at the discovery; for he was confident, that if he had but grapes, he could easily make wine. Accordingly, he had several slips cut off from the tree, with an intention of carrying them away with him; and we pruned, and put in order, the remains of it. Before we had been two days at anchor in Matavai Bay, we were visited by all our old friends, whose names are mentioned in the narrative of Captain Cook's former voyage. Not one of them came with empty hands; so that we had an amazing quantity of provisions, without any apprehensions of exhausting the island, which presented to our eyes every mark of the most exuberant fertility and abund-

ance. Soon after we had arrived here, one of the islanders, whom the Spaniards had carried with them to Lima, paid us a visit: but, in his exterior appearance, he was not distinguishable from the rest of the countrymen. He still remembered some Spanish words, among which the most frequent were *Si Senor*. We also found here the young man whom we had called Oedidee, but whose real name is Heete-heete. Captain Cook had carried him from Ulitea, on board his ship, in 1773, and brought him back in the year following, after he had visited the Friendly Islands, New Zealand, Easter Island, and the Marquesas. He had come from Bolabola, of which he was a native, to Otaheite, about three months before, probably with the sole view of gratifying his curiosity. He preferred the modes, and even dress of his countrymen to ours; for, though Captain Cook gave him some clothes, which our Board of Admiralty had thought proper to send for his use, he, after a few days, declined wearing them. This instance, as well as that of the person who had been at Lima, may be adduced as a proof of the strong inclination of mankind, in general, to habits acquired at an early age; and it is, perhaps, no unreasonable supposition, that even Omiah, who had imbibed almost the whole English manners, will, in a short time after being left by us, return, like Oedidee, and the visitor of Lima, to his own native garments, and his original mode of life.

On Wednesday, the 27th, we were informed by a man who came from Oheitepeha, that two Spanish ships had anchored in that bay the preceding night; and, to confirm this intelligence, he produced some coarse blue cloth, which, he said, he had got out of one of the ships. He further said, that Mateema was with the people, and that the two ships would be at Matavai in two or three days. These, and some other circumstances, which he mentioned, gave the story so much the appearance of truth, that our Commodore dispatched Lieutenant Williamson in a boat, to look into Oheitepeha bay; and, in the meantime, both ships were put into a proper posture of defence: for though England and Spain were at peace when we left England, we did not know but that a different scene might, by this time, have been opened. Upon enquiry, however, we had reason to imagine, that the relator of the story had imposed upon us; and this was put beyond all doubt, when Mr. Williamson returned the day following, who made his report, that he had been at Oheitepeha, and did not find any ships there, nor had any been there since we left it. The people of this part of the island, where we were stationed, told us indeed at first, that it was a fiction, invented by those of Tiaraboo, but with what view it was propagated among our people, we could not conceive, unless they might suppose, that the report would induce us to quit the island, and thus deprive the inhabitants of Otaheite-nooe of the advantages they might otherwise reap from our ships remaining there; the natives of the two parts of the island being inveterate enemies to each other. Since we arrived at Matavai, the weather had been very unsettled till the 29th, on account of which, before this time we were unable to get equal altitudes of the sun, for ascertaining the going of the time-keeper. In the evening of this day, the islanders made a precipitate retreat, both from our land station, and from on board the ships. We conjectured that this arose from their knowing some theft had been committed, and apprehending punishment on that account. At length we became acquainted with the whole affair. One of the surgeon's mates had made an excursion into the country, to purchase curiosities, and had taken with him four hatchets for the purpose of exchange. He having been so imprudent as to employ a native to carry them, the fellow took an opportunity of running off with so valuable a prize. This was the reason of the sudden flight, in which Otoo himself, and all his family, had joined; and it was with difficulty that the Captain stopped them, after having followed them for the space of two or three miles. As the Captain had determined to take no harsh measures for the recovery of the hatchets, that his people

HUMAN SACRIFICE, &c. MORATA OTAHETTE: in the presence of CAPT. COOK, &c.

for the future might be more upon their guard against such negligence, every thing resumed quickly its former tranquility.

Saturday the 30th, some messengers arrived from Eimeo with intelligence, that the people of that island were in arms; and that Otoo's partizans there had been compelled by the opposite party to retreat to the mountains. The quarrel between the two islands, which began in 1774, had partly subsisted ever since. A formidable armament had sailed soon after Captain Cook left Otaheite, in his former voyage; but the malecontents of Eimeo had made so gallant a resistance, that the fleet had returned without success; and now another expedition was deemed necessary. On the arrival of the messengers, the chiefs assembled at Otoo's house, where the captain actually was at that time, and had the honour of being admitted into their council. One of the messengers opened the business with a speech of considerable length, the purport of which was to explain the situation of affairs at Eimeo, and to excite the Otaheiteans to arm on the occasion. This opinion was opposed by others, who were against commencing hostilities; and the debate, for some time was carried on with great order and decorum. A length, however, the whole assembly became very tumultuous, and the captain began to think, that their meeting would conclude like a Polish diet. But the contending chiefs cooled as fast as they grew warm, and order was speedily restored. In the end, the party for war prevailed; and it was resolved, though not unanimously, that a strong force should be sent to Eimeo. Otoo said very little, during the whole debate. Those of the council inclinable to war, applied to our commodore for his assistance; and all of them were desirous of knowing what part he would take. Omiah was sent for to act as his interpreter; but as he could not be found, the captain, being under a necessity of speaking for himself, told them, as well as he could, that, as he was not perfectly acquainted with the dispute, and as the natives of Eimeo had never given him the least offence, he could not think of engaging in hostilities against them. With this declaration they either were, or appeared to be satisfied. The council was now dissolved; but before the captain retired, Otoo desired him to come again in the afternoon, and bring Omiah with him. A party of us accordingly waited upon him at the appointed time; and he conducted us to his father, in whose presence the dispute with the natives of Eimeo was again discussed. Captain Cook being very desirous of effecting an accommodation, founded the old chief on that subject; but he was deaf to any such proposal, and fully determined to carry on hostilities. On our enquiring into the cause of the war, we were informed, that several years ago, a brother of Waheia-dooa, of Tiaraboo, was sent to Eimeo, at the desire of Maheine, a popular chief of that island, to be their king; but had not been there many days, before Maheine, having caused him to be put to death, set up for himself, in opposition to Tiera-taboonooe, nephew of the deceased, who now became the lawful heir, or perhaps had been appointed by the people of Otaheite, to succeed to the government on the death of the other. Towha, who is related to Otoo, and chief of the district of Tettaha, and who had been commander in chief of the armament sent against Eimeo in 1774, happened not to be at Matavai at this time, and therefore was not present at the consultations. It appeared, however, that he was no stranger to what had happened, and that he entered into the transactions with great eagerness and spirit: for on the rumour of a war, it was computed, that near 300 canoes were mustered in Matavai Bay, with stages to each, whereon sat from three to six chiefs in their warlike dresses; which seemed calculated for show rather than use in battle. On their heads were large turbans wound round in many folds; over that a monstrous helmet; and on their bodies, instead of the light airy dress worn in common, they were incumbered by many garments of their own cloth, which added indeed to their stature, but which must disable them to exert their strength in

the day of battle. Men of fertile imagination, fond of tracing the analogy of ancient customs, among the different nations of the world, might possibly discover some similarity between these cumbrous dresses, and those of the knights of ancient chivalry, who fought in armour. It is certain that the Otaheitean who fights on foot must feel the same incumbrance from his heavy war-dress, as the ancient knight, who fought on horseback must have done, from his unweildy armour; and there is no doubt but the former will, one time or other, be laid aside in the tropical isles, as much as the latter is now in every other part of the world.

On Monday the 1st of September, a messenger arrived from Towha, to acquaint Otoo, that he had killed a man to be sacrificed to the Eatooa, with the view of imploring the assistance of the deity against Eimeo. This solemn oblation was to be offered at the great Morai, at Attahooroo, and Otoo's presence was necessary on the occasion. That such kind of sacrifices constitute a part of the religious ceremonies of the Otaheiteans, had been asserted by Mons. Bougainville, on the testimony of the native whom he took to France. In our last visit to Otaheite, we had satisfied ourselves, that such a practice, however inconsistent with the general humanity of the people, was here adopted. But this was one of those uncommon facts, concerning the truth of which many will not be convinced, unless the relator himself has had ocular proof to support his assertion; for this reason, Captain Cook requested of Otoo, that he might be allowed to accompany him, and, by being present at the solemnity, might obtain the highest evidence of its certainty. To this the king readily assented, and we immediately set out in the captain's boat, accompanied by our old friend Potatou, Mr. Anderson and Mr. Webber; Omiah following us in his canoe. We landed in our way, on a small island, lying off Tettaha, where we found Towha and his attendants. After a little conversation between the two chiefs, on the subject of the war, Towha addressed himself to the captain, soliciting his assistance. When the latter excused himself, Towha seemed displeased, thinking it rather extraordinary, that one who had constantly declared himself the friend of their island, should now refuse to fight against its enemies. Before we separated, Towha gave to Otoo two or three red feathers, tied up in a tuft, and a half-starved dog was put into a canoe that was to accompany us. Our party now reembarked, taking with us a priest, who was to assist at the offering of the human sacrifice. About two o'clock, we landed at Attahooroo, when Otoo desired that the sailors might be ordered to continue in the boat; and that Captain Cook, Mr. Anderson, and Mr. Webber, would take off their hats as soon as they should come to the Morai. To this we immediately proceeded, followed by numbers of men, and some boys; but not one woman was present. We found four priests with their assistants waiting for us; and on our arrival the ceremonies commenced. The dead body or sacrifice was in a small canoe, that lay on the beach, fronting the Morai. Two of the priests, with several of their attendants, were sitting by the canoe that lay on the beach; the others at the Morai. Our company stopped at the distance of twenty or thirty paces from the priests. Here Otoo placed himself; our gentlemen, and a few others, standing by him, while the bulk of the people were removed at a greater distance. One of the assistants of the priests now brought a young plantain tree, and laid it down before the king. Another approached, bearing a small tuft of red feathers, twisted on some fibres of the cocoa-nut husk, with which he touched one of Otoo's feet, and afterwards retired with it to his companions. One of the priests who were seated at the Morai, now began a long prayer, and, at particular times, sent down young plantain trees, which were placed upon the sacrifice. During this prayer, one of the natives, who stood by the officiating priest, held in his hands two bundles, in one of which, as we afterwards found, was the royal maro; and the other, if we may be allowed the expression, was the ark of the Eatooa. The prayer being

being finished, the priests at the Morai, with their assistants, went and sat down by those who were upon the beach, carrying the two bundles with them. They here renewed their prayers; during which the plantain trees were taken, one by one, at various times, from off the dead body, which, being wrapped up in cocoa-leaves and small branches, was now taken out of the canoe, and laid upon the beach. The priests placed themselves round it; some standing, and others sitting; and one, or more of them, repeated sentences for about ten minutes. The body was now stripped of the leaves and branches, and placed parallel with the sea-shore. Then one of the priests standing at the feet of the corpse, pronounced a long prayer, in which he was joined occasionally by others, each of them holding a tuft of red feathers in his hand. While this prayer was repeating, some hair was pulled off the head of the intended sacrifice, and the left eye was taken out; both which being wrapped up in a green leaf, were presented to the king, who, however, did not touch them, but gave to the man who brought them to him, the tuft of red feathers which he had received from Towha. This, with the eye and hair, were taken to the priests. Not long after this the king sent them another bunch of feathers. In the course of this last ceremony, a king-fisher making a noise, Otoo, turning to Captain Cook, said, "That is the Eatooa;" and he seemed to consider it as a favourable prognostic. The corpse was then carried a little way, and laid under a tree, near which were fixed three thin pieces of wood neatly carved. The bundles of cloth were placed on a part of the Morai; and the tufts of red feathers were laid at the feet of the dead body, round which the priests stationed themselves; and we were at this time permitted to go as near as we pleased. He, who seemed to be the chief priest, spoke for about a quarter of an hour, with different tones and gestures; sometimes appearing to expostulate with the deceased; at other times, asking several questions; then making various demands, as if the dead person had power himself, or interest with the deity, to engage him to grant such requests; among which, he desired him to deliver Eimeo, Mahine its chief, the women, hogs, and other things of the island into their hands; which was, indeed, the express object of the sacrifice. He then prayed near half an hour, in a whining tone, and two other priests joined in the prayer, in the course of which one of them plucked some more hair from the head of the corpse, and put it upon one of the bundles. The high priest now prayed alone, holding in his hand the feathers he had received from Towha. Having finished, he gave them to another priest, who prayed in like manner: then all the tufts of feathers were placed upon the bundles of cloth, which concluded the ceremony at this place.

The dead body was now carried to the most conspicuous part of the Morai, with the feathers, and the two bundles of cloth, while the drums beat slowly. The feathers and bundles were laid against a pile of stones, and the body at the foot of them. The priests having again seated themselves round the corpse, renewed their prayers, while some of their assistants dug a hole about the depth of two feet, into which they threw the victim, and covered it over with stones of earth. While they were depositing the body in the grave, a boy squeaked aloud, upon which Omiah told the captain, it was the Eatooa. In the mean time, a fire having been made, we saw a lean half starved dog produced, and it was killed by twisting his neck. The hair was then singed off, and the entrails being taken out, they were thrown into the fire, and left there to be consumed; but the kidney, heart, and liver, were baked on heated stones. The carcase, after having been rubbed over with the blood of the animal, were with the liver, &c. laid down before the priests, who were seated round the grave, praying. They, for some time, uttered ejaculations over the dog, while two men, at intervals, beat very loud on two drums; and a boy screamed, in a loud shrill voice, three times. This, they said, was to invite the Eatooa to feast on the banquet that they had provided for him.

When the priests had finished their prayers, the body, heart, liver, &c. of the dog, were placed on a whatta, or scaffold, about six feet in height, on which lay the remains of two other dogs, and of two pigs, that had been lately offered up. The priests and their attendants now gave a shout, and this proclaimed the ceremonies ended for the present. The evening being arrived, we were conducted to a house belonging to Potatou, where we were entertained and lodged for the night. Having been informed, that the religious rites were to be renewed the next day, we would not quit the place while any thing remained to be seen.

Early in the morning of Tuesday the 2nd, we repaired to the scene of action; and soon afterwards a pig was sacrificed, and laid upon the same scaffold with the others. About eight, Otoo took our party to the Morai, where the priests, and a great multitude of people were by this time assembled. The two bundles occupied the place where they had been deposited the preceding evening; the two drums were in the front of the Morai, and the priests were stationed beyond them. The king placed himself between the drums, and desired the captain to stand by him. The ceremony commenced with bringing a young plantain tree, and laying it at the king's feet. A prayer was then repeated by the priests, holding in their hands several tufts of red, and a plume of ostrich feathers; which the commodore had presented to Otoo on his first arrival. When the priests had ended the prayer, they changed their station, and placed themselves between our gentlemen and the Morai. One of them, the same who had performed the principal part the preceding day, began another prayer, which continued near half an hour. During this prayer, the tufts of red feathers were put, one by one, upon the ark of the Eatooa. Not long after, four pigs were produced, one of which was killed immediately, and the three others were taken to a neighbouring fly. One of the bundles was now untied; and it contained the Maro, with which the Otaheiteans invest their kings. When taken out of the cloth, it was spread on the ground, at full length, before the priests. It is a girdle about 15 feet in length, and one foot and a quarter in breadth, and is probably put on in the same manner as the common Maro, or piece of cloth, used by these islanders to wrap round the waist. It was ornamented with yellow and red feathers; but principally with the former. One end of it was bordered with eight pieces, about the size and figure of a horse-shoe, whose edges were fringed with black feathers: the other end was forked, having the points of various lengths. The feathers were ranged in two rows, in square compartments, and produced a pleasing effect. They had been first fixed upon some of the cloth of the island, and then sewed to the upper end of the pendant, which Captain Wallis had left flying on the shore, the first time of his arrival at Maravai. The priests pronounced a long prayer, relative to this part of the ceremony; and after it was ended, the badge of royalty was folded up with great care, and put into the cloth. The other bundle, which we have already mentioned, under the name of the ark, was next opened at one end; but we were not permitted to approach near enough to examine its mysterious contents. The intelligence we obtained respecting its contents was, that the Eatooa (or rather, what is supposed to represent him) was concealed therein. This sacred repository is composed of the twisted fibres of the husk of the coconut, and its figure is nearly circular, with one end considerably thicker than the other. The pig that had been killed was by this time cleaned, and its entrails taken out. These happened to have many of those convulsive motions, which frequently appear, in different parts, when an animal is killed; and this was considered as a very favourable omen to the intended expedition. After having been exposed for some time, the entrails were carried and laid down before the priests; one of whom closely inspected them, turning them for this purpose gently with a stick. Having been sufficiently examined, they were thrown into the fire. The sacrificed pig, and its liver, heart, &c. were now put upon the

the scaffold where the dog had been deposited; and then all the feathers, except the ostrich plume, being enclosed in the ark, an end was put to the whole solemnity.

We shall close this account with a few other observations we made in the course of this morning. Four double canoes remained upon the beach the whole time, before the place of sacrifice. A small platform, covered with palm leaves, fastened in mysterious knots, was fixed on the fore part of each of those canoes; and this also is called a Morai. Some plantains, cocoa-nuts, bread-fruit, fish, and other articles, lay upon each of those naval morais. The natives said, that they belonged to the Eatooa, and that they were to attend the fleet that was to be sent out against Eimeo. The unfortunate victim offered on this occasion, was to appearance, a middle aged man, and one of the lowest class of the people; but it did not appear that they had fixed upon him on account of his having committed any particular crime that deserved death. It is certain, however, that they usually select such guilty persons for sacrifices, or else vagabonds, who have no visible way of procuring an honest livelihood. Having examined the body of the unhappy sufferer, now offered up to the object of these people's adoration, we observed, that it was bloody about the head, and much bruised upon the right temple, which denoted the manner in which he had been killed; and we were informed, that he had been knocked on the head with a stone. The wretches who are devoted on these occasions, are never previously apprized of their fate. Whenever any one of the principal chiefs conceives a human sacrifice necessary, on any great emergency, he fixes upon the victim, and then dispatches some of his trusty servants, who fall upon him suddenly, and either stone him to death, or beat out his brains with a club. The king is then acquainted with it, whose presence is said to be absolutely necessary at the solemn rites that follow; and, indeed, in the late performance, Otoo bore a capital part. The solemnity itself is called Poore Eree, or the prayer of the chief: and the victim is termed Taata-taboo, or consecrated man. The Morai, where the late sacrifice was offered, is always appropriated for the burial of the king of the whole island, and likewise of his family, and some other persons of distinguished rank. It differs little except in extent, from the common Morais. Its principal part is a large oblong pile of stones, about thirteen feet in height, and contracted towards the top, with a quadrangular area on each side, loosely paved with pebbles, under which the bones of the chiefs are deposited. Not far from the end nearest the sea, is the place of sacrifice, where is a very large whatta, or scaffold, on which the offerings of fruits, and other vegetables are placed; but the animals are laid on a smaller one, and the human sacrifices are interred under the pavement. We saw several reliques scattered about the place; such as small stones raised in various parts of the pavement, some with bits of cloth fastened round them; others entirely covered with it; and upon the side of the large pile, fronting the area, are a great number of pieces of carved wood, in which their gods are supposed to reside occasionally. There is a heap of stones, at one end of the large scaffold, with a sort of platform on one side. On this are deposited all the skulls of the human sacrifices, which are taken up after they have remained under ground for some months. Just above them many of the carved pieces of wood are placed; and here the Maro, and the other bundle, supposed to contain the god Ooro, were laid, during the celebration of the late solemn rites. It is probable, that this barbarous custom of offering human sacrifices, prevails in all, or most of the islands of the Pacific Ocean, however distant from each other some of them may be. And though we should suppose, that not more than one person is offered at one time, either at Otaheite, or other islands, yet these occasions, we are inclined to think, occur so frequently, as to make a terrible havock of the human species; for the Captain counted no less than

49 skulls of former victims, lying before the Morai, at Attahooroo; and as none of those skulls appeared to have suffered any considerable change, or decay, from the weather, it may be inferred, that a short time had elapsed since the victims to whom they belonged had been offered. This horrid practice, though no consideration whatever can make it cease to be detestable, might, perhaps, be thought less detrimental, in some respects, if it contributed to impress any awe for the deity, or veneration for religion, upon the minds of the congregation: but this was far from being the case on the late occasion; for though a vast number of spectators had assembled at the Morai, they shewed very little reverence for what was transacting: and Omiah happening to arrive, after the ceremonies had begun, many of the islanders thronged round him, and were engaged, for the remaining part of the time, in making him recount some of his adventures; to which they listened with great eagerness of attention, regardless of the solemn offices which their priests were then performing. Indeed, the priests themselves, except the one who sustained the principal part, either from their being familiarized to such objects, or from their reposing no great degree of confidence in the efficacy of their religious institutions, maintained very little of that solemnity, so necessary to give to acts of devotion their proper effect. Their habit was but an ordinary one; they conversed together with great familiarity; and the only attempt they made to preserve decorum, was by exerting their authority, to prevent the populace from encroaching on the spot, and to suffer our gentlemen, as strangers, to come forward. They were, however, very candid in the answers which they gave to any interrogatories that were put to them, with regard to this human institution. Being asked, what was the design of it? They replied, that it was an ancient custom, and highly pleasing to their god, who came and fed upon the sacrifices; in consequence of which, he granted the petitions of their prayers. It was then objected, that he certainly did not feed on these, as he was neither seen to do it, nor were the bodies of the sacrificed animals soon consumed; and that as to the corpse of a human victim, they prevented his feeding on that, by interring it. In answer to these objections, which in our opinion were rather frivolous ones, they observed, that he came in the night, invisibly, and fed only on the soul, or immaterial part, which (as these people say) remains about the place of sacrifice, till the carcase of the victim is totally wasted by putrefaction. Human sacrifices are not the only strange customs that still prevail among the inhabitants of Otaheite, though, in many respects, they have emerged from the brutal manners of savage life. Besides cutting out the jaw bones of their enemies slain in battle, which they carry about with them as trophies, they, in some measure, offer up their bodies to the Eatooa: for after an engagement, in which they have come off victorious, they collect all the dead, and bring them to the Morai, where with great form and ceremony, they dig a large hole, and bury them all in it, as so many offerings to their divinities. They treat in a different manner their own chiefs that fall in battle. Their late king, Tootaha, Tubourai-tamaide, and another chief, who were slain in an engagement with those of Tiaraboo, were brought to the Morai at Attahooroo; at which place the priests cut out their bowels before the great altar; and their dead bodies were afterwards interred in three different places, near the great pile of stones abovementioned; and the common men who lost their lives in the battle, were all buried in one hole, at the foot of the same pile. This was performed the day after the battle, with much pomp and formality, amidst a numerous concourse of people, as a thanksgiving offering to the deity, for the victory they had obtained the preceding day. The vanquished, in the mean time, had taken refuge in the mountains, where they remained upwards of a week, till the fury of the victors began to abate. A treaty was then set on foot, by which it was agreed, that Otoo should be proclaimed king of the

whole island; and the solemnity of investing him with the Maro, or badge of royalty, was performed at the same Morai, with great magnificence.

A gentleman on board the *Discovery*, to whose journal, in the narrative of this voyage, we have had frequently recourse to, in his remarks on the manners and customs of the inhabitants of Otaheite, makes the following observations. The journalist, as he says, was attentive only to two facts, one of which, he found reason to believe, had been misrepresented, and the other unfairly related. The first respects the society of the Arreos, composed, as it was said, of a certain number of men and women, associated in lewdness, and so abandoned to all sense of humanity, as to destroy the issue of their libidinous intercourse; than which nothing could be more injurious to the characters of any people, than this diabolical practice ascribed to this society. There are in this, and the adjoining islands, persons of a middle rank between the Manahounas, or the Yeomen, and the Earees, who having no concern in the government, nor any distinct property in the islands, associate together for their own amusement, and the entertainment of the public. These travel from place to place, and from island to island in companies, not unlike those of the strolling players in England, only that they perform without pay; but that they cohabit indiscriminately, one with another, so many men with so many women in common, is no otherwise true, than may be suspected among the itinerant companies just mentioned; nor are they under any other restraints from marrying than that the society admits of no marriages among themselves, nor of any married people to be of their society, it being a rule with them never to be encumbered with children; if therefore it should happen, that issue should prove to be the consequence of a casual amour, there is no alternative, the mother must either quit the society, or some how or other dis-

pose of the child, which some of them do there, as many unfortunate girls do here, by secretly making away with them, to avoid infamy, it being equally disgraceful there to be found with child, while members of the society of Arreos, as it is for women here to be found without husbands. Oedidee, who made the voyage to the southward with Captain Cook, in his former expedition to discover a southern continent, came to pay his respects to his patron and friend. He brought with him a wife whom he had lately married, which discredits the notion that was adopted by former voyagers, that those who belonged to the society of Arreos were sworn to celibacy. Either this man must have been an impostor, or the fact just mentioned cannot be true.

The other fact, which the writer took pains to determine, was, whether the beastly custom imputed to them, of gratifying their passions without regard to persons or places, was well founded? And he solemnly declares, that the grossest indecencies he ever saw practised while on the island, were by the licentiousness of our own people, who, without regard to character, made no scruple to attempt openly and by force, what they were unable to effect with the free voluntary consent of the objects of their desire; for which several of them were severely punished. To assert, therefore, that not the least trace of shame is to be found among these people, in doing that openly, which all other people are naturally induced to hide, is an injurious calumny, not warranted by custom, nor supported by the general practice, even of the lowest class of individuals among them. This people, concludes our journalist, have one custom in common with the Neapolitans and Maltese, which ought not to be forgotten, and that is, their fishing in the night, and reposing themselves in the day: like them too, they burn torches while they fish, which they make of the oil drawn from the cocoa-nut.

C H A P. VIII.

*The party at the conclusion of the Solemnity at the Morai, re-embarked for Matavai—Conference with Towha respecting the human Sacrifice—Private Hevas among the Natives—A treat given by Oedidee, and another by Omiab—Exhibition of Fire-works—A present of Cloth made in an unusual Manner—A method of embalming the dead Body of a Chief—A second human Sacrifice—The two Captains entertain the Natives by riding on Horse-back—Attention of Otoo to prevent Theft—Animals given him by Captain Cook—Audience to the Deputies of a Chief—A mock Fight exhibited by two War-canoes—Naval strength of the Society Islands—Manner of conducting a War—The day for the two Ships sailing fixed—Peace made with Eimeo—Debates in consequence of this—Otoo's conduct censured—A solemnity on the occasion—Observations—Otoo's policy—Omiab receives a present of a war canoe—Otoo's present and message to the King of Great Britain—An Account of the modes of Traffic, and the friendly Treatment we received at Otaheite—More particulars respecting the expedition of the Spaniards—Their endeavours to inculcate a mean opinion of the English—Omiab's jealousy of another Traveller—The Resolution and Discovery depart from Otaheite, and anchor at Taloo in the Island of Eimeo—Two Harbours, Toloo, and Parowroah described—Visit from Mabeine, and a Description of his Person—Preparations made for sailing—Detained by having a Goat stolen—Another purloined, and secreted—Measures taken, and an expedition cross the Island to recover it—Houses and Canoes burnt—Continuation of Hostilities threatened—The Goat restored—A description of the Island of Eimeo—The two Ships set Sail, and arrive at Huabeine—An assembly of the Chiefs—Omiab's Establishment in this Island agreed to unanimously—In consequence of this a House is built for him, and steps taken to ensure his safety—A Chief punished with uncommon Severity—Animals left with Omiab—His Weapons—Entertainments—Inspection on his House—Behaviour at parting—Remarks on his Character and general Conduct—Observations on the two New Zealanders who remained with him—The two Ships proceed to Ulitea—A Deserter belonging to the *Maries* recovered—Intelligence from Omiab—Instructions to Captain Clerke—Two of the Mariners desert—The Chief's Son, Daughter and her Husband, confined on board the *Discovery*—A conspiracy formed by the Natives against the two Captains—The Deserters recovered, and the Chief's family set at Liberty—The Resolution and Discovery prepare for their Departure from Ulitea.*

ON Tuesday, the 2nd of September, we re-embarked, in order to return to Matavai, revolving in our minds the extraordinary scene at the morai, as related in the preceding chapter, and to which we had been eye-witnesses. In the way, we paid a visit to Towha, who had continued in the little island, where we met him the day before. Some conversation passed between him and Otoo; and the latter entreated Captain Cook, once more, to join them as an ally in their war against Eimeo. By his positive refusal he entirely lost the good opinion of this chief. Before we took our leave, Otoo took an occasion to speak of the solemnity, at which we had been present. Among

other interrogatories, he asked particularly, If it answered our expectations? What opinion we entertained of its efficacy? And, whether such religious acts and ceremonies were frequent in our own country? We had been silent during the celebration of the horrid ceremony; but, at the close of the extraordinary scene, freely expressed our sentiments on the subject to Otoo, and his attendants; consequently, Captain Cook did not conceal his detestation of it, in this conversation with Towha. Exclusive of the barbarity of the bloody custom, he urged the unreasonableness of it, alledging, that such a sacrifice, instead of making the Earees propitious to their nation, would excite his vengeance; and that,

that, from this very circumstance, he concluded, their intended expedition against Maheine would be unsuccessful. This was proceeding to great lengths upon conjecture; but there was little danger of being mistaken; for, respecting this war, three parties were formed in the island, one violent in its favour, another indifferent about it, and a third the avowed supporters of Maheine, and his cause. Under these circumstances, it was not probable that such a plan of military operations would be settled, as could insure success. Omiah acted as interpreter, in conveying the Captain's sentiments on this subject to Towha, and he supported his objections with such spirit, that the chief appeared to be extremely angry; especially, on being informed, that if he had taken away the life of a man in England, as he had done here, his rank would not have protected him from an ignominious death. Upon this he exclaimed, *maeno! maeno!* (vile! vile!) and would not hear a syllable more about it. Many of the natives were present at this debate; particularly the servants and attendants of Towha; and when Omiah mentioned the punishment that would be inflicted, in England, upon the greatest chief, if he dared to kill the meanest servant, they listened very attentively; and perhaps, on this subject, they thought differently from their master. Leaving Towha, we proceeded to Oparree, where Otoo solicited us to pass the night. We landed in the evening, and on our way to his habitation, had an opportunity of observing how these people amuse themselves in their private heevas. We saw about a hundred of them sitting in a house; in the midst of whom were two women, and an old man behind each of them, beating gently on a drum, and the women, at intervals, singing with great softness and delicacy. The assembly were very attentive, and seemed, as it were, absorbed in the pleasure the music gave them; few of them taking any notice of us, and the performers never once ceased. When we arrived at Otoo's house it was almost dark. Here we were entertained with one of their public heevas, or plays, in which his three sisters represented principal characters. This they call a heeva raa, and no person is suffered to enter the house, or area, where it is exhibited. This is always the case, when the royal sisters are performers. There is a sameness in their drama, that admits of little or no variation, as, perhaps, to foreigners, who are unacquainted with the language and manners of a country, there may appear to be in every stage exhibition, wherever performed. Be that as it may, we now beheld a more numerous and brilliant company of performers assembled for our entertainment, than we had ever seen on any stage in the tropical islands before. On this occasion, the dresses were entirely new, and by far more elegant and picturesque than formerly; the number of dancers were increased; and they acquitted themselves in a very distinguished manner. Ten young ladies composed the first group, with their heads most magnificently ornamented with beads, red feathers, shells of the most beautiful colours, and wreathed with flowers in so elegant a style, as hardly to be excelled. A party of warriors were next introduced, dressed in their war habits, consisting, as has already been observed, of different coloured cloth, of their own manufacture, so ingeniously fashioned, and blended together with so much art, as, with the helmets that cover their heads, to fill the stage with men, of whose majestic figure it is not easy to conceive an idea. These were armed with spears, lances, and clubs; and exhibited all the forms of attack and defence, which are practised in real action. The principal performers were the king's brother, his three sisters, and we may add, a chief of a gigantic stature, who displayed such surprising grimaces and distortions of face and countenance, by way of provocation and challenge, as were not only laughable in some attitudes, but terrible in others. After these disappeared, the players came forward, and performed a more serious piece than we had yet seen, at which the natives sat graver and more composed than usual; though some comic interludes, wherein four men were performers, seemed to afford

greater entertainment to the numerous audience. The whole concluded with a dance of ten boys, dressed, in every respect like the girls in the first scene, with their hair flowing in ringlets down their shoulders, and their heads ornamented in a very beautiful style.

The next morning being the 3d, we proceeded to Matavai, leaving Otoo at Oparree; but his mother, sisters, in short all the royal family, and many women, attended us on board, and Otoo followed a short time after. During our absence from the ships, the supply of fruit had been scanty, nor had they many visitors; but after our return we had plenty both of company and provisions. On the 4th a party of us, among whom was Otoo, dined ashore with Omiah, who had provided excellent fare, consisting of fish, fowls, pork, and puddings. Dinner being over, the Captain accompanied Otoo to his house, where he found all his servants very busy in getting a quantity of provisions ready. Among other articles was a large hog, which they killed in his presence. There was also a large pudding, the whole process of which the Captain saw. It was composed of bread fruit, plantains, taro, and pandanus nuts, each rasped, scraped, or beat up very fine, and baked by itself. A quantity of the juice of cocoa-nut-kernels was put into a large tray, or wooden vessel; in which the other articles from the oven were put; together with some hot stones, in order to make the contents simmer. Three or four persons were employed in stirring up the several ingredients, till they were perfectly incorporated, and the juice of the cocoa-nut was turned to oil; and, at last, the whole mass was nearly of the consistency of a hasty pudding. Some of these puddings are excellent, and few that we make in England equal them. This being made, and the hog baked, they, together with two living hogs, some bread-fruit, and cocoa-nuts, were sent on board the Resolution, followed by Otoo, and all the royal family.

Friday the 5th, in the evening, a young ram of the cape breed, and carefully brought up on board our ship, was killed by a dog; an accident the more regretted, by its being the only one we had of that kind, and one only of the English breed was now remaining. On the 7th, at the close of day, we exhibited some fireworks, before a vast concourse of people, many of whom were highly entertained, but the greater number were much terrified with the exhibition; inasmuch, that they could hardly be prevailed on to keep together, to the conclusion of the entertainment. A table rocket was the last. It flew off the table, and dispersed the whole crowd in an instant; even the most resolute of them flew with the utmost precipitation. On Monday, the 8th, a party of us dined with Oedidee, who made the trip to the southward with Captain Cook, in his former voyage. Our table was furnished plentifully with fish of divers sorts, and pork. The hog, which weighed about thirty pounds, was alive, dressed, and on the table, within the hour. Soon after we had dined, Otoo came to us, and asked the Captain, if his belly was full? who answered in the affirmative. "Then come along with me," said Otoo. The Captain attended him to his father's, where he saw several people employed in dressing two girls, with fine cloth, after a very singular fashion. There were several pieces, one end of each was held over the heads of the girls, while the remainder was wrapped round their bodies under the arm-pits. The upper ends were then let fall, and hung in folds to the ground, over the other, so as to bear some resemblance to a circular hoop-petticoat: lastly, round the outside of all, were wrapped several pieces of cloth, of various colours, which considerably increased the size; it being five or six yards in circuit; and the weight of this singular attire was as much as the poor girls could well support. To each were hung two taamees, or breast-plates, in order to embellish the whole, and give it a picturesque appearance. Thus equipped, they were taken on board, together with several hogs, and a quantity of fruit, the whole being a present to our Commander from Otoo's father. Those who are dressed in this manner, are called *atec*; but, this ceremony is never performed, except

except where large presents of cloth are to be made. We never saw it practised upon any other occasion; but, both Captain Cook and Captain Clarke had cloth presented them afterwards wrapped round the bearers in the same manner. On the 9th, we received a present of five hogs, and some fruit, from Otoo; and one hog, and some fruit from each of his sisters. Other provisions were also in abundance; and great quantities of mackerel having been caught by the natives, for two or three days successively, some of them were sold at the tents, and in the ships; indeed, Otoo was equally attentive, to supply our wants, and contribute to our amusement. On the 10th he treated a party of us at Oparree with a play; in which his three sisters were again performers, having each of them new and very elegant dresses. This day Captain Cook went to see an embalmed corpse, near the residence of Otoo. On enquiry, it was found to be the remains of Tee, a chief well known to him, when he last visited this island. It was lying in an elegant toopapao, in all respects similar to that at Oheitepeha, in which the remains of Wahaiadooda are deposited. We found the body was under cover, within the toopapao, and wrapped up in cloth. At the Captain's desire, the person who had the care of it, brought it out, and placed it on a kind of bier, so as to allow a perfect view of it. The corpse having been thus exhibited, he ornamented the place with mats and cloths, disposed in such a manner as to produce a pleasing effect. The body was entire in every part; putrefaction seemed hardly to be begun; and not the least disagreeable smell proceeded from it; though this is one of the hottest climates, and Tee had been dead above four months. There was, indeed, a shrinking of the muscular parts and eyes, but the hair and nails were in their original state, and the several joints were pliable. On enquiry into the method of thus preserving their dead bodies, we were informed, that soon after they are dead, they are disembowelled, by drawing out the intestines, and other viscera; after which the whole cavity is stuffed with cloth; that, when any moisture appeared, it was immediately dried up, and the bodies rubbed all over with perfumed cocoa-nut oil, which, frequently repeated, preserved them several months; after which they moulder away gradually. Omiah told us, that the bodies of all their great men, who die a natural death, are thus preserved, and exposed to public view a considerable time after. At first, they are exhibited every fine day, afterwards the intervals become greater, and at last they are seldom to be seen. In the evening we took leave of Otoo, and departed from Oparree.

On Friday the 12th, all the royal family, except the king himself, honoured us with a visit. The chief, they said, was gone to Attahooroo, to assist at another human sacrifice, sent from Tiaraboo, to be offered up at the Morai. This second instance, within so short a period, was a melancholy proof, that the victims of this bloody superstition are very numerous among this humane people. The Captain would have been present at this sacrifice also, had he been earlier informed of it, but now it was too late. For the same reason, he missed being at a public transaction, the preceding day, when the king, with great solemnity, restored to the adherents of the late king Tootaha, the lands and possessions, of which, after his death, they had been deprived. On the 13th Otoo returned from exercising his royal duties; and on the 14th, we were honoured with his company, when the two Captains, for the first time, mounted on horseback, and rode round the plain of Matavai, to the astonishment of a vast train of spectators, who gazed upon them with as much surprise as if they had been centaurs. Both the horse and mare were in good case, and looked extremely well. What the Captains had began was repeated daily, by one or other of our people; and yet the curiosity of the natives continued unabated. After they had seen and understood the use of these noble animals, they were exceedingly delighted with them; and we were of opinion, that they conveyed to them a better idea of the greatness of other nations, than all the novelties that had hitherto been carried among them. On the 15th,

Etary, or Oila, the god of Bolabola, removed from our neighbourhood to Oparree, attended by several sailing canoes. It was said, Otoo did not approve of his being so near our station, where his people could conveniently invade our property. Otoo, we acknowledge, took every prudent method to prevent thefts and robberies, and it was owing principally to his regulations that so few were committed. He had erected a small house or two behind our post, and two others near our tents, between the river and the sea. Some of his people kept watch continually at all those places; and as his father resided usually on Matavai Point, we were, in a manner, surrounded by them. They not only defended us in the night from thieves, but they had an opportunity of observing every thing that passed in the day, and were ready to receive contributions from such girls, as were privately connected with our people, which was usually done every morning; so that the measures he had taken to secure our safety, answered the more essential purpose of enlarging his own profits. Otoo acquainted Captain Cook, that his presence was required at Oparree, where an audience was to be given to the great personage from Bolabola, and desired his company thither. The Captain consented readily, expecting to meet with something deserving of notice.

Accordingly, Tuesday the 16th, our party, among whom was Mr. Anderson, set out. Nothing, however, occurred, that was interesting or curious. Etary and his followers presented some coarse cloth, and hogs, to Otoo, with a set speech. After this, a consultation was held between them and some other chiefs, about their expedition to Eimeo. Etary, at first, disapproved of it; but his objections were, at length, over-ruled. It appeared, indeed, the next day, it was too late to deliberate on this business; for Towha, Potatou, and another chief, had already gone on the expedition, with the fleet of Attahooroo; and, in the evening, a messenger arrived with intelligence, that they had reached Eimeo; that there had been some skirmishes; but that the loss, or advantage, on either side, had been very inconsiderable. On the 18th, in the morning, Captain Cook, Mr. Anderson, and Omiah, went again to Oparree, accompanied by Otoo, taking with them the sheep which the Captain intended to leave upon the island. These were an English ram and ewe, and three Cape ewes, all which the Captain made a present of to Otoo. Each of the three cows had taken the bull; he therefore thought it advisable to divide them, and carry one part to Ulitea. With this view he ordered them to be brought before him, and proposed to Etary, that if he would leave his Spanish bull with Otoo, he should have our English bull and one of the cows. To this proposal Etary, at first, started some objections; but, at last, agreed to it. However, as the cattle were putting into the boat, one of Etary's followers opposed the making any exchange whatever. Upon this, and the Captain suspecting, that Etary had agreed to the arrangement, for the present, only to please him, he dropped the idea of an exchange; and determined finally to leave them all with Otoo; whom he strictly enjoined not to suffer them to be removed from Oparree, till he should have got a stock of young ones; which he might then dispose of to his friends, or send to the neighbouring islands. This matter being settled, our gentlemen left Etary, and attended Otoo to another place, not far distant, where they found the servants of a chief, waiting with a hog, a pig, and a dog, a present from their master to the king. These were delivered, with the usual ceremonies, and an harangue, in which the speaker enquired after the health of Otoo, and of all his principal people. This compliment was re-echoed in the name of Otoo, by one of his ministers; and then the dispute with Eimeo was formally discussed. The deputies of the chief were advocates for prosecuting the war with vigour, advising Otoo to offer a human sacrifice on the occasion. Another chief, who constantly attending the person of Otoo, took the other side of the question, and supported his opinion against a war, with great strength of argument. Otoo received repeated messages from Towha, urging him to hasten to his assistance; and the Captain

THE HISTORY OF THE
CITY OF LONDON
FROM THE FOUNDATION
TO THE PRESENT
TIME

The Fleet of OTUMHETTE, assembled at OPAREE.

Captain was now convinced that he never entered heartily into the spirit of this war. Having dined with Otoo, our party returned to Matavai, leaving him at Oparree.

On Friday, the 19th, we were very sparingly supplied with fruit, as we had been the day before. Otoo being informed of this, he, and his brother, who had particularly attached himself to Captain Clerke, came from Oparree, with a large supply for both ships. Next day, the 20th, all the royal family came with presents, so that now we had more provisions than we could consume. Our water and wood having been already taken on board, nothing remained but to strike the tents, and bring off the things belonging to the officers and men who were stationed on shore; and the Commodore began to think of quitting the island, that he might have sufficient time for visiting others in the neighbourhood. We therefore removed our observatories and instruments from the shore, and bent the sails. Several of the sailors being very desirous to stay at Otaheite, Otoo interested himself in their behalf, and endeavoured to prevail on Captain Cook to grant their request; but he rejected peremptorily every application of that kind, though often repeated; nor would he suffer any of the natives to enter on board, though many would gladly have accompanied us wherever we intended to sail, and that too after they were assured, that we never intended to visit their country any more. Some of the women also would have followed their Ehoonoas, or Pretanne husbands, could they have been permitted; but our Commander was equally averse to the taking any of the natives away, as to the leaving any of our own people behind. He was sensible, that when once cloyed with enjoyment, they would reciprocally pine for home, to which it would not be in their power to return; and that for a little present gratification, they would risk the happiness of the remaining part of their lives. The king, when he found he could not obtain his wishes in this respect, applied to Captain Cook for another favour, which was, to allow our carpenters to make him a chest, or press, to secure the treasures he had accumulated in presents: he even begged, that a bed might be placed in it, where he intended to sleep. This request the Captain readily granted; and while the workmen were employed, in making this uncommon piece of furniture, they were plentifully supplied with barbecued hogs, and such dainties as the country afforded, and were so carefully attended and protected, that they did not lose so much as a single nail. It was some of these workmen that Otoo was so desirous to retain; but they were of too much consequence on board to be parted with, had there been no other motive for bringing them away; nor was Otoo much concerned about the departure of the rest. While he was constant in attending the operations of our carpenters, Omiah had frequent conferences with him, on the subject of his travels. He astonished him more by the relation he gave of the magnificence of the Morais in Pretanne, than by all the wonders with which he had before surprized him. When he told him that the king's morai was open to all comers, and that the persons of the deceased kings were to be seen as perfect to appearance as when in the vigour of youth, he seemed to lament, that his date of existence was to be limited with his life; and that his remains were to perish, while his Morai preserved no memorial, that he had ever had a being. Omiah endeavoured to impress him with an idea of the magnificence of the tombs of the dead that were to be seen in the morais of Pretanne; but having nothing to compare them to, he was unable to make himself sufficiently understood; nor was he more successful in describing the solemn grandeur of the places of public worship, where the people assembled every seventh day, and at other stated times, to offer up their prayers to the good spirit. Of the splendor of the theatres he could speak more intelligibly. When Omiah told Otoo of the magnitude of the palaces, and houses, in Pretanne; of their decorations and furniture; of the extent of their plantations; and the multitude of living animals with which they were stocked; he listened to him with peculiar attention, as not doubting the truth of his relation; but when he attempted to describe the roads, and the rapidity with which people travel in carriages, drawn by four footed animals, he seemed all amazement: no child could ever express greater surprize at Gulliver's travelling to the moon on ganzas, than Otoo, when Omiah assured him, they could traverse an extent of ground equal to the whole length of the island of Otaheite, in a single day.
